Intersection #16: Laureles Grade Road / Highway 68 – Mitigation #8

1. Convert intersection to a roundabout

Conversion of this intersection to a roundabout, as proposed in TAMC's *SR 68 Scenic Highway Plan* study, would reduce the Project's impact (1 PM peak hour trip) to a less than significant level. Per the TAMC website, Measure X sales tax funds have been dedicated to the *SR 68 Scenic Highway Plan*, which is also a candidate for federal infrastructure funding and state funding from SB 1 programs. This impact could be mitigated by constructing the roundabout; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #17: Corral De Tierra Road / Highway 68 – Mitigation #4

1. Convert intersection to a roundabout

Conversion of this intersection to a roundabout, as proposed in TAMC's *SR 68 Scenic Highway Plan* study, would reduce the Project's impact (1 PM peak hour trip) to a less than significant level. Per the TAMC website, Measure X sales tax funds have been dedicated to the SR 68 Scenic Highway Plan, which is also a candidate for federal infrastructure funding and state funding from SB 1 programs. This impact could be mitigated by constructing the roundabout; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #18: San Benancio Road / Highway 68 – Mitigation #9

1. Convert intersection to a roundabout

Conversion of this intersection to a roundabout, as proposed in TAMC's *SR 68 Scenic Highway Plan* study, would reduce the Project's impact (1 PM peak hour trip) to a less than significant

level. Per the TAMC website, Measure X sales tax funds have been dedicated to the *SR 68 Scenic Highway Plan*, which is also a candidate for federal infrastructure funding and state funding from SB 1 programs. This impact could be mitigated by constructing the roundabout; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #19: Torero Drive / Highway 68 – Mitigation #5

1. Convert intersection to a roundabout

Conversion of this intersection to a roundabout, as proposed in TAMC's *SR 68 Scenic Highway Plan* study, would reduce the Project's impact (1 PM peak hour trip) to a less than significant level. Per the TAMC website, Measure X sales tax funds have been dedicated to the SR 68 Scenic Highway Plan, which is also a candidate for federal infrastructure funding and state funding from SB 1 programs. This impact could be mitigated by constructing the roundabout; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Road Segments #6, #7, #8 and #9

The Proposed Project Short-Term is expected to add zero AM peak hour and one PM peak hour trip to segments #6 through #9. This will not be enough of an increase in traffic to affect traffic operations on these segments. Background Plus Proposed Project Short-Term intersection levels of service (LOS) with mitigation are also summarized in **Tables 22** and **23**. Levels of service with the proposed roundabouts are identified by PI#1, PI#2, etc. (for Proposed Improvement #). The levels of service with the proposed roundabouts do not necessarily indicate the project has an impact at that location. Mitigated levels of service indicate locations where the project would have an impact, and are identified by M#1, M#2, etc. (for Mitigation #).

LOS calculation worksheets for signalized, stop-controlled, and roundabout-controlled intersections are included in **Appendix H**. Vehicle queue estimates are included as **Appendix I**.

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).

2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).

3 LOS highlighted in red indicates intersection operating below level of service standard.

4 * = delay greater than 300 seconds.

5 LOS in bold box indicates project impact.

6.3 Background Plus Alternative 1 Project Short-Term Traffic Conditions

6.3.1 Background Plus Alt. 1 Project Short-Term – Intersection Operations

The Alternative 1 Project Short-Term trip assignments described in Section 4.2.1 were combined with the Background conditions traffic volumes to obtain Background Plus Alternative 1 Project Short-Term AM and PM peak hour traffic volumes, which are shown in **Figures 28** and **29**.

Based on the City of Monterey and Caltrans level of service standards, the following study intersections are projected to operate deficiently under Background Plus Alternative 1 Project Short-Term traffic conditions:

Intersection #1 – Olmsted Road / Highway 68
Intersection #6 – Del Monte Boulevard / Highway 218
Intersection #7 – Highway 218 / Fremont Boulevard
Intersection #9 – Highway 218 / Del Rey Gardens Drive
Intersection #11 – Josselyn Canyon Road / Highway 68
Intersection #14 – York Road / Highway 68
Intersection #15 – Pasadera Drive / Highway 68
Intersection #16 – Laureles Grade Road / Highway 68
Intersection #17 – Corral De Tierra Road / Highway 68
Intersection #18 – San Benancio Road / Highway 68
Intersection #19 – Torero Drive / Highway 68

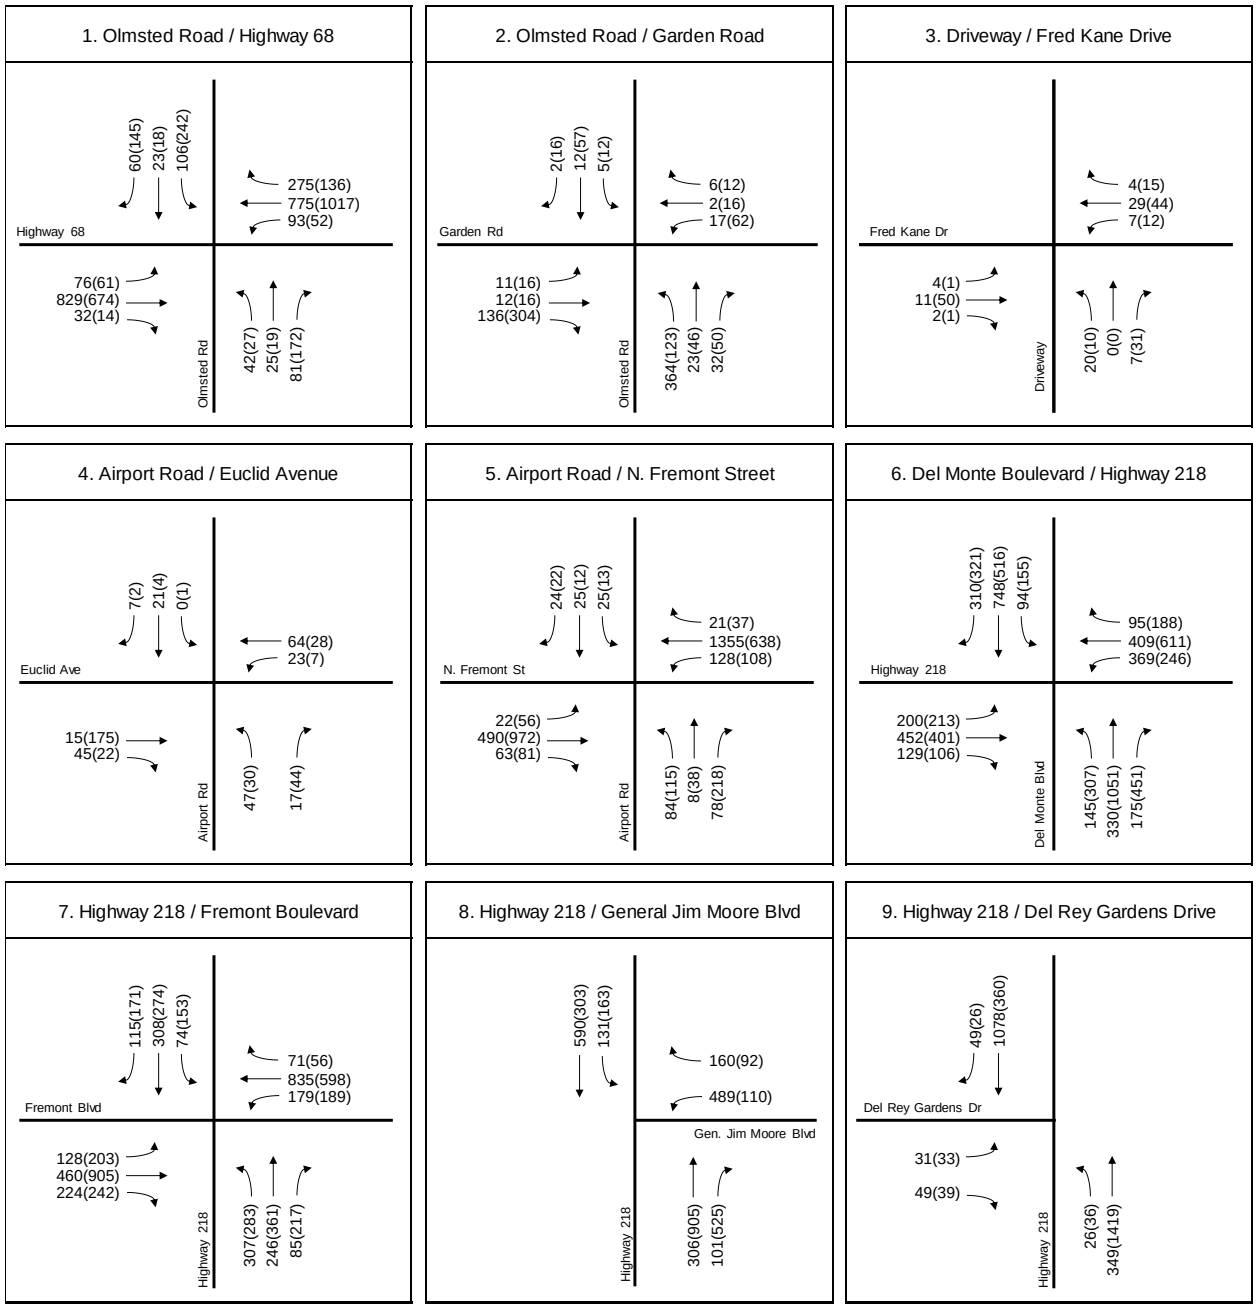
It should be noted that these intersections would also operate at deficient levels of service without the Alternative 1 Project.

6.3.2 Background Plus Alt. 1 Project Short-Term – Road Segment Operations

Road segment operations under Background Plus Alternative 1 traffic conditions are discussed here qualitatively. The following road segments operate deficiently under Existing conditions and would continue to operate deficiently with the added traffic under Background Plus Alternative 1 traffic conditions:

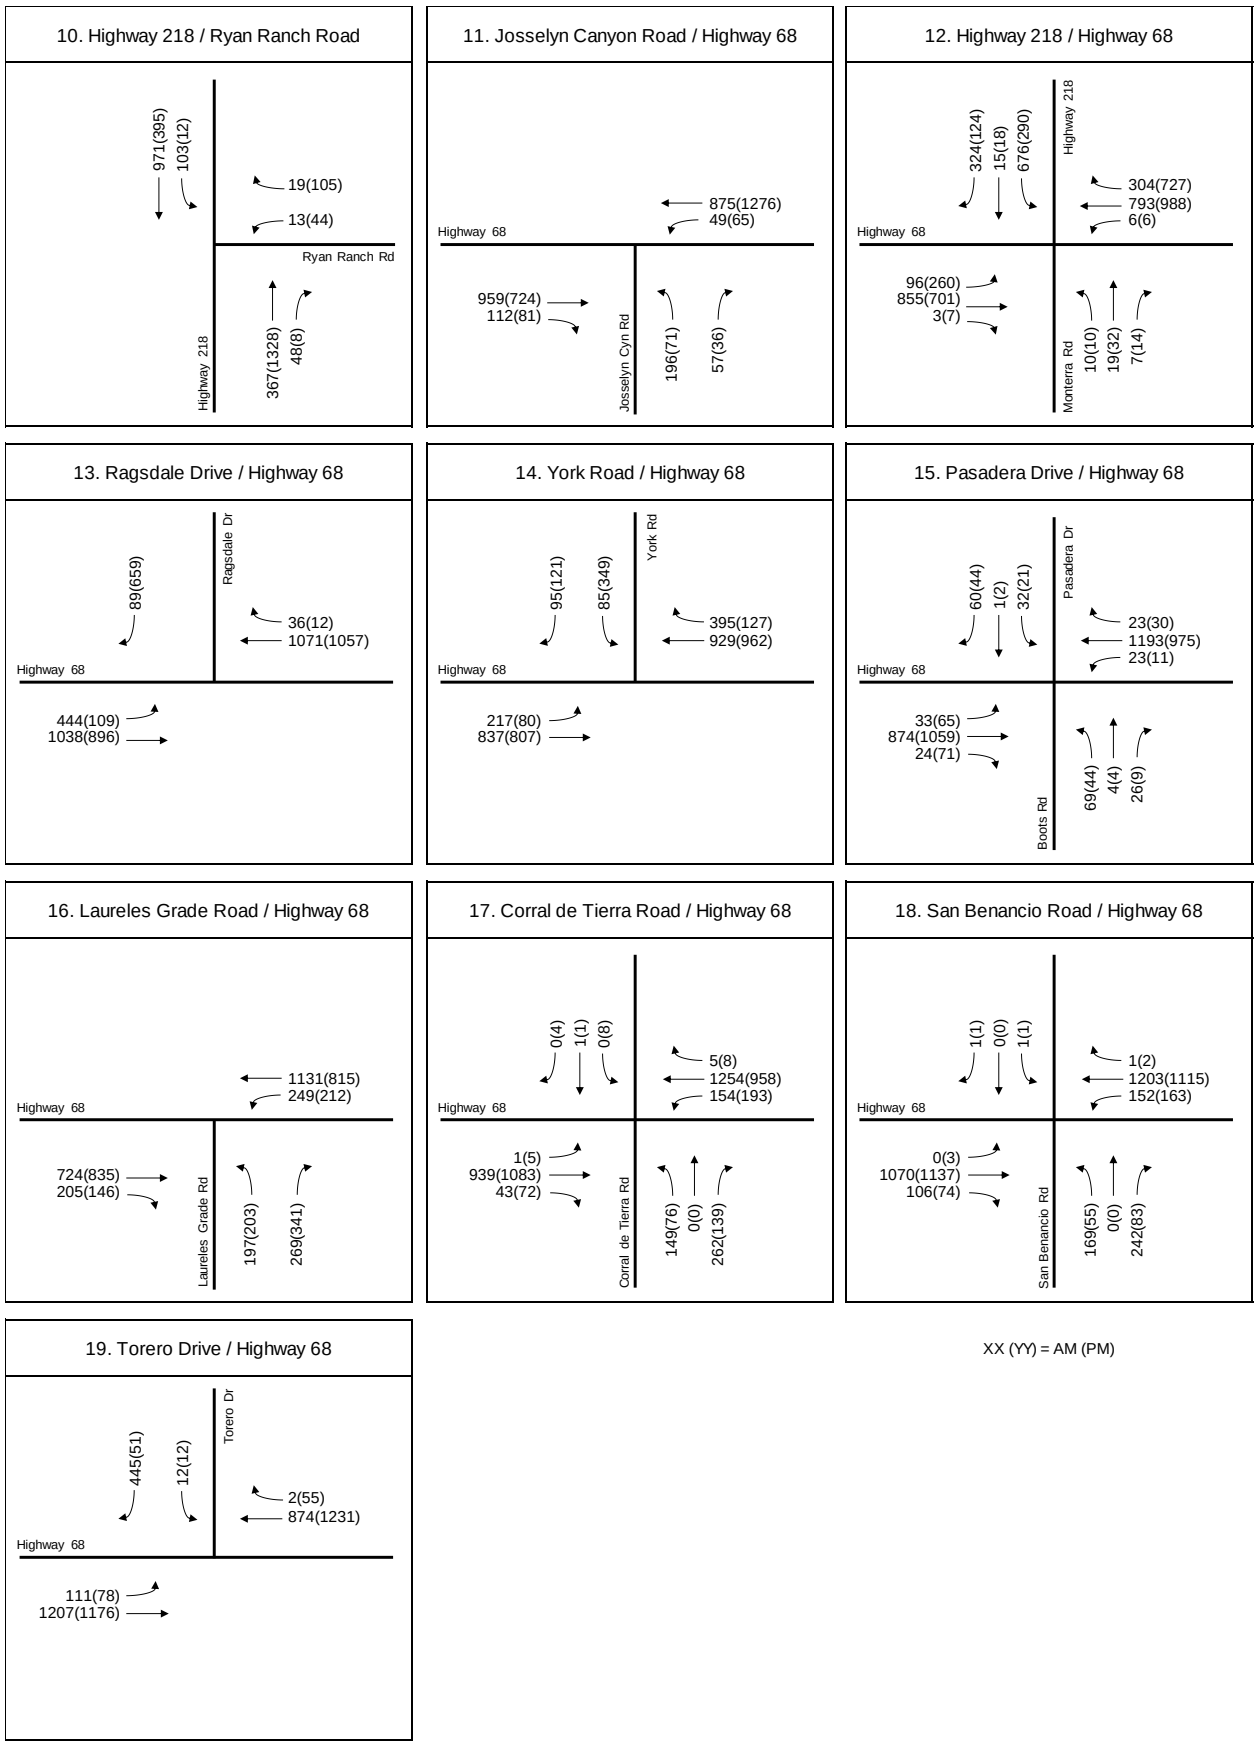
Segment #2 – Highway 68, from Begin/End Freeway to Josselyn Canyon Road
Segment #3 – Highway 68, from Josselyn Canyon Road to Olmsted Road
Segment #4 – Highway 68, from Olmsted Road to Highway 218
Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade
Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road
Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive
Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

Figure 28: Background Plus Alt. 1 Project Short-Term Volumes (1 – 9)



XX (YY) = AM (PM)

Figure 29: Background Plus Alt. 1 Project Short-Term Volumes (10 – 19)



6.3.3 Background Plus Alt. 1 Project Short-Term – Project Impacts

Based on the criteria for project impacts, the Project would have a significant impact at the following intersections under Background Plus Alternative 1 Project Short-Term conditions (**Tables 24** and **25**):

Intersection #6 – Del Monte Boulevard / Highway 218

Intersection #7 – Highway 218 / Fremont Boulevard

Intersection #9 – Highway 218 / Del Rey Gardens Drive

Based on the Caltrans impact criteria, the addition of a single project trip at an intersection that is operating deficiently can be considered an impact. Although intersections #1, #11, #14, #15, #16, #17, #18, and #19 (all Caltrans intersections) would operate deficiently under Background Plus Alternative 1 Project Short-Term conditions (and under Background without project traffic conditions), the Project would not impact these intersections either because a) the redistribution of traffic that would occur with the relocation of the existing hangars would result in an overall reduction of traffic at the intersection or b) the Project is not expected to add traffic to the intersection during the peak hour that is operating deficiently. Under these circumstances, the Project would not trigger a significant impact under any of the applicable thresholds.

Based on the criteria for project impacts, the Project would have a significant impact on the following road segments under Background Plus Alternative 1 Project Short-Term conditions:

Segment #4 – Highway 68, from Olmsted Road to Highway 218

6.3.4 Background Plus Alt. 1 Project Short-Term – Mitigation Measures

The improvements listed below are recommended to mitigate the Project's impacts under Background Plus Alternative 1 Project Short-Term conditions. As discussed at Draft EIR sections 4.16. and 5.5.16, and at Draft EIR Appendix N, the improvements, however, may not be feasible if disallowed by federal law; federal law states that airport revenues and Federal Aviation Administration (FAA) grant funds may not be used for purposes other than the capital or operating costs of the airport, the local airport system, or other local facilities owned or operated by the airport owner or operator that are directly and substantially related to the air transportation of passengers and property. These restrictions impact the Airport's ability to fund and implement off-airport mitigation measures. Now that the Airport has identified specific mitigation measures for Proposed Project cumulative impacts, it can make specific requests to the FAA, where appropriate, for it to allow funding of off-airport mitigation measures.

At this time, however, because the Airport does not currently have a determination from the FAA that funding for any off-airport mitigation improvements will be allowed, the following mitigation measures are considered infeasible:

Intersection #6: Del Monte Boulevard / Highway 218 – Mitigation #6

1. Add 2nd Northbound Del Monte Blvd Left-Turn Lane
2. Add Northbound Del Monte Blvd Right-Turn Overlap Phasing
3. Add Southbound Del Monte Blvd Right-Turn Overlap Phasing

Implementation of these improvements would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total

cost of these improvements, based on the relative number of project trips it would add to the intersection (4 AM and 4 PM peak hour trips).

However, these improvements would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement these improvements. In addition, even with the Project's fair-share contribution, there is no guarantee that there would be sufficient funding available to implement these improvements. This impact could be mitigated by constructing the left-turn lane and implementing overlap phasing; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #7: Highway 218 / Fremont Boulevard – Mitigation #2

1. Add 2nd Northbound Highway 218 Left-Turn Lane

Implementation of this improvement would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of this improvement, based on the relative number of project trips it would add to the intersection (4 AM and 4 PM peak hour trips).

However, this improvement would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement this improvement. In addition, even with the Project's fair-share contribution, there is no guarantee that there would be sufficient funding available to implement this improvement. This impact could be mitigated by constructing the left-turn lane; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #9: Highway 218 / Del Rey Gardens Drive – Mitigation #7

1. Signalize Intersection
2. Add 2nd Northbound Highway 218 Through Lane
3. Add 2nd Southbound Highway 218 Through Lane

Implementation of these improvements would reduce the Project's impact (18 AM and 20 PM peak hour trips) to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of these improvements, based on the relative number of project trips it would add to the intersection.

However, these improvements would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement these improvements. In addition, even with the Project's fair-share contribution, there is no guarantee that there would be sufficient funding available to implement these improvements. This impact could be mitigated by signalizing the intersection and constructing the through lanes; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Background Plus Alternative 1 Project Short-Term intersection levels of service (LOS) with mitigation are also summarized in **Tables 24** and **25**. Levels of service with the proposed roundabouts are identified by PI#1, PI#2, etc. (for Proposed Improvement #). The levels of service with the proposed roundabouts do not necessarily indicate the project has an impact at that location. Mitigated levels of service indicate locations where the project would have an impact, and are identified by M#1, M#2, etc. (for Mitigation #).

LOS calculation worksheets for signalized, stop-controlled, and roundabout-controlled intersections are included in **Appendix H**. Vehicle queue estimates are included in **Appendix I**.

Road Segment #4

The Alternative 1 Project Short-Term is expected to add only 3 AM peak hour 4 PM peak hour trips to segment #4. This will not be enough of an increase in traffic to affect traffic operations on these segments.

Table 24: Background Plus Alt. 1 Project Short-Term – Intersection LOS (1 – 9)

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).

2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).

3 LOS highlighted in red indicates intersection operating below level of service standard.

4 * = delay greater than 300 seconds.

5 LOS in bold box indicates project impact.

7 Cumulative Traffic Conditions

This section describes traffic operations in the study area under Cumulative conditions, within a timeframe of approximately 20 years. This scenario does not include trips generated by the Project, but does include trips generated by increased enplanements at the Airport unrelated to the proposed Project, as well as other development projects in the study area.

7.1 Cumulative Traffic Volumes

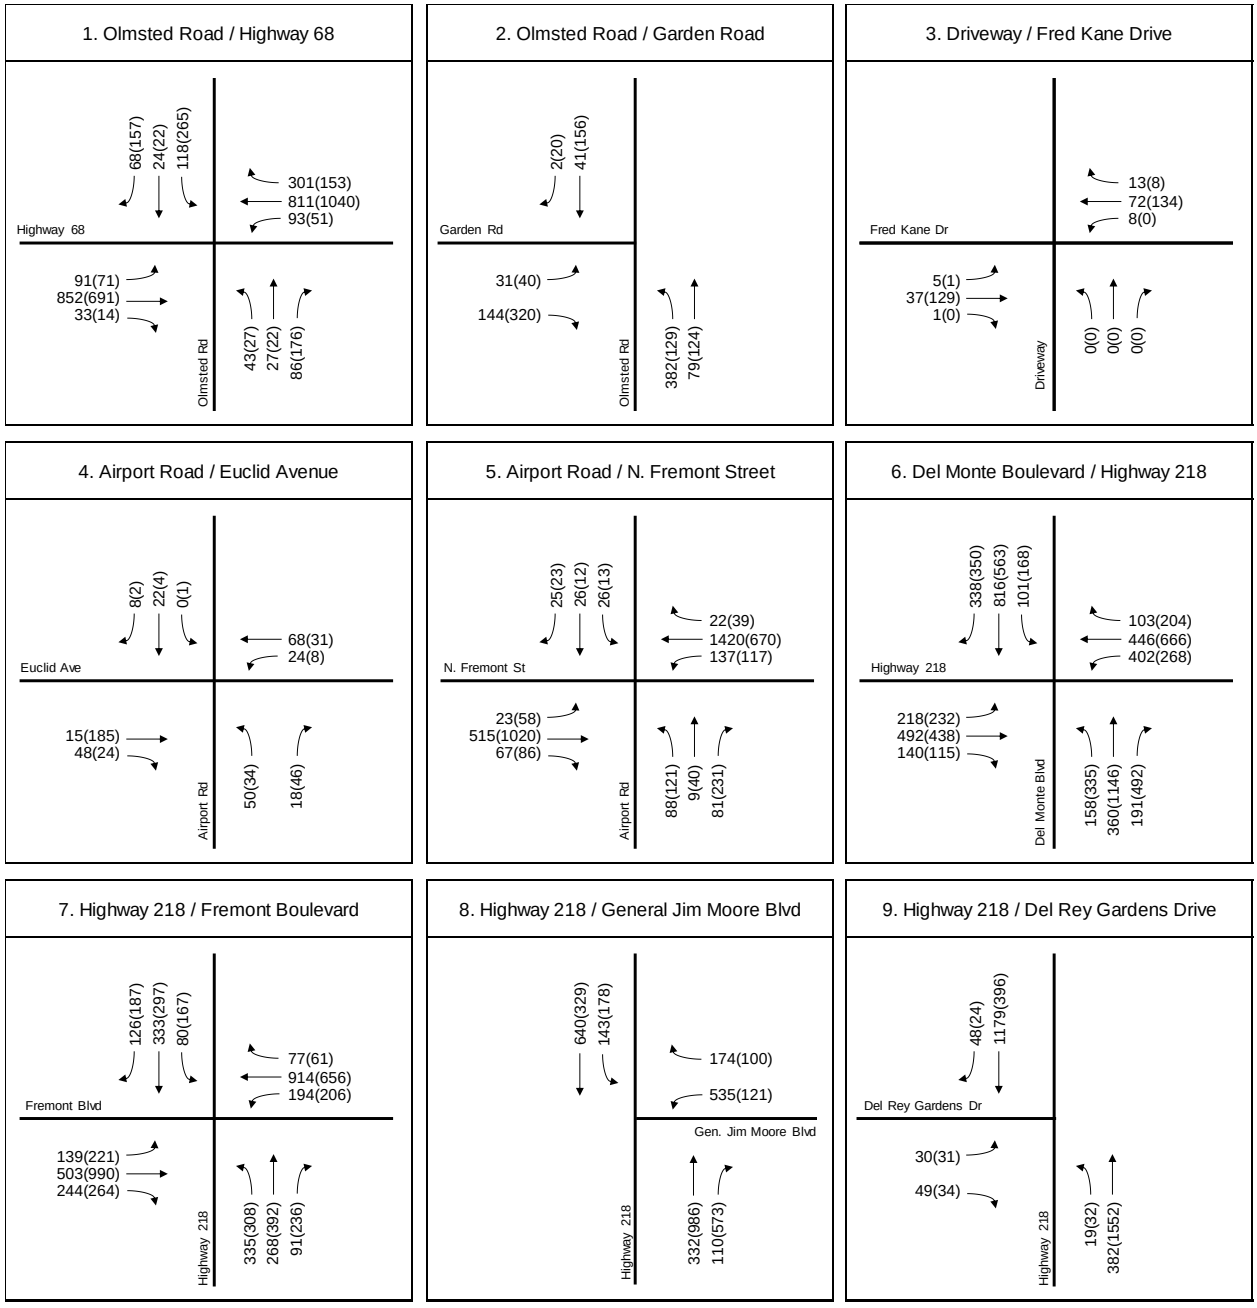
Anticipated growth in the boarding of passengers (i.e., enplanements) is expected to occur with or without the implementation of the Project. Trips generated by increased enplanements at the Airport under Cumulative conditions were estimated based on aviation forecast projections in the Airport's updated draft Final Airport Master Plan (AMP), which represent projected aviation demand for a twenty-year planning horizon. The aviation forecast projections are based on anticipated regional and national growth in aviation demand and are not due to changes in capacity at the Airport.

The Airport's enplanements, which were 197,322 in 2016, are projected to reach 245,000 in the ten-year planning horizon, representing an increase of approximately 24%. For the twenty-year planning horizon, an increase of approximately 48% was assumed. To account for this projected increase, trips generated by the Airport in 2016 (based on traffic counts at the Airport's access points) were increased by 48% to estimate the trips generated by increased enplanements in the twenty-year planning horizon. As is the case with the existing trips generated by the Airport, the trips associated with the increased enplanements include trips made by employees, support services, etc.

In addition, trips from development external to the Airport were estimated based on approved and proposed projects in the study area that have not yet been constructed, and future traffic volume forecasts developed for the *SR 68 Scenic Highway Plan* study (August 2017). The list of proposed projects and their trip generation in the study area and a map of their locations are included in **Appendix P**.

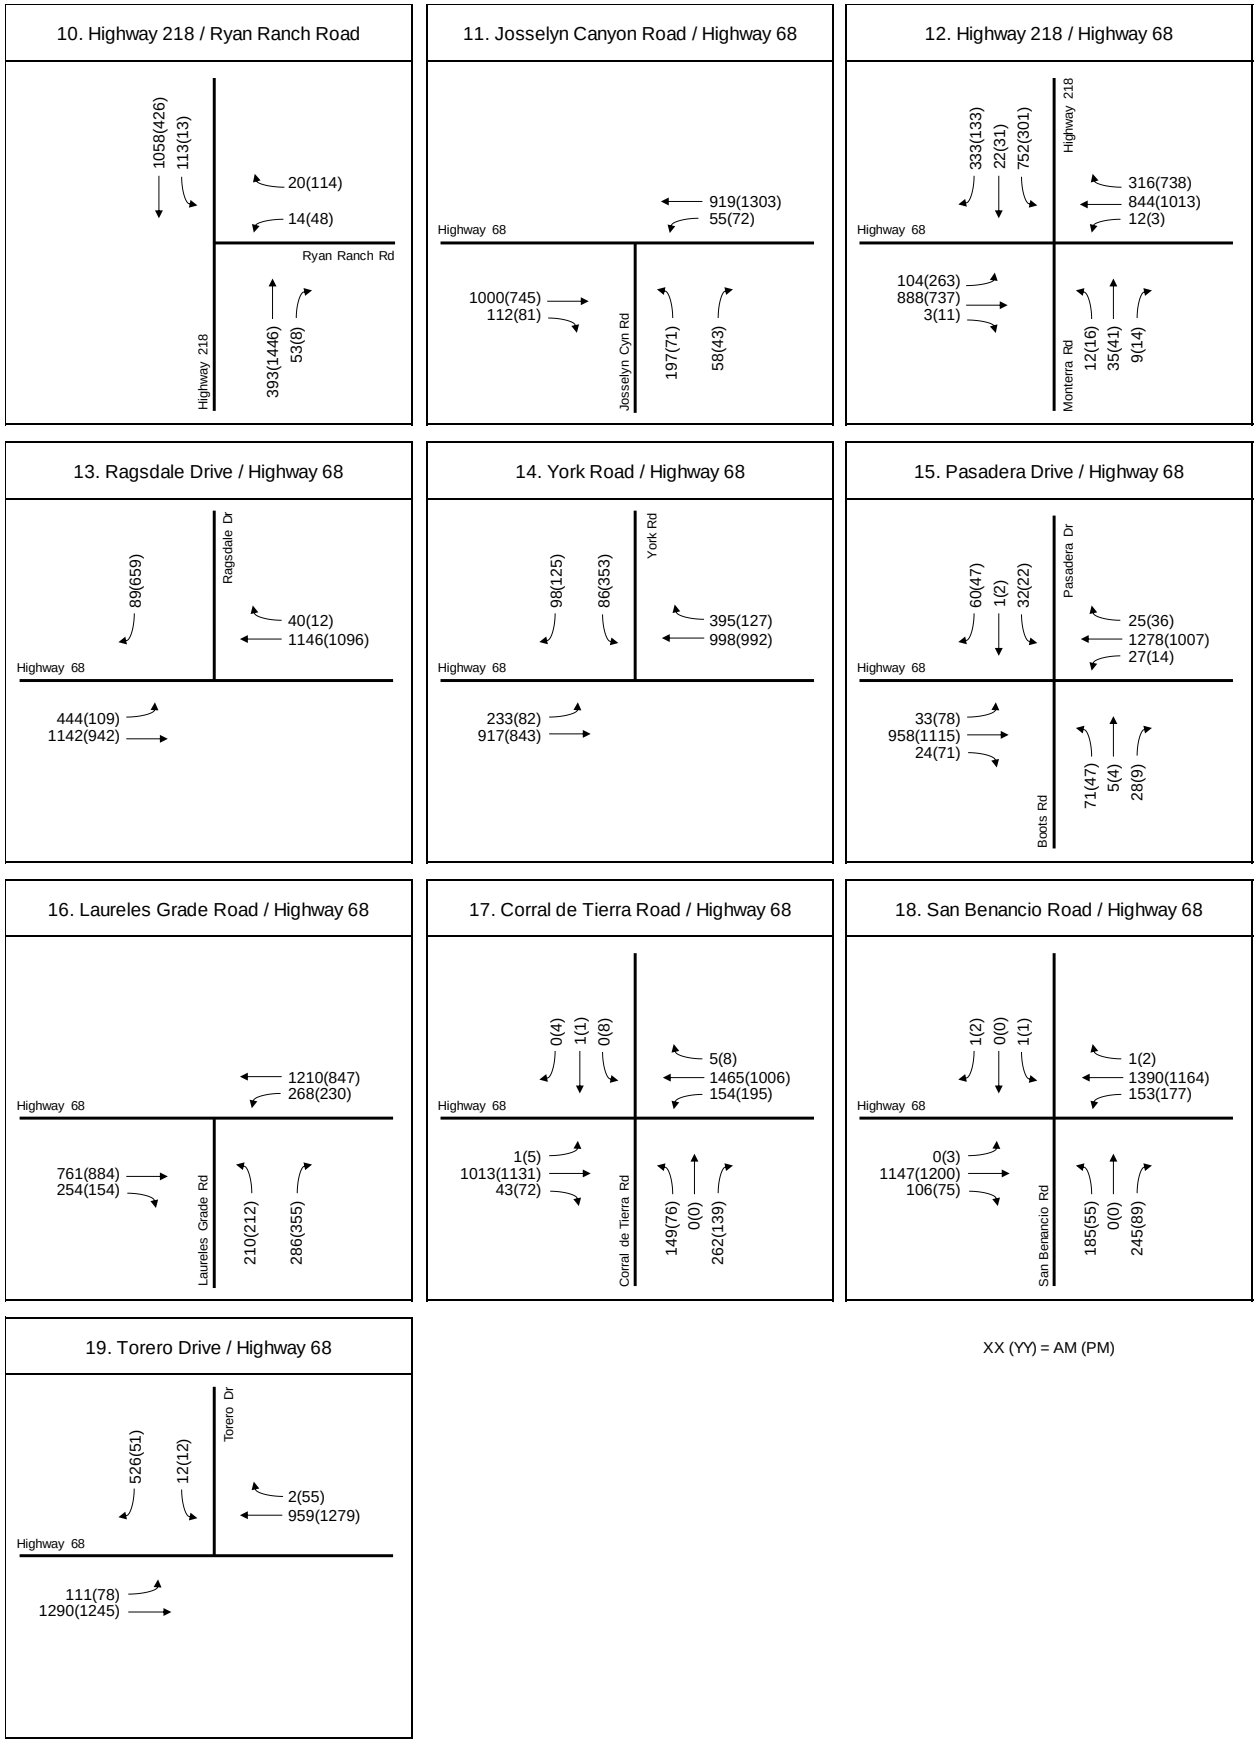
In assessing Cumulative traffic conditions, trips from increased enplanements and from development external to the Airport were combined and added to the Existing conditions traffic volumes to obtain Cumulative conditions traffic volumes. Cumulative weekday AM and PM peak hour traffic volumes are shown in **Figures 30** and **31.**

Figure 30: Cumulative Volumes (1 – 9)



XX (YY) = AM (PM)

Figure 31: Cumulative Volumes (10 – 19)



7.2 Cumulative Intersection Operations

Based on the City of Monterey and Caltrans level of service standards, the following study intersections are projected to operate deficiently under Cumulative traffic conditions:

Intersection #1 – Olmsted Road / Highway 68

Intersection #6 – Del Monte Boulevard / Highway 218

Intersection #7 – Highway 218 / Fremont Boulevard

Intersection #9 – Highway 218 / Del Rey Gardens Drive

Intersection #10 – Highway 218 / Ryan Ranch Road

Intersection #11 – Josselyn Canyon Road / Highway 68

Intersection #12 – Highway 218 / Highway 68

Intersection #14 – York Road / Highway 68

Intersection #15 – Pasadera Drive / Highway 68

Intersection #16 – Laureles Grade Road / Highway 68

Intersection #17 – Corral De Tierra Road / Highway 68

Intersection #18 – San Benancio Road / Highway 68

Intersection #19 – Torero Drive / Highway 68

Cumulative conditions intersection levels of service are summarized in **Tables 26** and **27**. (The Mitigation and Proposed Project Improvements listed in this table reflect the improvements identified in the short-term analysis.) LOS calculation worksheets are included in **Appendix H**. Vehicle queue estimates are included in **Appendix I**.

7.3 Cumulative Road Segment Operations

Road segment operations under Cumulative traffic conditions are discussed here qualitatively. The following road segments operate deficiently under Existing conditions and would continue to operate deficiently with the added traffic under Cumulative traffic conditions:

Segment #2 – Highway 68, from Begin/End Freeway to Josselyn Canyon Road

Segment #3 – Highway 68, from Josselyn Canyon Road to Olmsted Road

Segment #4 – Highway 68, from Olmsted Road to Highway 218

Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade

Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road

Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive

Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

8 Cumulative Plus Project Long-Term Traffic Conditions

This section describes traffic operations in the study area under Cumulative traffic conditions with the addition of Project traffic under the two long-term project alternatives, namely; Proposed Project Long-Term and Alternative 1 Project Long-Term traffic conditions. Since the analysis addresses a conservative long-term buildout of the proposed AMP, both alternatives are the same in the long term with the exception of where the permanent ARFF building is relocated (i.e., south of the airfield [Proposed Project] or north of the airfield [Alternative 1 Project]).

The Long-Term development scenarios contain a variety of non-aviation land uses, including General Light Industrial and Office Park on the north side of the Airport, and High-Turnover Restaurant, Medical-Dental Office, and General Office on the south side of the Airport. These non-aviation land uses were chosen to represent a conservative, high-level assessment of the possible road network improvements that may be required to accommodate the intensity of these types of development. They also include future ultimate buildout of the north side GA area.

The analysis associated with these Long-Term non-aviation land uses was only considered at a programmatic level. Site-specific traffic studies would be required before any of these non-aviation land uses could be developed.

8.1 Proposed Project Long-Term Traffic Conditions

8.1.1 Proposed Project Long-Term – Trip Generation, Distribution, and Assignment

Trip generation rates are based on rates published in the Institute of Transportation Engineers (ITE) *Trip Generation*, 9th Edition, 2012, where appropriate. The ITE *Trip Generation* manual does not contain appropriate rates for the Port-a-Port T-hangars, the Monterey Navy Flying Club, or the General Aviation hangars. The trip generation rates for these land uses were therefore developed based on actual gate counts at the Airport's existing hangar gates. The gate counts were collected between November 1 and December 31, 2016.

As discussed in Section 3.2.3, the Proposed Project Long-Term scenario includes a combination of actions and development that would reduce traffic at some locations and increase traffic at other locations within the study area. This scenario also includes high-intensity development on the north and south sides of the Airport. This scenario would result in a total net new trip generation of 10,991 daily trips, with 1,370 occurring during the AM peak hour (1,164 in, 206 out) and 1,368 occurring during the PM peak hour (265 in, 1,103 out). Details of the Proposed Project Long-Term trip generation are provided in **Table 28**.

The Long-Term Project trips were assigned to the study intersections using the same distribution percentages used for the Proposed Project Short-Term scenario. Although the Proposed Project Short-Term and Long-Term land uses are different (i.e., General Aviation vs General Light Industrial, Office Park, High-Turnover Restaurant, Medical-Dental Office, and General Office), the same trip distribution percentages were used, as they are based on the relative sizes and locations of population areas in the region, and the assumption that areas

with higher populations would contribute more traffic to the project site than areas with lower populations. The increases and reductions in trips from the relocated hangars were added to the new trips generated by the new hangars and the long-term non-aviation development to obtain the Proposed Project Long-Term AM and PM peak hour trip assignments, which are shown in **Figures 32** and **33**.

Table 28: Proposed Project Long-Term Trip Generation

Proposed Project Long-Term		WEEK DAY	WEEKDAY AM PK HR			WEEKDAY PM PK HR

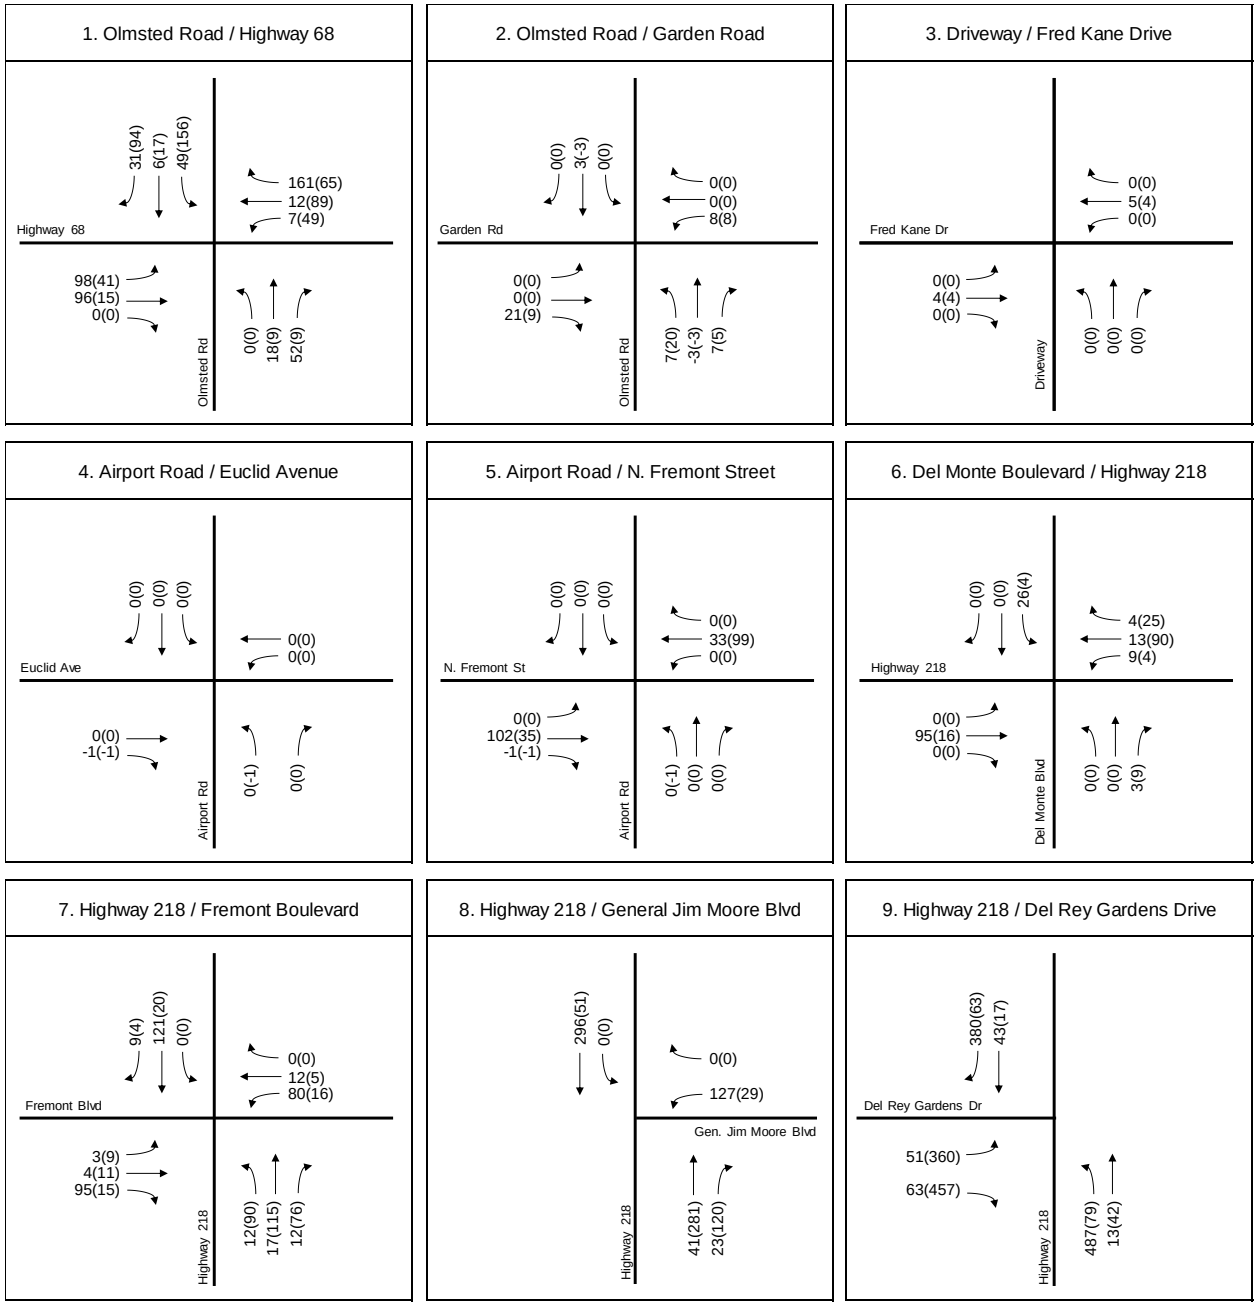
High-Turnover Restaurant	10,000	1,272	108	59	49	99	59	40
Medical-Dental Office	45,000	1,625	108	85	23	142	40	102
General Office	94,000	1,253	182	160	22	184	31	153
Total Net New Generated Trips		**10,991**	**1,370**	**1,164**	**206**	**1,368**	**265**	**1,103**

Notes:

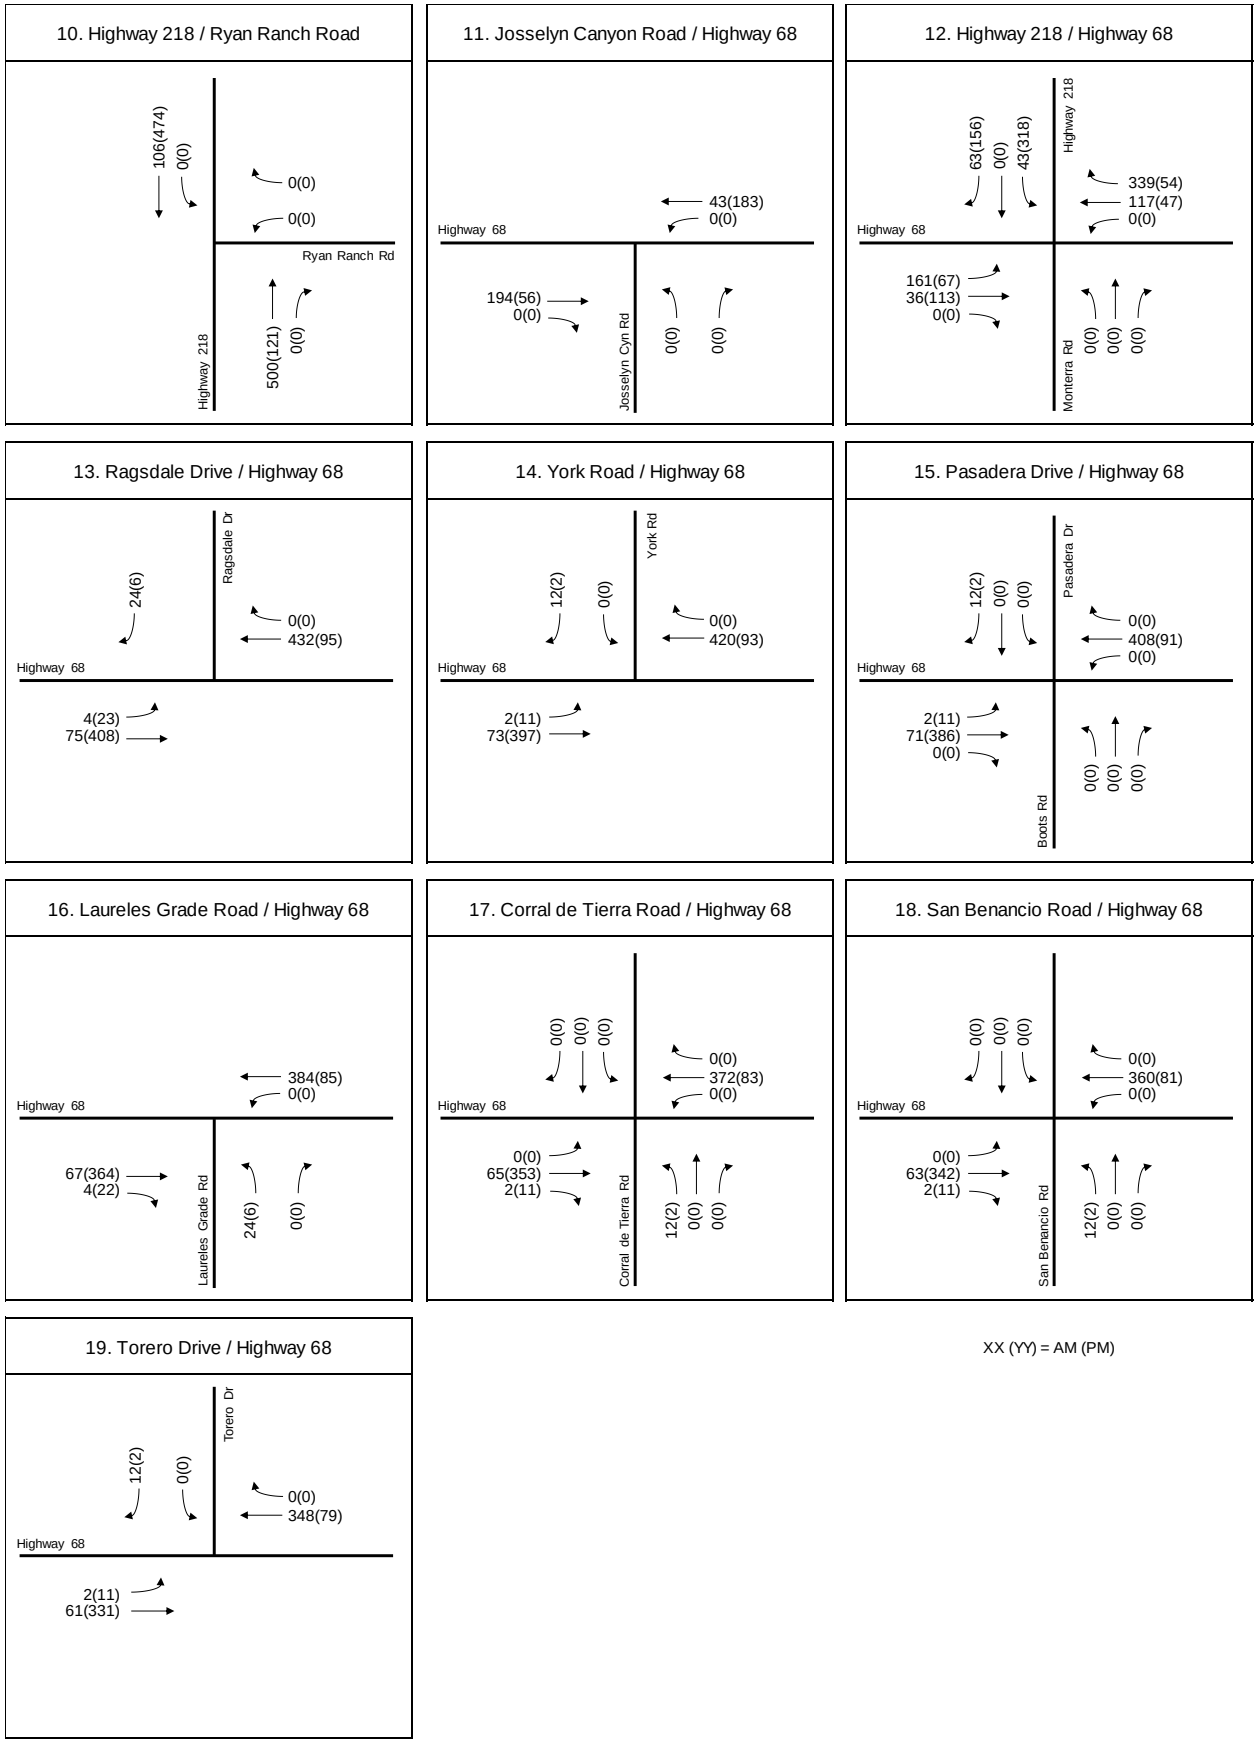
1. Trip generation rates from Institute of Transportation Engineers (ITE) *Trip Generation*, 9th Edition, 2012, where appropriate.
2. Trip generation rates for hangars based on gate counts at Monterey Regional Airport (November 1 - December 31, 2016).
3. Relocated trips in red are subtracted from their current access point and added to the north side via the North Side Road.
4. The 44 hangars relocated from the south side are included in the 51 hangars on the north side.

Figure 32: Proposed Project Long-Term Trip Assignment (1 – 9)



XX (YY) = AM (PM)

Figure 33: Proposed Project Long-Term Trip Assignment (10 – 19)



8.1.2 Cumulative Plus Proposed Project Long-Term – Intersection Operations

The Proposed Project Long-Term trip assignments were combined with the Cumulative conditions traffic volumes to obtain Cumulative Plus Proposed Project Long-Term AM and PM peak hour traffic volumes, which are shown in **Figures 34** and **35**.

Based on the City of Monterey and Caltrans level of service standards, the following study intersections would operate deficiently under Cumulative Plus Proposed Project Long-Term traffic conditions (**Table 29**):

Intersection #1 – Olmsted Road / Highway 68
Intersection #6 – Del Monte Boulevard / Highway 218
Intersection #7 – Highway 218 / Fremont Boulevard
Intersection #8 – Highway 218 / General Jim Moore Boulevard
Intersection #9 – Highway 218 / Del Rey Gardens Drive
Intersection #10 – Highway 218 / Ryan Ranch Road
Intersection #11 – Josselyn Canyon Road / Highway 68
Intersection #12 – Highway 218 / Highway 68
Intersection #14 – York Road / Highway 68
Intersection #15 – Pasadera Drive / Highway 68
Intersection #16 – Laureles Grade Road / Highway 68
Intersection #17 – Corral De Tierra Road / Highway 68
Intersection #18 – San Benancio Road / Highway 68
Intersection #19 – Torero Drive / Highway 68

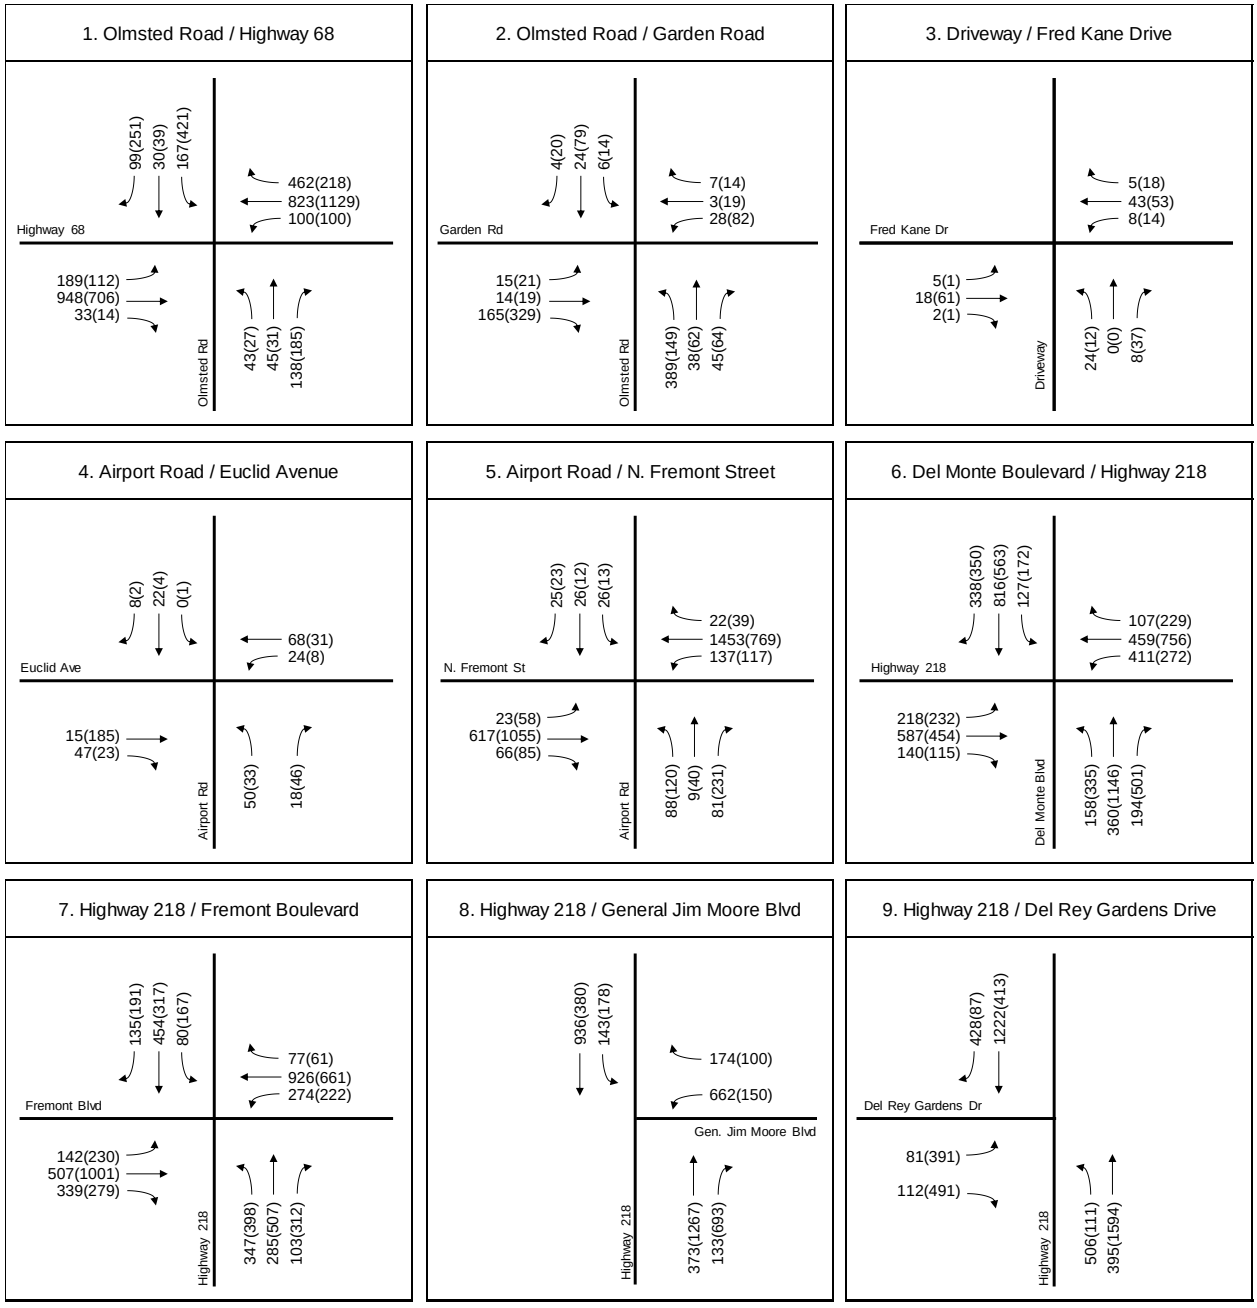
It should be noted that these intersections would also operate at deficient levels of service under Cumulative without Project conditions.

8.1.3 Cumulative Plus Proposed Project Long-Term – Road Segment Operations

Road segment operations under Cumulative Plus Project Long-Term traffic conditions are discussed here qualitatively. The following road segments operate deficiently under Existing conditions and would continue to operate deficiently with the added traffic under Cumulative Plus Proposed Project Long-Term traffic conditions:

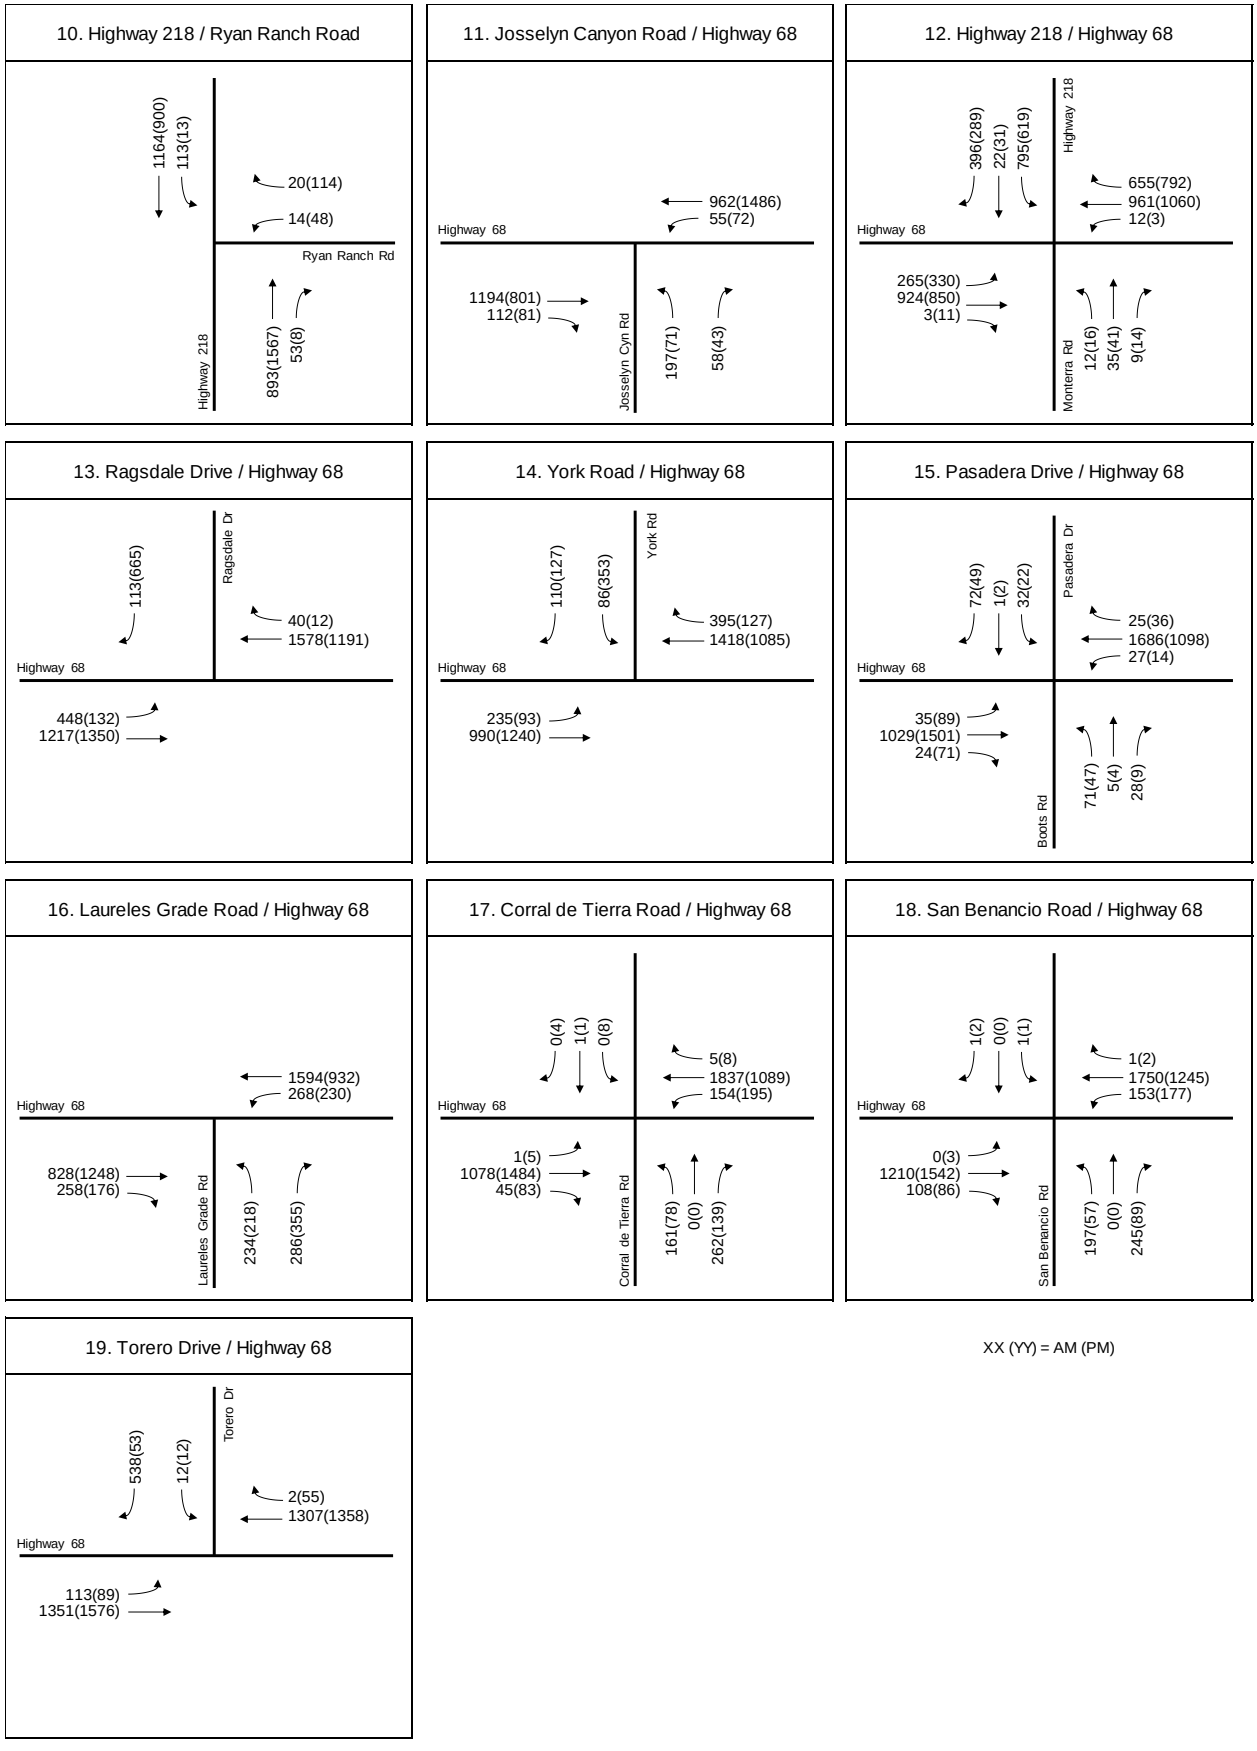
Segment #2 – Highway 68, from Begin/End Freeway to Josselyn Canyon Road
Segment #3 – Highway 68, from Josselyn Canyon Road to Olmsted Road
Segment #4 – Highway 68, from Olmsted Road to Highway 218
Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade
Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road
Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive
Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

Figure 34: Cumulative Plus Proposed Project Long-Term Volumes (1 – 9)



XX (YY) = AM (PM)

Figure 35: Cumulative Plus Proposed Project Long-Term Volumes (10 – 19)



8.1.4 Cumulative Plus Proposed Project Long-Term – Project Impacts

Based on the criteria for project impacts, the Project would have a significant cumulative impact at the following intersections under Cumulative Plus Proposed Project Long-Term conditions:

Intersection #1 – Olmsted Road / Highway 68
Intersection #6 – Del Monte Boulevard / Highway 218
Intersection #7 – Highway 218 / Fremont Boulevard
Intersection #8 – Highway 218 / General Jim Moore Boulevard
Intersection #9 – Highway 218 / Del Rey Gardens Drive
Intersection #10 – Highway 218 / Ryan Ranch Road
Intersection #11 – Josselyn Canyon Road / Highway 68
Intersection #12 – Highway 218 / Highway 68
Intersection #14 – York Road / Highway 68
Intersection #15 – Pasadera Drive / Highway 68
Intersection #16 – Laureles Grade Road / Highway 68
Intersection #17 – Corral De Tierra Road / Highway 68
Intersection #18 – San Benancio Road / Highway 68
Intersection #19 – Torero Drive / Highway 68

Cumulative Plus Proposed Project Long-Term intersection levels of service (LOS) are summarized in **Table 29**. LOS calculation worksheets are included in **Appendix H**. Vehicle queue estimates are included in **Appendix I**.

8.1.5 Cumulative Plus Proposed Project Long-Term – Mitigation Measures

As discussed in the Executive Summary, the Proposed Project Long-Term scenario includes conservative development with a corresponding high trip generation estimate. It is anticipated that this level of development would require major improvements to the local and regional road network to mitigate the project's impacts.

A detailed analysis of these major improvements is beyond the scope of this study. However, the following discussion presents a high-level assessment of some of the major improvements that may be required to achieve acceptable LOS C traffic operations in the study area under Cumulative Plus Proposed Project Long-Term traffic conditions.

Highway 218 Corridor

It is anticipated that two Highway 218 through lanes would be required in each direction at the Highway 218 intersections with Del Monte Boulevard, N. Fremont Street, General Jim Moore Boulevard, Del Rey Gardens Drive, and Ryan Ranch Road. Two lanes in each direction would probably also be required at other intersections along the corridor, and possibly along the entire length of the corridor. As discussed in Section 1.6, TAMC is in the beginning stages of conducting a Highway 218 Corridor Study. When completed, the Highway 218 Corridor Study is expected to provide information regarding potential strategies for improving the corridor. Caltrans has also anticipated the widening of Highway 218, as described in a 2009 Caltrans "Transportation Planning Fact Sheet."

At the Highway 218 / Highway 68 intersection, the Highway 68 approaches are expected to require dual eastbound left-turn lanes, three westbound through lanes, and dual westbound

right-turn lanes, while the southbound Highway 218 approach is expected to require triple southbound left-turn lanes and dual southbound right-turn lanes.

The Highway 218 / Del Rey Gardens Drive intersection would provide the only access to the development on the north side of the Airport. As a result, all traffic to the north side of the Airport would be concentrated at this intersection. At the Highway 218 / Del Rey Gardens Drive intersection, northbound Highway 218 is expected to require triple northbound left-turn lanes (in addition to two northbound and two southbound through lanes), and eastbound Del Rey Gardens Drive is expected to require dual left-turn lanes and dual right-turn lanes. The existing northbound left-turn lane at this intersection is extremely short (about 50 feet long), and is back-to-back with the southbound left-turn lane at the Monterey Peninsula School District driveway, which is only about 100 feet south of Del Rey Gardens Drive. To allow the widening of Highway 218 and the additional turn lanes at this location, the school district driveway may have to be realigned to form a four-legged intersection with Del Rey Gardens Drive. Realigning the school district driveway would require significant earthwork due to the steep embankment on the east side of Highway 218.

Highway 68 Corridor

As discussed in Section 1.5, the *SR 68 Scenic Highway Plan* study identified a series of improvements along Highway 68 to relieve congestion and improve safety and reliability along the corridor, with improvements phased in over a 20-year timeframe. “Roundabout Corridor: Concept 1 – Modified”, the Preferred Corridor Concept in the *SR 68 Scenic Highway Plan* study, includes converting nine of the Highway 68 study intersections in this study to roundabout control.

The Monterey Peninsula Airport District, as a member of the Highway 68 Improvement Corridor Team with Caltrans, TAMC, the County of Monterey, and the cities of Monterey, Del Rey Oaks and Seaside, will need to conduct further analysis to determine the improvements necessary to mitigate impacts caused by the Proposed Project Long-Term scenario.

Highway 1 and N. Fremont / Highway 1 / Highway 68 Merge Areas

Although outside the project study area for the short-term project scenarios, traffic generated by the Proposed Project Long-Term scenario is expected to impact the short weaving segments at the N. Fremont Street / Highway 1 / Highway 68 interchange. In addition, mainline segments of Highway 1 would also likely be impacted. To mitigate the project’s impacts on the mainline segments of Highway 1 and the short weaving segments at the N. Fremont Street / Highway 1/ Highway 68 interchange, the mainline would probably need to be widened to add another lane in each direction and the weaving segments would probably need to be lengthened.

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).

2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).

3 LOS highlighted in red indicates intersection operating below level of service standard.

4 * = delay greater than 300 seconds.

5 LOS in bold box indicates project impact.

8.2 Alternative 1 Project Long-Term Traffic Conditions

8.2.1 Alternative 1 Project Long-Term – Trip Generation, Distribution, and Assignment

As discussed in Section 3.2.4, the Alternative 1 Project Long-Term scenario includes a similar combination of actions and development to the Proposed Project that would reduce traffic at some locations and increase traffic at other locations within the study area. This scenario also includes high-intensity development on the north and south sides of the Airport. The only difference between this scenario and the Proposed Project Long-Term scenario is this scenario includes the relocation of the Airport Rescue and Firefighting Building from the south side of the Airport to the north side of the Airport.

This scenario would result in the same amount of net new traffic on the road network as the Proposed Project Long-Term scenario, however, with this scenario, traffic generated by the ARFF Building would be redistributed from the south side of the Airport to the north side of the Airport.

The Alternative 1 Project Long-Term scenario would result in a total net new trip generation of 10,991 daily trips, with 1,370 occurring during the AM peak hour (1,164 in, 206 out) and 1,368 occurring during the PM peak hour (265 in, 1,103 out). Details of the Alternative 1 Project Long-Term trip generation are provided in **Table 30**.

The Project trips were assigned to the study intersections using the same distribution percentages used for the Proposed Project Short-Term scenario. The increases and reductions in trips from the relocated hangars were added to the new trips generated by the new hangars and the long-term non-aviation development to obtain the Alternative 1 Project Long-Term AM and PM peak hour trip assignments, which are shown in **Figures 36** and **37**.

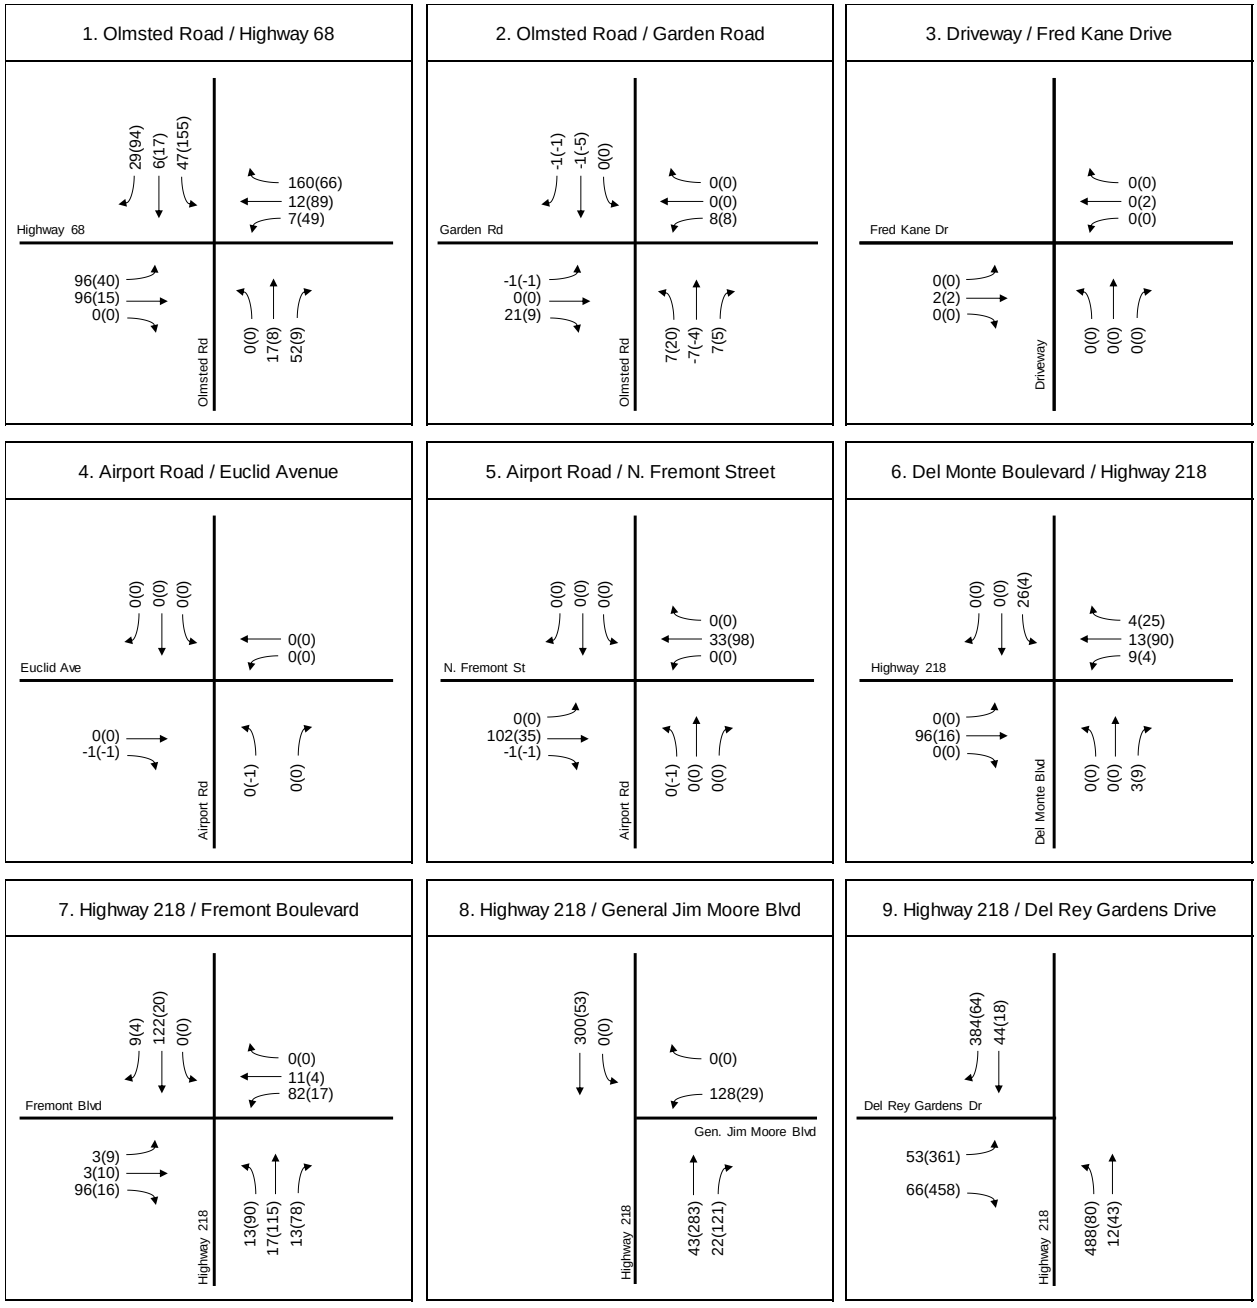
Notes:

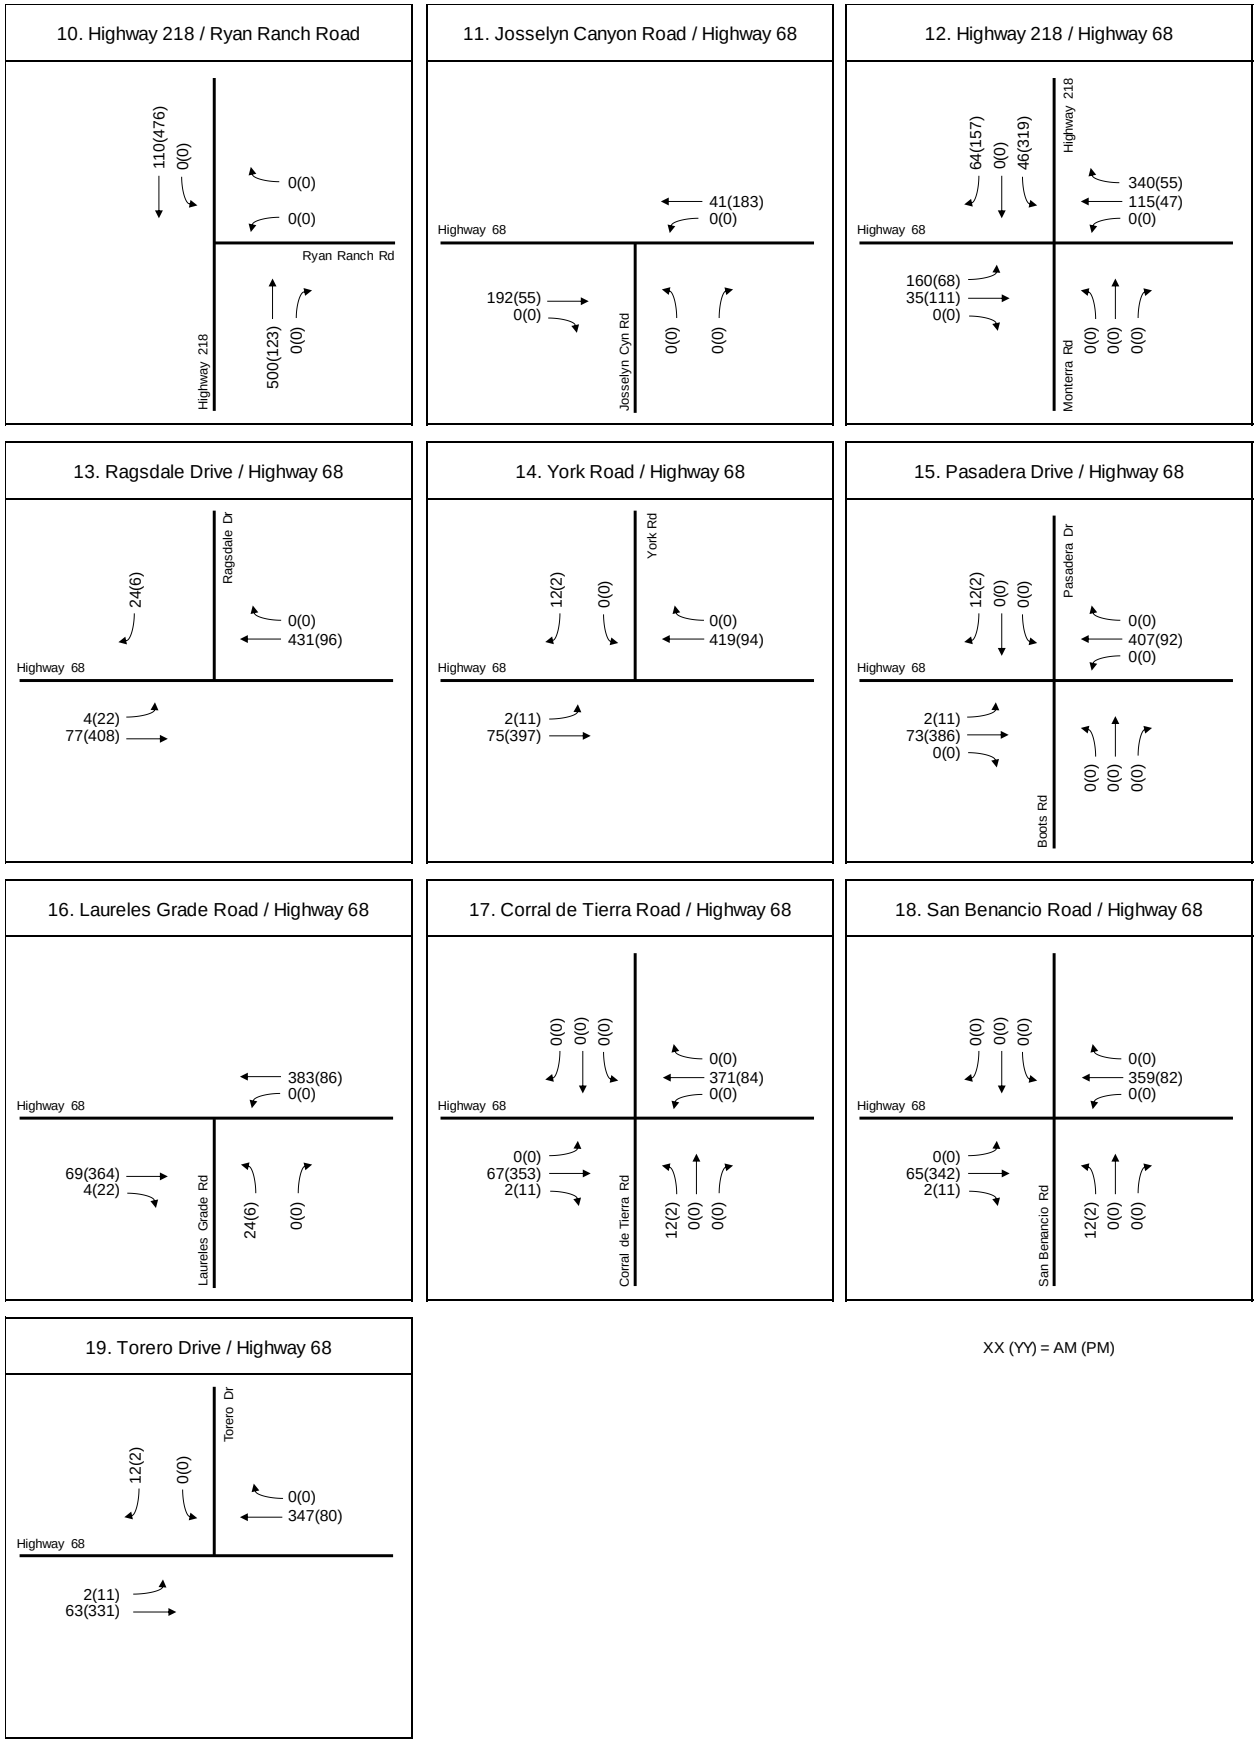
1. Trip generation rates from Institute of Transportation Engineers (ITE) *Trip Generation*, 9th Edition, 2012, where appropriate.
2. Trip generation rates for hangars based on gate counts at Monterey Regional Airport (November 1 - December 31, 2016).
3. Trips generated by ARFF building based on Monterey Fire Department staffing, schedule, and incident reports (November 1 - December 31, 2016).
4. Relocated trips in red are subtracted from their current access point and added to the north side via the North Side Road.
5. The 44 hangars relocated from the south side are included in the 51 hangars on the north side.

Figure 36: Alt. 1 Project Long-Term Trip Assignment (1 – 9)



XX (YY) = AM (PM)

Figure 37: Alt. 1 Project Long-Term Trip Assignment (10 – 19)



8.2.2 Cumulative Plus Alternative 1 Project Long-Term – Intersection Operations

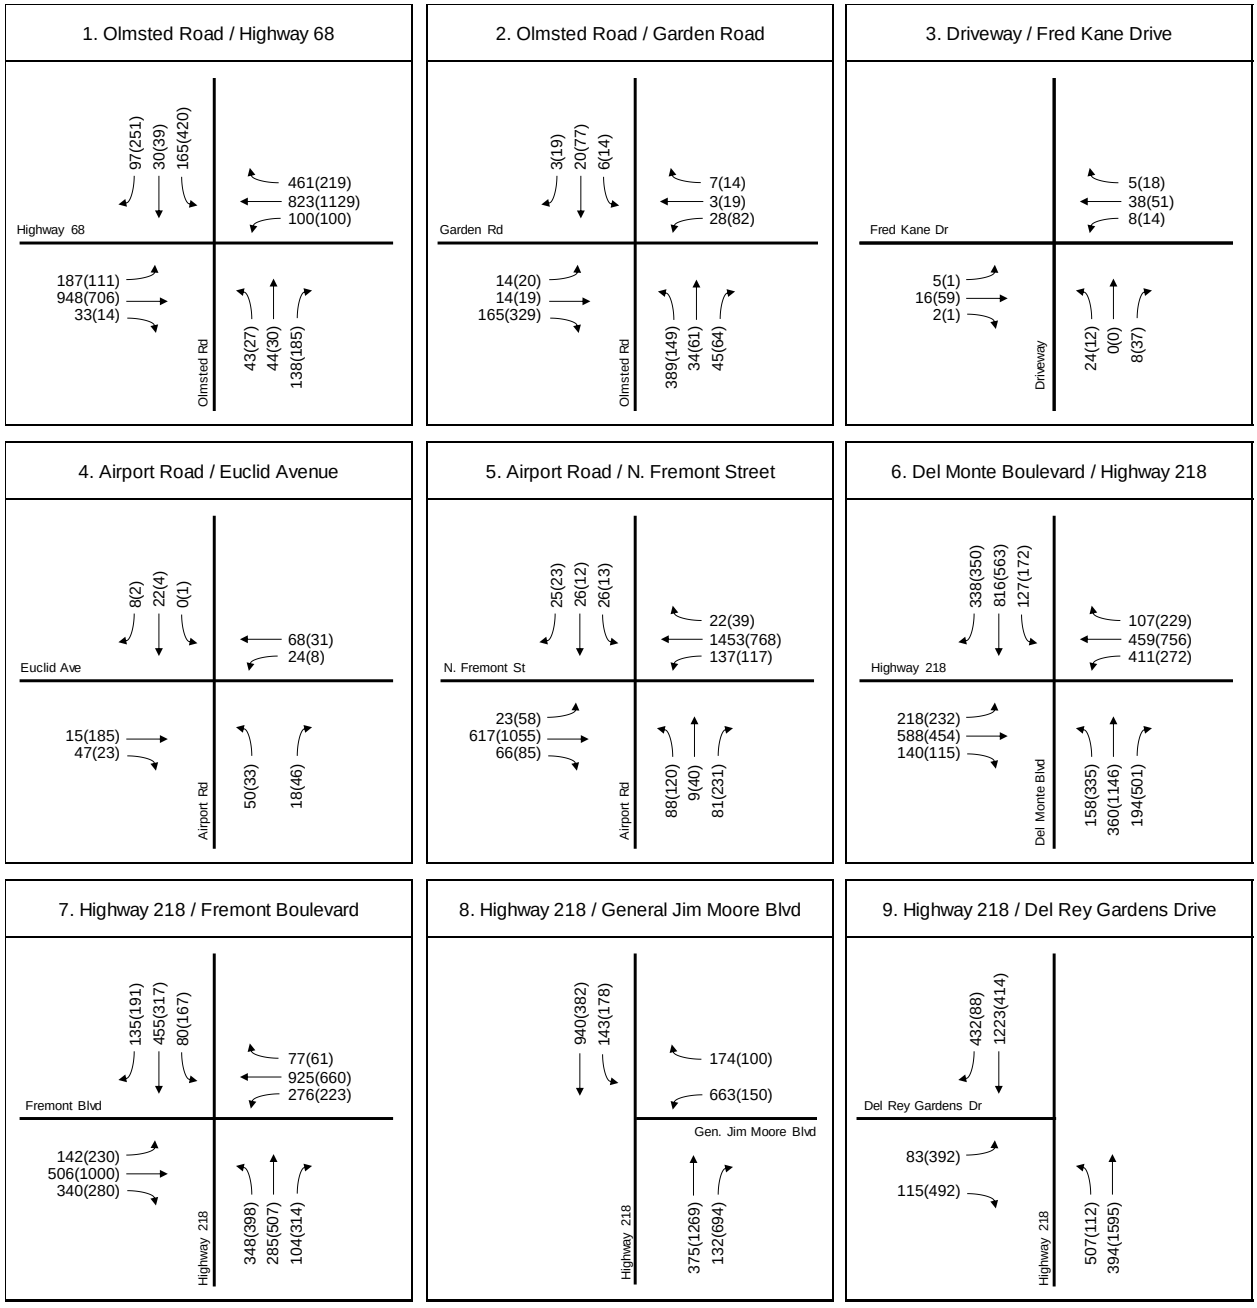
The Alternative 1 Project Long-Term trip assignments were combined with the Cumulative conditions traffic volumes to obtain Cumulative Plus Alternative 1 Project Long-Term AM and PM peak hour traffic volumes, which are shown in **Figures 38** and **39**.

Based on the City of Monterey and Caltrans level of service standards, the following study intersections would operate deficiently under Cumulative Plus Alternative 1 Project Long-Term traffic conditions (**Table 31**):

Intersection #1 – Olmsted Road / Highway 68
Intersection #6 – Del Monte Boulevard / Highway 218
Intersection #7 – Highway 218 / Fremont Boulevard
Intersection #8 – Highway 218 / General Jim Moore Boulevard
Intersection #9 – Highway 218 / Del Rey Gardens Drive
Intersection #10 – Highway 218 / Ryan Ranch Road
Intersection #11 – Josselyn Canyon Road / Highway 68
Intersection #12 – Highway 218 / Highway 68
Intersection #14 – York Road / Highway 68
Intersection #15 – Pasadera Drive / Highway 68
Intersection #16 – Laureles Grade Road / Highway 68
Intersection #17 – Corral De Tierra Road / Highway 68
Intersection #18 – San Benancio Road / Highway 68
Intersection #19 – Torero Drive / Highway 68

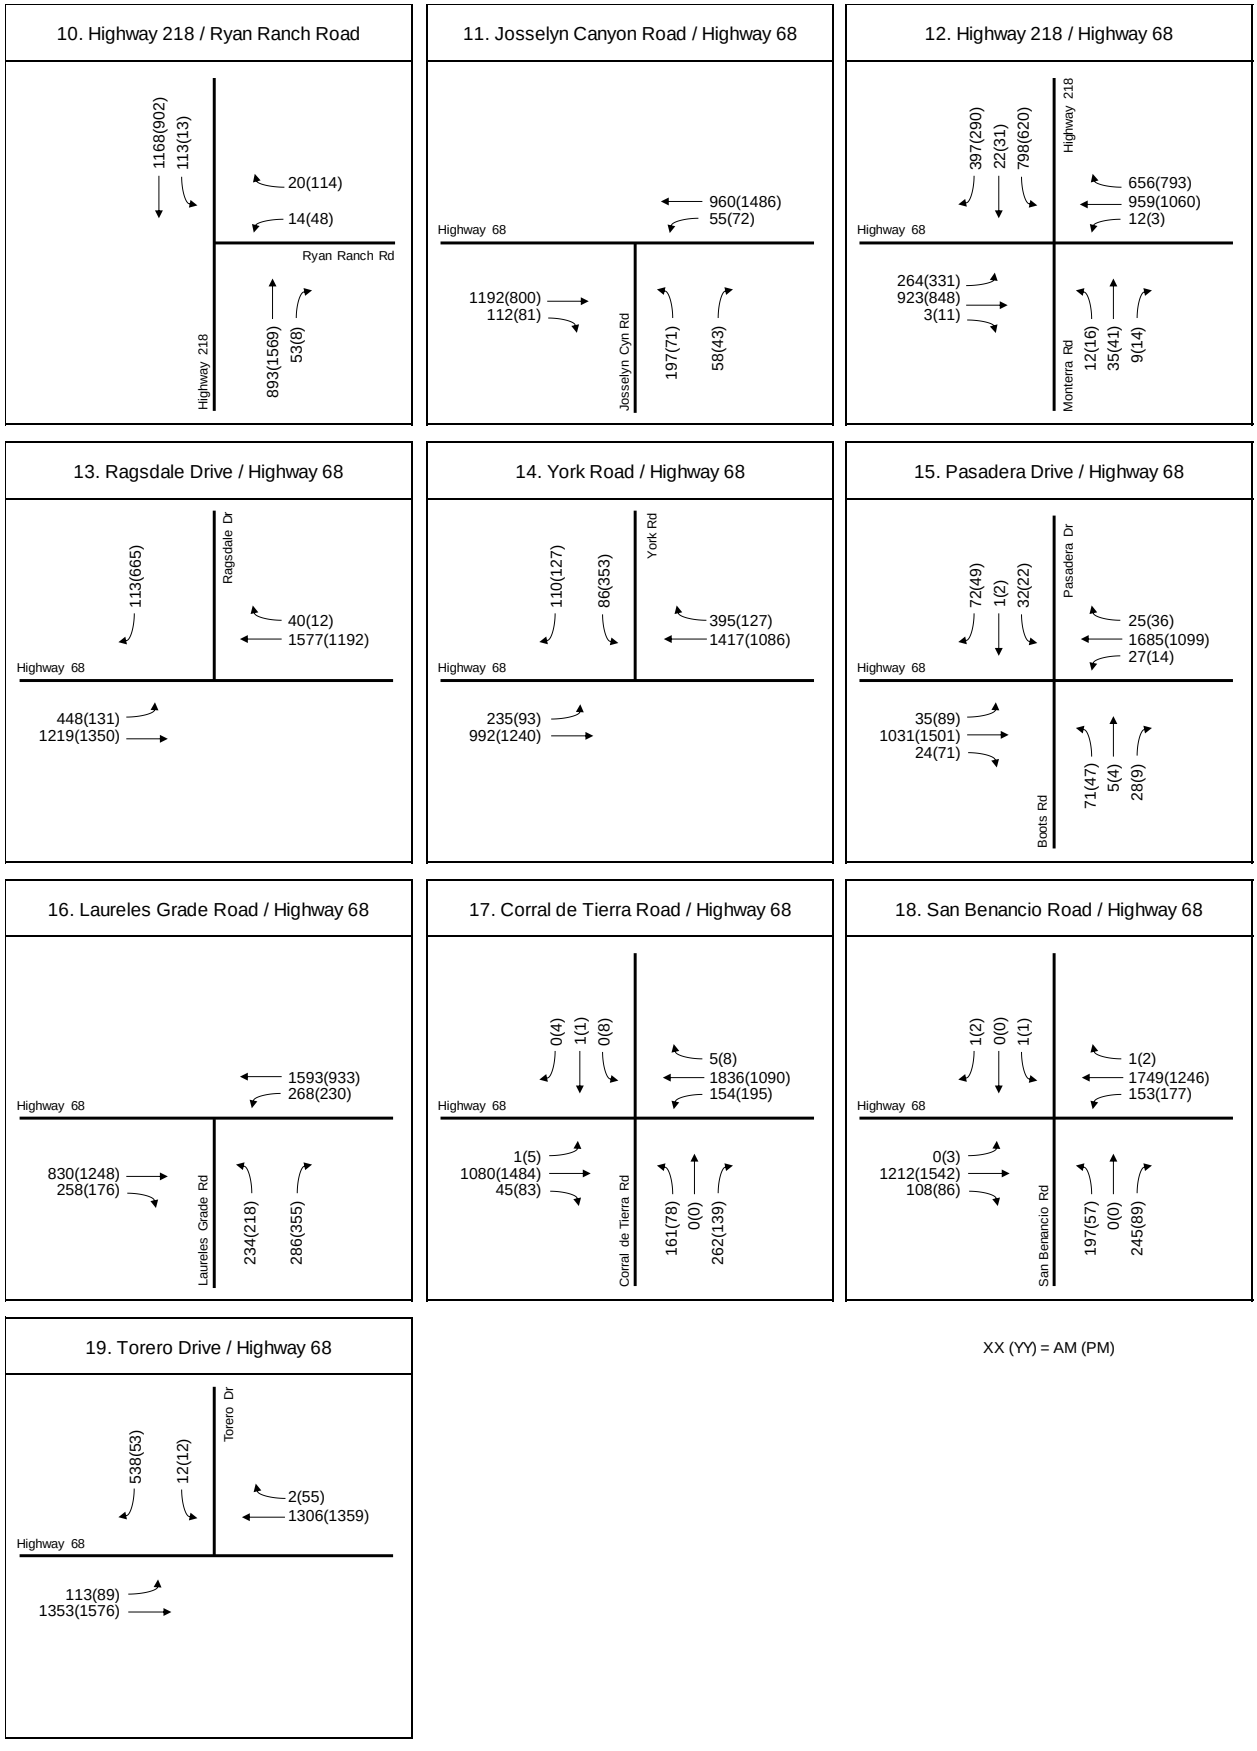
It should be noted that these intersections would also operate at deficient levels of service under Cumulative without Project conditions.

Figure 38: Cumulative Plus Alt. 1 Project Long-Term Volumes (1 – 9)



XX (YY) = AM (PM)

Figure 39: Cumulative Plus Alt. 1 Project Long-Term Volumes (10 – 19)



8.2.3 Cumulative Plus Alternative 1 Project Long-Term – Project Impacts

Based on the criteria for project impacts, the Project would have a significant cumulative impact at the following intersections under Cumulative Plus Alternative 1 Project Long-Term conditions:

Intersection #1 – Olmsted Road / Highway 68
Intersection #6 – Del Monte Boulevard / Highway 218
Intersection #7 – Highway 218 / Fremont Boulevard
Intersection #8 – Highway 218 / General Jim Moore Boulevard
Intersection #9 – Highway 218 / Del Rey Gardens Drive
Intersection #10 – Highway 218 / Ryan Ranch Road
Intersection #11 – Josselyn Canyon Road / Highway 68
Intersection #12 – Highway 218 / Highway 68
Intersection #14 – York Road / Highway 68
Intersection #15 – Pasadera Drive / Highway 68
Intersection #16 – Laureles Grade Road / Highway 68
Intersection #17 – Corral De Tierra Road / Highway 68
Intersection #18 – San Benancio Road / Highway 68
Intersection #19 – Torero Drive / Highway 68

Cumulative Plus Alternative 1 Project Long-Term intersection levels of service (LOS) are summarized in **Table 31**. LOS calculation worksheets are included in **Appendix H**. Vehicle queue estimates are included in **Appendix I**.

8.2.4 Cumulative Plus Alternative 1 Project Long-Term – Mitigation Measures

As discussed in Section 8.2.1, the Alternative 1 Project Long-Term scenario includes high-intensity development with a corresponding high trip generation estimate. It is anticipated that this level of development would require major improvements to the local and regional road network to mitigate the project's impacts.

A detailed analysis of these major improvements is beyond the scope of this study. Section 8.1.5 presents a high-level assessment of some of the major improvements that may be required to achieve acceptable LOS C traffic operations in the study area under Cumulative Plus Proposed Project and Cumulative Plus Alternative 1 Project Long-Term traffic conditions.

A: LOS Descriptions for Signalized Intersections

APPENDIX A

LEVEL OF SERVICE (LOS) DESCRIPTION
SIGNALIZED INTERSECTIONS

The capacity of an urban street is related primarily to the signal timing and the geometric characteristics of the facility as well as to the composition of traffic on the facility. Geometrics are a fixed characteristic of a facility. Thus, while traffic composition may vary somewhat over time, the capacity of a facility is generally a stable value that can be significantly improved only by initiating geometric improvements. A traffic signal essentially allocates time among conflicting traffic movements that seek to use the same space. The way in which time is allocated significantly affects the operation and the capacity of the intersection and its approaches.

The methodology for signalized intersection is designed to consider individual intersection approaches and individual lane groups within approaches. A lane group consists of one or more lanes on an intersection approach. The outputs from application of the method described in the HCM 2010 are reported on the basis of each lane. For a given lane group at a signalized intersection, three indications are displayed: green, yellow and red. The red indication may include a short period during which all indications are red, referred to as an all-red interval and the yellow indication forms the change and clearance interval between two green phases.

The methodology for analyzing the capacity and level of service must consider a wide variety of prevailing conditions, including the amount and distribution of traffic movements, traffic composition, geometric characteristics, and details of intersection signalization. The methodology addresses the capacity, LOS, and other performance measures for lane groups and the intersection approaches and the LOS for the intersection as a whole.

Capacity is evaluated in terms of the ratio of demand flow rate to capacity (v/c ratio), whereas LOS is evaluated on the basis of control delay per vehicle (in seconds per vehicle). The methodology does not take into account the potential impact of downstream congestion on intersection operation, nor does the methodology detect and adjust for the impacts of turn-pocket overflows on through traffic and intersection operation.

LEVEL OF SERVICE (LOS) CRITERIA FOR SIGNALIZED INTERSECTIONS

(Reference Highway Capacity Manual 2010)

Level of Service	Control Delay (seconds / vehicle)
A	**<10**
B	**>10 - 20**
C	**>20 - 35**
D	**>35 - 55**
E	**>55 - 80**
F	**>80**

B: LOS Descriptions for Unsignalized Intersections with Two-Way Stop Control

APPENDIX B

LEVEL OF SERVICE (LOS) DESCRIPTION
UNSIGNALIZED INTERSECTIONS WITH TWO-WAY STOP CONTROL (TWSC)

TWSC intersections are widely used and stop signs are used to control vehicle movements at such intersections. At TWSC intersections, the stop-controlled approaches are referred to as the minor street approaches; they can be either public streets or private driveways. The intersection approaches that are not controlled by stop signs are referred to as the major street approaches. A three-leg intersection is considered to be a standard type of TWSC intersection if the single minor street approach (i.e. the stem of the T configuration) is controlled by a stop sign. Three-leg intersections where two of the three approaches are controlled by stop signs are a special form of unsignalized intersection control.

At TWSC intersections, drivers on the controlled approaches are required to select gaps in the major street flow through which to execute crossing or turning maneuvers on the basis of judgement. In the presence of a queue, each driver on the controlled approach must use some time to move into the front-of-queue position and prepare to evaluate gaps in the major street flow. Capacity analysis at TWSC intersections depends on a clear description and understanding of the interaction of drivers on the minor or stop-controlled approach with drivers on the major street. Both gap acceptance and empirical models have been developed to describe this interaction.

Thus, the capacity of the controlled legs is based on three factors:
- the distribution of gaps in the major street traffic stream,;
- driver judgement in selecting gaps through which to execute the desired maneuvers; and
- the follow-up time required by each driver in a queue.

The delay experienced by a motorist is made up of a number of factors that relate to control, geometrics, traffic and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions, in the absence of incident, control, traffic or geometric delay. Average control delay for any particular minor movement is a function of the capacity of the approach and the degree of saturation and referred to as level of service.

LEVEL OF SERVICE (LOS) CRITERIA FOR TWSC INTERSECTIONS
(Reference Highway Capacity Manual 2010)

Level of Service	Control Delay (seconds / vehicle)
A	**0 - 10**
B	**>10 - 15**
C	**>15 - 25**
D	**>25 - 35**
E	**>35 - 50**
F	**>50**

C: LOS Descriptions for Unsignalized Intersections with All-Way Stop Control

APPENDIX C

LEVEL OF SERVICE (LOS) DESCRIPTION
UNSIGNALIZED INTERSECTIONS WITH ALL-WAY STOP CONTROL (AWSC)

AWSC intersections require every vehicle to stop at the intersection before proceeding. Since each driver must stop, the judgement as to whether to proceed into the intersection is a function of traffic conditions on the other approaches. While giving priority to the driver on the right is a recognized rule in some areas, it is not a good descriptor of actual intersection operations. What happens is the development of a consensus of right-of-way that alternates between the drivers on the intersection approaches, a consensus that depends primarily on the intersection geometry and the arrival patterns at the stop line.

If no traffic is present on the other approaches, a driver can proceed immediately after the stop is made. If there is traffic on one or more of the other approaches, a driver proceeds only after determining that there are no vehicles currently in the intersection and that it is the driver's turn to proceed. Since no traffic signal controls the stream movement or allocates the right-of-way to each conflicting stream, the rate of departure is controlled by the interaction between the traffic streams themselves.

For AWSC intersections, the average control delay (in seconds per vehicle) is used as the primary measure of performance. Control delay is the increased time of travel for a vehicle approaching and passing through an AWSC intersection, compared with a free-flow vehicle if it were not required to slow down or stop at the intersection.

The criteria for AWSC intersections have different threshold values than do those for signalized intersections, primarily because drivers expect different levels of performance from different kinds of traffic control devices (i.e traffic signals, two way stop or all way stop, etc.). The expectation is that a signalized intersection is designed to carry higher traffic volumes than an AWSC intersection and a higher level of control delay is acceptable at a signalized intersection for the same LOS.

For AWSC analysis using the HCM 2010 method, the LOS shown reflects the weighted average of the delay on each of the approaches. If the volume-to-capacity (v/c) ratio at the intersection is larger than 1.0, the intersection operates at LOS F, regardless of the actual control delay.

LEVEL OF SERVICE (LOS) CRITERIA FOR AWSC INTERSECTIONS
(Reference Highway Capacity Manual 2010)

Level of Service	Control Delay (seconds / vehicle)
A	**0 - 10**
B	**>10 - 15**
C	**>15 - 25**
D	**>25 - 35**
E	**>35 - 50**
F	**>50; v/c > 1.0**

D: LOS Descriptions for Roundabouts

APPENDIX D

LEVEL OF SERVICE (LOS) DESCRIPTION
ROUNDABOUT INTERSECTIONS

Roundabout intersections (or roundabouts, for short) are an alternative traffic control that are becoming more and more common in the United States. Similar to all-way stop controlled intersections, vehicles at roundabouts take turns entering the roundabout when conflicting traffic is present. However, unlike all-way stop intersections, vehicles at roundabouts are only required to yield to other conflicting vehicles, bicyclists and pedestrians; if no conflicting traffic is present, vehicles can freely proceed into and through the roundabout. This makes roundabouts generally more efficient than all-way stop or signalized intersections. Since no traffic signal controls the stream movement or allocates the right-of-way to each conflicting stream, the rate of departure is controlled by the interaction between the traffic streams themselves.

The capacity of roundabout approaches are directly influenced by flow patterns, i.e., the approach entering flow, the circulating flow inside the roundabout, and the exiting flow out of the roundabout. Pedestrian and bicyclist traffic crossing the roundabout approaches and exits can also have a lesser impact on the capacity.

For roundabout intersections, the average control delay (in seconds per vehicle) is used as the primary measure of performance. Control delay is the increased time of travel for a vehicle approaching and passing through a roundabout, compared with a free-flow vehicle if it were not required to slow down or yield at the intersection.

The level of service criteria for roundabout intersections is the same as for all-way stop controlled intersections, which reflects their similar operating characteristics.

For roundabout analysis using the HCM 2010 method, the LOS shown reflects the weighted average of the delay on each of the approaches. If the volume-to-capacity (v/c) ratio at the roundabout is larger than 1.0, the roundabout operates at LOS F, regardless of the actual control delay.

LEVEL OF SERVICE (LOS) CRITERIA FOR ROUNDABOUT INTERSECTIONS

(Reference 2010 Highway Capacity Manual)

Level of Service	Control Delay (seconds / vehicle)
A	**0 - 10**
B	**>10 - 15**
C	**>15 - 25**
D	**>25 - 35**
E	**>35 - 50**
F	**>50; v/c >1.0**

E: LOS Descriptions for Two-Lane and Multi-Lane Highways

Appendix E

2010 Highway Capacity Manual
LOS Descriptions for Two-Lane Highway and Multi-Lane Highway Road Segments

Automobile LOS is defined by density.

Automobile Mode

Automobile LOS for multilane highway segments are defined in Exhibit 14-4. Because speeds are constant through a broad range of flow rates, LOS are defined on the basis of density, which is a measure of the proximity of vehicles to each other in the traffic stream.

Exhibit 14-4
Automobile LOS for Multilane Highway Segments

LOS	FFS (mi/h)	Density (pc/mi/ln)

F	Demand Exceeds Capacity	
	60	>40
	55	>41
	50	>43
	45	>45

On Class I two-lane highways, speed and delay due to passing restrictions are both important to motorists. Therefore, on these highways, LOS is defined in terms of both ATS and PTSF. On Class II highways, travel speed is not a significant issue to drivers. Therefore, on these highways, LOS is defined in terms of PTSF only. On Class III highways, high speeds are not expected. Because the length of Class III segments is generally limited, passing restrictions are also not a major concern. In these cases, drivers would like to make steady progress at or near the speed limit. Therefore, on these highways, PFFS is used to define LOS. The LOS criteria for two-lane highways are shown in Exhibit 15-3.

Exhibit 15-3
Automobile LOS for Two-Lane Highways

LOS	Class I Highways		Class II Highways	Class III Highways
	ATS (mi/h)	PTSF (%)	PTSF (%)	PFFS (%)
A	>55	≤35	≤40	>91.7
B	>50–55	>35–50	>40–55	>83.3–91.7
C	>45–50	>50–65	>55–70	>75.0–83.3
D	>40–45	>65–80	>70–85	>66.7–75.0
E	≤40	>80	>85	≤66.7

Roundabout

All Movement Classes

	South	East	North	West	Intersection
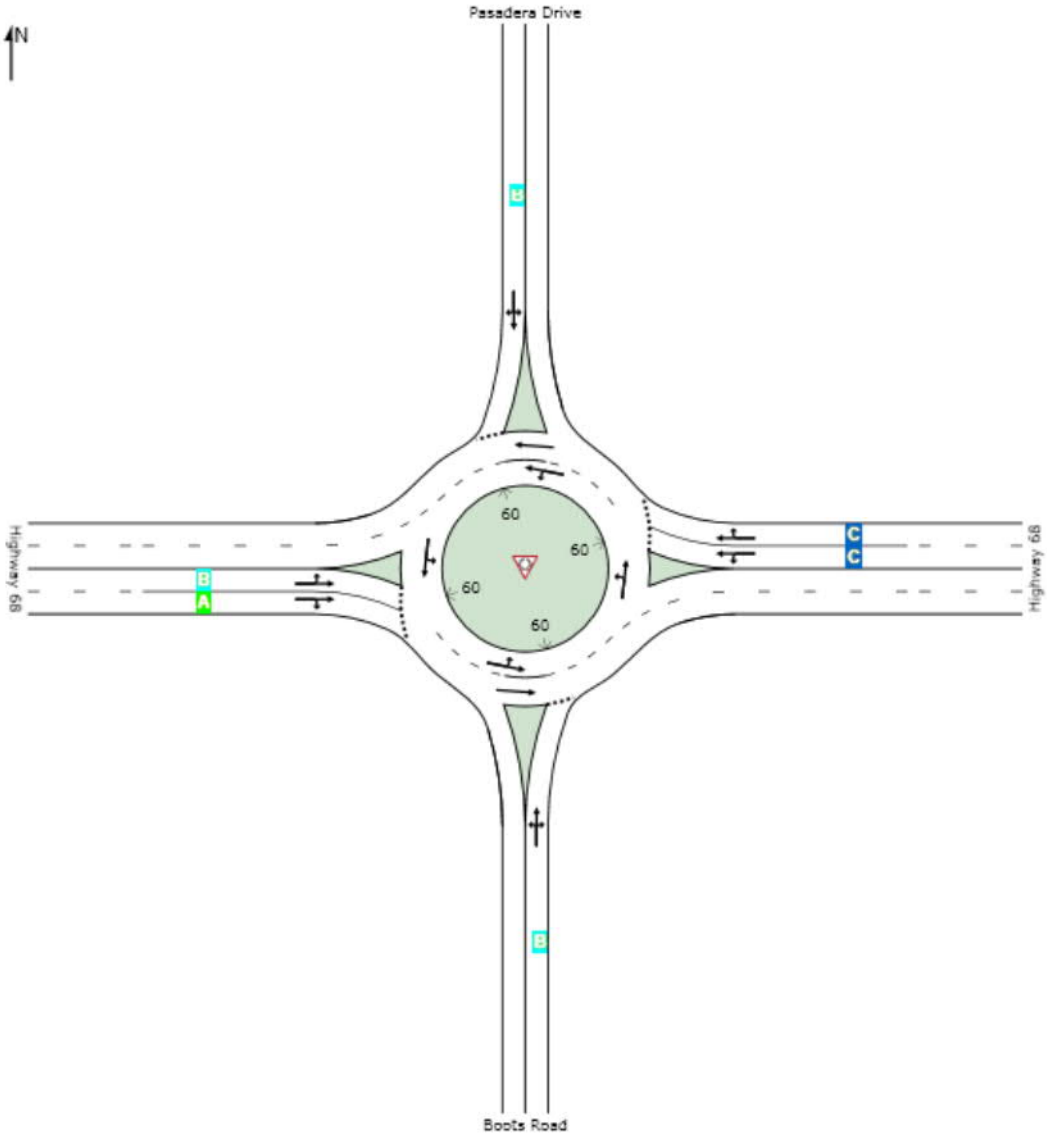
LOS	B	C	B	B	B



Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

All Vehicles		2896	3.0	0.849	17.9	LOS C	5.8	147.8	0.57	0.51	28.3

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

All Vehicles		3449	3.0	0.904	17.7	LOS C	11.6	296.2	0.63	0.67	28.1

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

All Vehicles		2447	3.0	0.718	12.6	LOS B	6.6	168.2	0.41	0.24	30.4

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

2	T1	910	3.0	0.574	11.2	LOS B	3.8	97.0	0.39	0.23	30.9
Approach		1146	3.0	0.574	11.2	LOS B	3.8	97.0	0.39	0.23	30.8
All Vehicles		2780	3.0	0.836	18.8	LOS C	11.0	281.8	0.67	0.61	27.9

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Sign Control.
Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: US HCM 2010.
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
Gap-Acceptance Capacity: Traditional M1.
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Notes:

1 Queue lengths shown in feet.

2 # = 95th percentile volume exceeds capacity, queue may be longer. Queue shown in maximum after two cycles.

3 m = Volume for 95th percentile queue is metered by upstream signal.

4 Mitigated queue lengths with proposed roundabout improvements (i.e., designated with PI#) indicate the estimated 95% percentile queue by approach (in feet).

Notes:

1 Queue lengths shown in feet.

2 # = 95th percentile volume exceeds capacity, queue may be longer. Queue shown in maximum after two cycles.

3 m = Volume for 95th percentile queue is metered by upstream signal.

4 Mitigated queue lengths with proposed roundabout improvements (i.e., designated with PI#) indicate the estimated 95% percentile queue by approach (in feet).

Notes:

1 Queue lengths shown in feet.

2 # = 95th percentile volume exceeds capacity, queue may be longer. Queue shown in maximum after two cycles.

3 m = Volume for 95th percentile queue is metered by upstream signal.

4 Mitigated queue lengths with proposed roundabout improvements (i.e., designated with PI#) indicate the estimated 95% percentile queue by approach (in feet).

Passing Lane Analysis

Total length of analysis segment, Lt	0.0	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSd (from above)	32.5	mi/h
Percent time-spent-following, PTSFd (from above)	89.9	
Level of service, LOSd (from above)	E	

Average Travel Speed with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi
Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

Percent Time-Spent-Following with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

Level of Service and Other Performance Measures with Passing Lane

Level of service including passing lane, LOSpl	A	
Peak 15-min total travel time, TT15	-	veh-h

Bicycle Level of Service

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	1143.0
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	2.93
Bicycle LOS	C

Notes:
1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific dewngrade segments are treated as level terrain.
2. If vi (vd or vo) >= 1,700 pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Grade adjustment factor,(note-1) fg	1.00	1.00
Directional flow rate,(note-2) vi	1229 pc/h	1216 pc/h
Base percent time-spent-following,(note-4) BPTSFd	85.2 %	
Adjustment for no-passing zones, fnp	12.5	
Percent time-spent-following, PTSFd	91.5 %	

Level of Service and Other Performance Measures

Level of service, LOS	E	
Volume to capacity ratio, v/c	0.72	
Peak 15-min vehicle-miles of travel, VMT15	0	veh-mi
Peak-hour vehicle-miles of travel, VMT60	0	veh-mi
Peak 15-min total travel time, TT15	0.0	veh-h
Capacity from ATS, CdATS	0	veh/h
Capacity from PTSF, CdPTSF	1700	veh/h
Directional Capacity	1700	veh/h

Passing Lane Analysis

Total length of analysis segment, Lt	0.0	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSd (from above)	35.0	mi/h
Percent time-spent-following, PTSFd (from above)	91.5	
Level of service, LOSd (from above)	E	

Average Travel Speed with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi
Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

Percent Time-Spent-Following with Passing Lane

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

Level of Service and Other Performance Measures with Passing Lane

Level of service including passing lane, LOSpl	A	
Peak 15-min total travel time, TT15	-	veh-h

Bicycle Level of Service

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	1229.2
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	2.97
Bicycle LOS	C

Notes:
1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific dewngrade segments are treated as level terrain.
2. If vi (vd or vo) >= 1,700 pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

K: TAMC Bicycle and Pedestrian Master Plan Map

Appendix K
Monterey County Bike Map

LEGEND / Leyenda

Separated Bike Path
Closed to cars and motorcycles
Camino separados para bicicletas
Cerrado a los carros y motocicletas

Bike Lane
Separate lane on roadway
Carril de Bicicleta
Carril separado en la calle

Bike Route
Cyclists share roadway on lower traffic street
Ruta de Bicicleta
Ciclistas comparten la calle en áreas con menos tráfico

Unofficial Bike Routes
Roads with narrow lane widths and/or higher speed traffic, use caution
Rutas de bicicleta no oficiales
Calles con carriles angostos y/o mayor tráfico de alta velocidad , sea precavido

Cross County Bike Routes
High speed roadway, bikes allowed on highways
Rutas de Bicicleta Cruza Condados
Carreteras de alta velocidad, bicis permitidas en autopistasv

Regional Bike Routes
Paths, lanes and routes connecting cities
Rutas de Bicicleta Regionales
Caminos, carriles y rutas que conectan ciudades

Unpaved Trails
Separate, dirt paths
Caminos Sin Pavimentar
Caminos de tierra separados

Uphill Bikeway
Indicates climb
Pendiente pronunciada
Indica cuesta

Parks
Parques

Bodies of Water
Cuerpos de Agua
