NOTICE OF PREPARATION/ INITIAL STUDY AND PUBLIC COMMENTS

NOTICE OF PREPARATION AND NOTICE OF SCOPING MEETING

DATE: December 28, 2015
SUBJECT: Notice of Preparation of an Environmental Impact Report and Notice of Scoping Meeting
PROJECT TITLE: Monterey Regional Airport – Airport Master Plan
APPLICANT: Monterey Peninsula Airport District
200 Fred Kane Drive
Monterey, California 93940

Notice is hereby given pursuant to Section 15082 of the State California Environmental Quality Act ("CEQA") Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq.), that the Monterey Peninsula Airport District ("District"), acting in its capacity as the owner and operator of Monterey Regional Airport, has determined that an Environmental Impact Report ("EIR") is the appropriate environmental document for the Monterey Regional Airport Master Plan Project ("Project"). The District will be the Lead Agency for the Project and will be responsible for the EIR preparation pursuant to CEQA and the State CEQA Guidelines. The Project description, location, and an analysis of the probable environmental effects of the proposed project are contained in the attached materials.

As required by Section 15082 of the CEQA Guidelines, this Notice of Preparation ("NOP") has been prepared and distributed to solicit comments from potential Responsible and Trustee Agencies on Project-related concerns relevant to each agency's statutory responsibilities. Comments on the content and scope of the EIR also are solicited from any other interested parties (including other agencies and affected members of the public). The EIR will be the environmental document of reference for Responsible and Trustee Agencies when considering subsequent discretionary approvals.

The District requests that any potential Responsible or Trustee Agencies responding to this NOP reply in a manner consistent with Section 15082(b) of the State CEQA Guidelines, which allows for the submittal of any comments in response to this notice no later than 45 days after receipt of the NOP. The District will accept comments from these Agencies and others regarding this NOP through the close of business, February 16, 2016.

This NOP is available for viewing at www.montereyairport.com. In addition, a Scoping Meeting will be held from 2:00PM-4:00PM at the following location: 2nd Floor of the Airport Terminal Building 200 Fred Kane Drive, Suite 200, Monterey, CA 93940 on Wednesday, February 3, 2016.

Your agency and other interested parties are invited to attend and submit comments for consideration during preparation of the EIR. All comments and responses to this NOP must be submitted in writing to:

PROOF OF PUBLICATION

STATE OF CALIFORNIA
County of Monterey

I am a citizen of the United States and a resident of the County aforesaid. I am over the age of eighteen years, and not a party to or interested in the above-entitled matter. I am the principal clerk of the printer of The Monterey Herald, a newspaper of general circulation, printed and published daily and Sunday in the City of Monterey, County of Monterey, and which newspaper has been adjudged a newspaper of general circulation by the Superior Court of the County of Monterey, State of California; that the notice, of which the annexed is a printed copy (set in type not smaller than 6 point), has been published in each regular and entire issue of said newspaper and not in any supplement thereof on the following dates, to wit:

12/30/15

I certify (or declare) under penalty of perjury that the foregoing is true and correct.

Executed on 12/30/2015 at Monterey, California.

Legal Notices

Notice of Preparation of an Environmental Impact Report and Notice of Scoping Meeting
Comments due: February 16, 2016

Notice is hereby given pursuant to Section 15082 of the State California Environmental Quality Act ("CEQA") Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq.), that the Monterey Peninsula Airport District ("District"), acting in its capacity as the owner and operator of Monterey Regional Airport, has determined that an Environmental Impact Report ("EIR") is the appropriate environmental document for the Monterey Regional Airport Master Plan Project ("Project"). The District will be the Lead Agency for the Project and will be responsible for the EIR preparation pursuant to CEQA and the State CEQA Guidelines. The Project description, location, and an analysis of the probable environmental effects of the proposed project are available for the public to view at the District's Planning and Development Department.

As required by Section 15082 of the CEQA Guidelines, this Notice of Preparation ("NOP") has been prepared and distributed to solicit comments from potential Responsible and Trustee Agencies on Project-related concerns relevant to each agency's statutory responsibilities. Comments on the content and scope of the EIR also are solicited from any other interested parties (including other agencies and affected members of the public). The EIR will be the environmental document of reference for Responsible and Trustee Agencies when considering subsequent discretionary approvals.

The District requests that any potential Responsible or Trustee Agencies responding to this NOP reply in a manner consistent with Section 15082(b) of the State CEQA Guidelines, which allows for the submittal of any comments in response to this notice no later than 45 days after receipt of the NOP. The District will accept comments from these Agencies and others regarding this NOP through the close of business, February 16, 2016.

This NOP is available for viewing at www.montereyairport.com. In addition, a Scoping Meeting will be held from 2:00PM-4:00PM at the following location: 2nd Floor of the Airport Terminal Building 200 Fred Kane Drive, Suite 200, Monterey, CA 93940 on Wednesday, February 3, 2016.

Agencies and other interested parties are invited to attend and submit comments for consideration during preparation of the EIR. All comments and responses to this NOP must be submitted in writing to: Shelley Glennon, Planning Manager – Environmental, 200 Fred Kane Drive, Suite 200 Monterey, CA 93940, phone: (831) 648-7000 Ext. 209 or via email: sglennon@montereyairport.com.

To: Reviewing Agencies

Re: Monterey Regional Master Plan
SCH# 2015121105

Attached for your review and comment is the Notice of Preparation (NOP) for the Monterey Regional Master Plan draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Mark Bautista
Monterey Peninsula Airport District
200 Fred Kane Drive, Suite 200
Monterey, CA 93940

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

SCH# 2015121105
Project Title Monterey Regional Master Plan
Lead Agency Monterey Peninsula Airport District

Type NOP Notice of Preparation

Description The proposed AMP is a facility-level planning study that sets forth a conceptual framework for possible future airport development within the AMP's 20-year planning horizon (2013-2033). Due to the process involved in evaluating the AMP under CEQA and obtaining funding for improvements proposed by the project, the actual first year of implementation is likely to be 2017. For purposes of CEQA, the baseline year for identifying the existing environmental conditions is 2015.

INTRODUCTION

This Initial Study evaluates the potential environmental effects of the proposed Airport Master Plan (AMP) for Monterey Regional Airport (Airport or MRY). The goals of the AMP are to address Federal Aviation Administration (FAA) airport design standards and satisfy projected aviation demand, while considering cost-effectiveness and potential safety, environmental, and socioeconomic issues. The AMP process is guided by the FAA in Advisory Circular (AC) 150/5070-6B, Change 2, *Airport Master Plans* (FAA 2015).

Some of the main components of the proposed AMP include:

- Recommending improvements that will enhance the Airport's safety capabilities to the maximum extent feasible;
- Projecting aeronautical facility needs through the year 2033;
- Establishing a schedule of development priorities and a program for the improvements proposed in the AMP, including a detailed financial plan; and
- Developing goals, objectives, and performance targets for a sustainability plan for the Airport.

This Initial Study has been prepared pursuant to the *California Environmental Quality Act* (CEQA; Public Resources Code, Section 21000 et seq.) for the Monterey Peninsula Airport District (MPAD)[1] because the proposed AMP is a "project" subject to CEQA (Cal. Code Regs., Title 14, Section 15378 [CEQA Guidelines]). MPAD is the "Lead Agency" for this project (CEQA Guidelines, Section 15367), and will determine the appropriate level of CEQA documentation required for the proposed AMP based on the information presented in this Initial Study.

ENVIRONMENTAL REVIEW PROCESS

This Initial Study contains an "Environmental Checklist" that assesses potential environmental impacts of the proposed AMP using the form included in Appendix G of the CEQA Guidelines. A brief explanation is provided for all responses contained in the Environmental Checklist, including supportive documentation for those responses identified as "No Impact" or "Less than Significant Impact."

Based on the research and analysis undertaken to complete the Environmental Checklist, implementation of the proposed AMP has the potential to result in significant environmental impacts; therefore, alternatives to the proposed project, as well as mitigation, must be further evaluated. Based on this determination, MPAD is proposing to prepare an Environmental Impact Report (EIR) for the proposed project. This Initial Study will be used to identify those impact categories that require further study within the EIR, as well as to inform and solicit input from the public and other agencies as to the scope and content of the recommended EIR.

A list of references and definitions of acronyms used in this document are presented at the end of this report.

[1] MPAD is a Special Airport District that was created by the California Legislature in 1941. It is a stand-alone public entity, governed by five publicly elected members to the Board of Directors. District voting boundaries were set by the enabling legislation and encompass the cities of Monterey, Pacific Grove, Carmel by the Sea, Seaside, Del Rey Oaks, and Sand City and unincorporated communities within the County of Monterey, including Pebble Beach, the west end of Carmel Valley, Hidden Hills, Laguna Seca and Monterey-Salinas Highway to the Laureles Grade.

PROJECT DESCRIPTION

1. Project Title:

Proposed Airport Master Plan (AMP) for Monterey Regional Airport

2. Lead Agency Name and Address:

Monterey Peninsula Airport District (MPAD)
200 Fred Kane Drive, Suite 200
Monterey, CA 93940

3. Project Location:

The Airport is centrally located between the cities in and around the Monterey Peninsula, in the northwest portion of Monterey County, California (**Exhibit 1**). The Airport encompasses approximately 498 acres of property and is bordered by the City of Monterey on the northwest, west, south and east, and the City of Del Rey Oaks to the northeast. The United States (U.S.) Navy also owns several parcels in the vicinity of the Airport, including most of the golf course located immediately to the west. Monterey Bay is slightly more than one mile to the west of the Airport. The Airport is not located within the California Coastal Zone.[2]

[2] City of Monterey Coastal Zone Boundary, http://monterey.org/Portals/1/peec/maps/coastalZone_11x17.pdf, accessed November 2015.

4. Project Sponsor's Name, Address, and Contact:

Monterey Peninsula Airport District
200 Fred Kane Drive, Suite 200
Monterey, CA 93940

Attn. Ms. Shelley Glennon, Planning Manager - Environmental
(831) 648-7000 Ext. 209

5. Description of Project:

The proposed AMP is a facility-level planning study that sets forth a conceptual framework for possible future airport development within the AMP's 20-year planning horizon (2013-2033). Due to the process involved in evaluating the AMP under CEQA and obtaining funding for improvements proposed by the project, the actual first year of implementation is likely to be 2017. For purposes of CEQA, the baseline year for identifying the existing environmental conditions is 2015.

The goal of the AMP is to satisfy projected aviation demand, while considering cost-effectiveness and potential safety, environmental, and socioeconomic issues. The AMP process is guided by the FAA in AC 150/5070-6B, Change 2, *Airport Master Plans* (FAA 2015). As part of the preliminary steps within the AMP process, the FAA reviewed and approved the proposed AMP's aviation forecasts (i.e., the projected growth of airport services) on September 24, 2014. The FAA will also be asked to conditionally approve the Airport Layout Plan (ALP) for airspace and design standards. Any FAA approval of an ALP indicates that existing facilities and proposed development depicted on the ALP conform to the FAA's airport design standards and that the FAA finds the proposed development to be safe and efficient. However, one precondition to the implementation of improvements depicted on a conditionally approved ALP is that compliance with the *National Environmental Policy Act* (NEPA) must be undertaken prior to the FAA's issuance of improvement-specific approvals.

Some of the main components of the proposed AMP include:

- Recommending improvements that will enhance the Airport's safety capabilities to the maximum extent feasible;

- Projecting aeronautical facility needs through the year 2033;

- Establishing a schedule of development priorities and a program for the improvements proposed in the AMP, including a detailed financial plan; and

- Developing goals, objectives, and performance targets for a sustainability plan for the Airport.

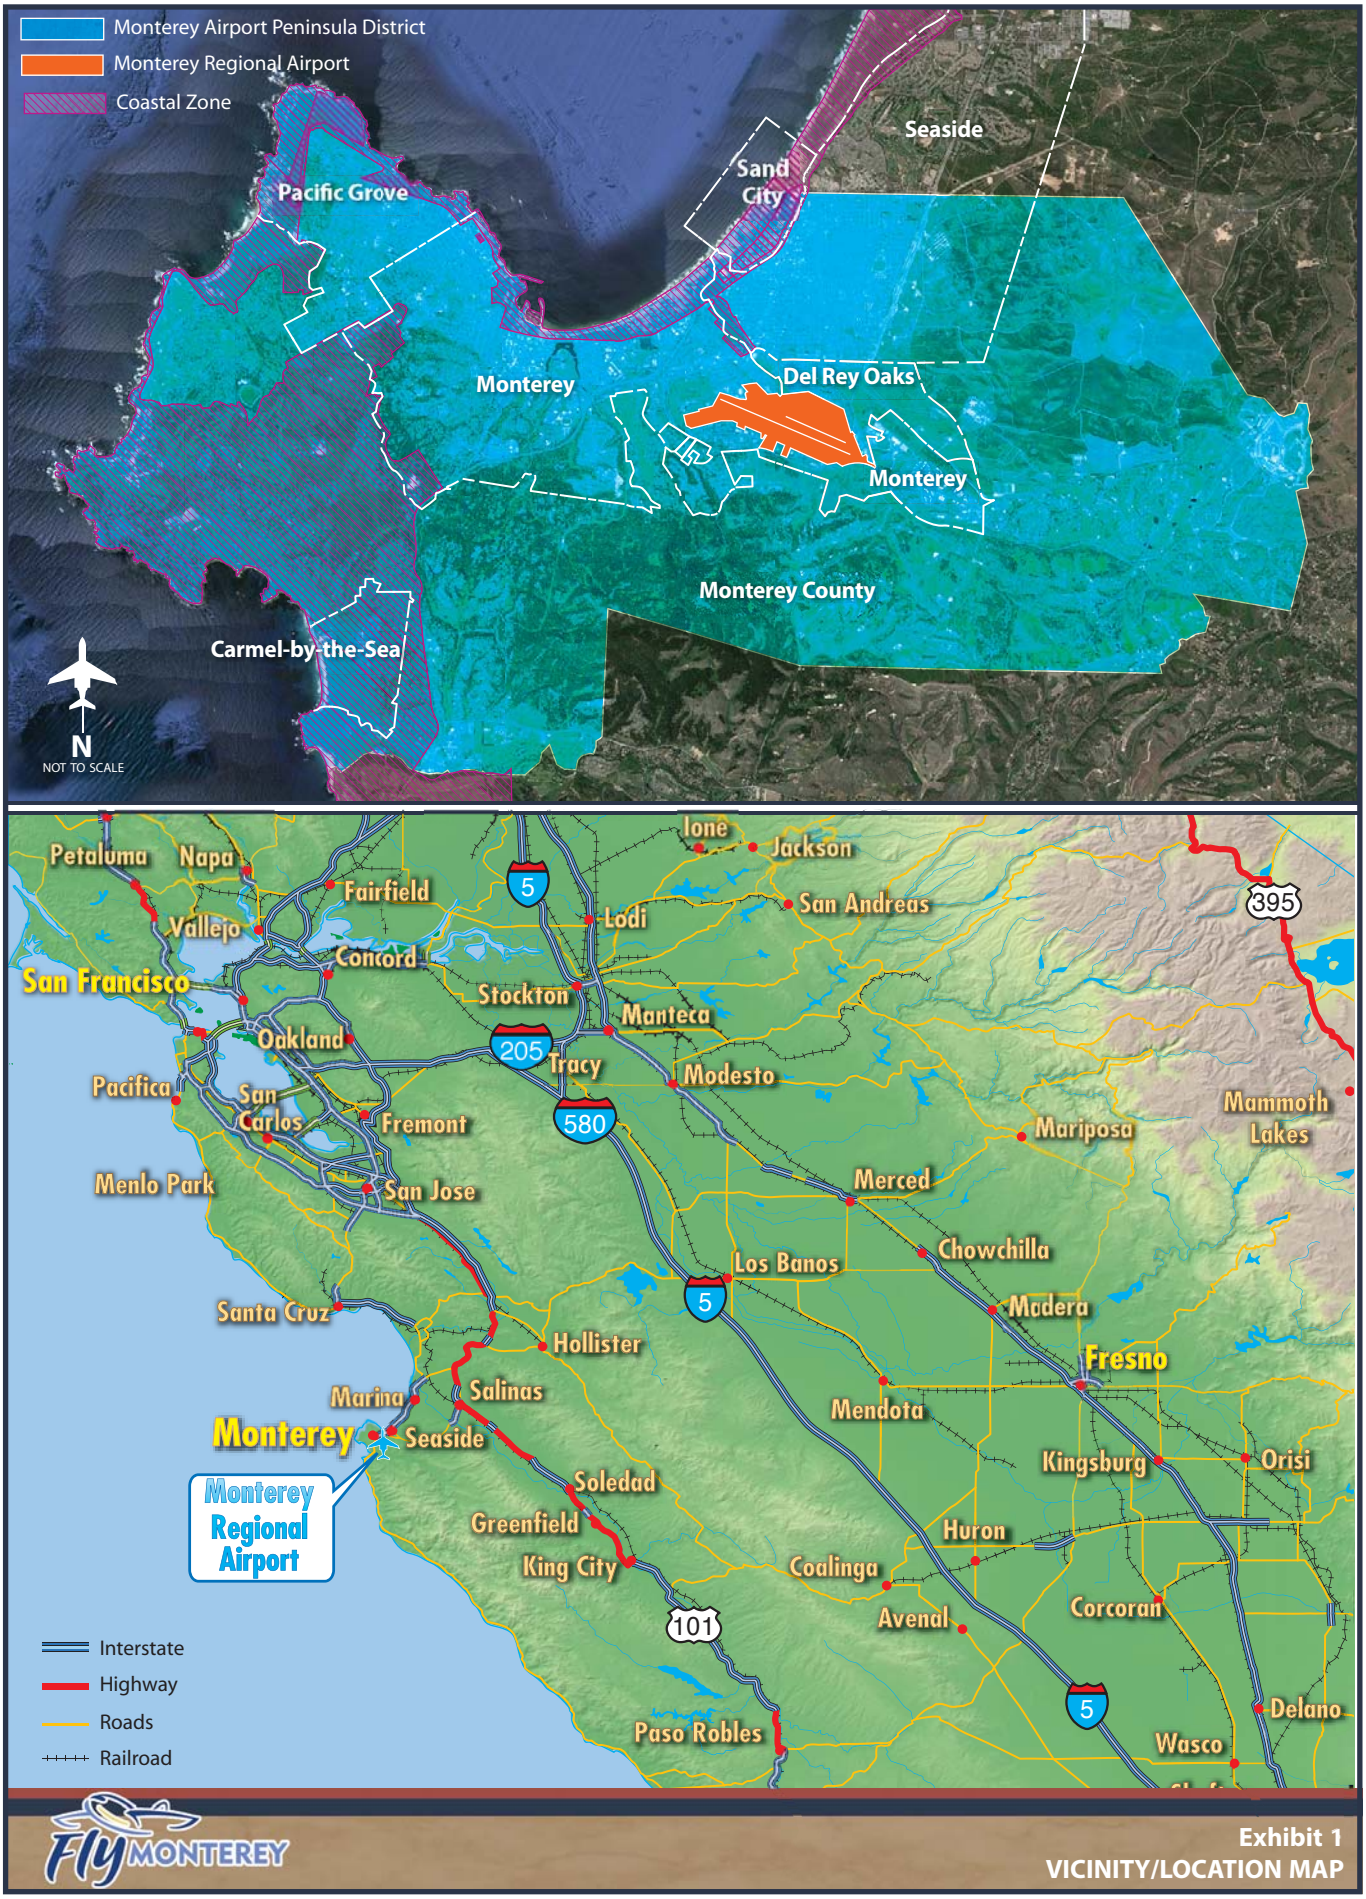

Exhibit 1
VICINITY/LOCATION MAP

The recommended development alternative is shown on **Exhibit 2** and will be discussed in detail in the subsections of this Project Description. Both project-specific and cumulative impacts of the recommended development alternative are discussed in this Initial Study.

Background Information

Existing Airport Facilities. The Airport is included in the 2015 – 2019 *National Plan of Integrated Airport Systems* (NPIAS) (FAA 2014), the *California Aviation System Plan* (CASP) (Caltrans 2013), and the *Monterey Bay Regional Airport System Plan* (AMBAG 2005). It is classified as a "nonhub primary commercial service" airport and maintains a Part 139 Airport Operating Certificate (also known as a Part 139 certification) under Title 14 of the Code of Federal Regulations (CFR) for serving air carrier aircraft as a Class I Airport.[3]

The Airport has two parallel runways. The primary runway, 10R-28L, is 7,175 feet long and 150 feet wide, with a 175-foot displaced threshold on each runway end to meet runway safety area (RSA) requirements for landing. Runway 10R-28L has engineered materials arresting systems (EMAS) on each runway end, also ensuring that the RSAs meet federal safety standards. The secondary runway, 10L-28R, is 3,504 feet long and 60 feet wide. **Table 1** shows the runway characteristics as well as the taxiways, lighting, and navigational aids associated with the airfield facilities. **Exhibit 3** shows the location of the runways, taxiways, and airfield visual approach aids.

Landside facilities at the Airport are those that support aircraft and pilot/passenger handling functions, as well as other non-aviation facilities that provide a revenue stream to the Airport. The primary landside facilities at the Airport are hangar, ramp, and tie-down areas located adjacent to the airfield, as well as fixed base operators (FBOs), the Airport's commercial passenger terminal (Terminal) and related support operations, and an airport rescue and firefighting (ARFF) building. The Airport also has three public self-storage facilities, a recreational vehicle (RV) storage lot, and several office buildings that provide non-aviation revenue support. **Exhibit 4** identifies the locations of these existing landside facilities.

[3] Class I airports are certified to serve scheduled operations of large air carrier aircraft (31 passenger seats or more), unscheduled passenger operations of large air carrier aircraft, and/or scheduled operations of small air carrier aircraft (10 to 20 passenger seats).

TABLE 1
Airside Facility Data
Monterey Regional Airport

Field Elevation: 257.1 above msl	Runway 10R	Runway 28L	Runway 10L	Runway 28R

Aircraft Aviation Forecasts. As previously mentioned, the FAA is responsible for reviewing and approving aviation forecasts developed in conjunction with airport planning studies. These forecasts are then used as a basis for airport planning and development. Thus, a key aspect of the proposed AMP is the use of demand-based planning milestones (based on FAA-approved forecasts).

Table 2 summarizes the key milestones for each of the AMP's three planning horizons: short-term (Years 1-5); intermediate-term (Years 6-10); and long-term (Years 11-20). The AMP's capi-

tal improvement plan (CIP) contains items of highest need and/or priority in its short-term planning horizon. These items should be considered for development based on actual demand levels within the first five years of AMP implementation (i.e., 2016-2020). As short-term horizon activity levels are reached, MPAD will then begin to program for the intermediate-term based upon the next activity milestones. Similarly, when the intermediate-term milestones are reached, it will be time to program for the long-term activity milestones. The specific CIP development components are discussed in a later section of this Project Description.

On-Airport Land Use Plan

The FAA requires that all federally-obligated airports utilize airport property for aviation purposes. However, if an airport has land that is unlikely to be utilized for aviation purposes because it exceeds that which is forecast to be needed or it is inaccessible by aircraft, then airport lands are allowed to be used for compatible non-aviation revenue support purposes.

Correspondingly, there are two primary purposes for an on-airport land use plan. The first is to secure those areas essential to the safe and efficient operation of the airport, taking into account applicable FAA design standards and appropriate planning guidelines. The second is to determine compatible land uses for the balance of the property which will be most advantageous to the airport (i.e., highest and best use). The following land uses are planned for Mon-

terey Regional Airport as shown in **Exhibit 5**. Specific recommended development components of the proposed AMP are discussed in this Project Description in a later section.

Aircraft Operations. The Aircraft Operations Area (AOA) is a restricted and secure area on the airport property designed to protect all aspects related to aircraft operations. It is the portion of airport property that encompasses the major airside elements, such as the runways, taxiways, runway safety area, runway object free area, runway obstacle free zone, runway protection zone (where located on airport property), taxiway safety area, taxiway object free area, navigational aid critical areas, and the runway visibility zone (where applicable).

The AOA is intended for the safe and efficient movement of aircraft to and from the airfield. This land use designation includes the various object clearing areas and, as such, only elements necessary for aircraft navigation can be located here. Many of the safety improvements proposed in the AMP's recommended development alternative are located within the AOA.

Aviation Development. Aviation Development land uses include those areas that should be reserved for development that requires access to the AOA. This might include aircraft hangars, transportation terminals, and air cargo facilities. Any aviation business needing access to the runway and taxiway system could be located in these areas. This land use category has been further subdivided as follows in order to provide additional definition to certain locations on the airfield:

- *General Aviation (small aircraft)*: This subarea encompasses the northwest and north sides of the Airport, which are generally considered to be reserved for general aviation (GA) activities and are intended to accommodate smaller piston-powered GA aircraft activity. This subarea also allows for supporting services, such as those provided by an FBO.

  The proposed On-Airport Land Use Plan (refer to **Exhibit 5**) includes two subareas of this type of GA land use:

  - The first is approximately 26 acres located northwest of the AOA. This area is the site of the former Monterey Naval Auxiliary Station area known as the Old Northside area. The On-Airport Land Use Plan identifies the removal of several existing buildings and the construction of three new buildings.

  - The second is an approximately 25-acre area north of the AOA in the vicinity of the existing Navy Flying Club. The On-Airport Land Use Plan shows additional hangar and taxilane development in this area.

  Both of these potential future development subareas are located within secured areas of the Airport (refer to **Exhibit 5**).

- *General Aviation (large aircraft):* Because the Airport experiences a significant level of activity by operators of business turboprops and jets, the southwest portion of the Air-

port currently supports two FBOs, both of which cater to business aviation operators. No changes are proposed to this subarea of the Airport as part of the AMP.

- *Commercial Aviation*: This subarea includes the proposed Terminal complex and extends from the aircraft parking positions on the airside interface to the airport southern property line west of Olmsted Road and the proposed Terminal loop road east of Olmsted Road. This subarea is reserved for current and future needs in the Terminal area and identifies enough land area to accommodate long-term Terminal growth potential.

Non-Aviation. This land use category allows development that is compatible with airport activities but is unlikely to require access to the runway and taxiway system. Typically, it is preferable that activities in these areas complement airport activities to some degree, but it is not necessarily required. Examples of potential uses include research facilities, offices, laboratories, manufacturing and processing facilities, warehouses, and other facilities compatible with an airport environment. The Airport has several areas already developed with compatible non-aviation uses. For example, part of the Navy golf course is located on airport property in the southwestern corner of the Airport. The Airport also contains an RV storage lot on the north side of the AOA and a public storage lot located on the southeastern side of the AOA.

One new area designated as non-aviation on the On-Airport Land Use Plan (approximately 12.3 acres) would be located along the proposed frontage road to Highway 68 in the vicinity of the new Terminal Complex. Two small areas (approximately 3.2 acres and 3.6 acres) will provide opportunities to locate revenue support businesses. In addition, 5.5 acres located off airport property is proposed to be acquired along Highway 68. This area is also designated as non-aviation on the On-Airport Land Use Plan in keeping with the existing land uses on the property, i.e., the area is currently developed with two office buildings. As discussed later in this Initial Study under South Side Frontage Road within Short-Term Improvements, this area will also be used to locate a frontage road to Highway 68.

The On-Airport Land Use Plan also identifies two areas north of the AOA for future non-aviation development. One is an approximate 9-acre area in the far western corner of the Airport. Formerly part of the Old Northside area, this site currently contains existing buildings and non-aviation land uses. The proposed AMP calls for the future redevelopment of this area.

Other areas on the north side of the airfield not identified for aviation development also are reserved for future "revenue support" functions. Specifically, the Airport has approximately 92.4 acres of undeveloped land that may be used eventually for low intensity, non-aviation development.

Environmental Mitigation Areas/Open Space. There are several areas on the Airport that are known to have sensitive vegetation. Many of these areas have been designated as environmental mitigation areas. Other portions of the property are more simply identified as Open Space because no other land use designation is anticipated at this time. Further, a 100-foot buffer along the northern airport property line is designated as Open Space to provide separation from neighboring residential areas.

Phasing/Capital Improvement Plan

Exhibit 6 depicts the proposed phasing of the recommended development alternative. To accomplish the proposed development, a CIP was developed to provide a program for funding the development components. All recommended development components for the short-, intermediate-, and long-term are listed in **Table 3** and are prioritized based on the needs of the Airport. Each component may require multiple steps, such as environmental evaluation, design, and engineering prior to construction; those elements have been identified separately for funding purposes within the overall CIP. However, for purposes of this Initial Study, the various stages of each component are addressed singularly; that is, the environmental documentation, design and engineering required, while treated separately in the CIP, are part of each overall development component in terms of environmental evaluation.[4]

TABLE 3
Airport Master Plan Capital Improvement Plan
Monterey Regional Airport

Short-Term Program (1-5 Years)	
2017	Property Acquisition (5.5 acres)
2018	Perimeter Fence Improvements
2019	South Side Frontage Road
2020	North Side GA Improvements – Phase 1 (Southeast Hangar Relocation)
2020	Runway 10L-28R Overlay and Improvements (PAPI, Taxiways K and L)
Intermediate-Term Program (6-10 Years)	
Terminal Complex (parking structure, aprons, taxiways, Terminal building, roads, and surface parking)	
ARFF Building	
Demolish Old Terminal Building	
Taxiway A Shift to 327.5 feet from Runway 10R-28L (centerline to centerline); Taxiway "island" Improvements	
North Side Access Road	
Long-Term Program (11-20 Years)	
North Side GA Development – Phase 2	
Maintenance Building	
Runway Protection Zone Land Acquisition (20 acres) & Avigation Easement (14 acres)	
Extend Taxiway B to Runway 28L Threshold	

GA = general aviation
PAPI = precision approach path indicators
ARFF = aircraft rescue and firefighting

Short-Term Improvements

The short-term development components are those anticipated to be needed in years 1 through 5 of the 20-year CIP and are included in the Airport's Five-Year Capital Improvement Program recently submitted to FAA and the California Department of Transportation (Caltrans). These components are discussed in more detail below.

[4] The recommended development alternative also shows four potential sites for relocation of the FAA-owned and operated airport traffic control tower (ATCT). That improvement is not part of the proposed AMP or under the control of MPAD, and, therefore, is not evaluated in this environmental review.

Property Acquisition (5.5 Acres) (2017). A 5.5-acre area off airport property is proposed to be acquired approximately 800 feet east of the Highway 68/Olmsted Road intersection (**Exhibit 6,** Item 2). The area is already surrounded by the Airport on three sides and would be designated as non-aviation on the On-Airport Land Use Plan in keeping with the existing land uses on the property, i.e., the area is currently developed with two office buildings. As discussed below under South Side Frontage Road, this area will also be used to locate a frontage road to Highway 68. No other changes to the area are anticipated as part of the proposed AMP.

Perimeter Fence Improvements (2018). The Airport's *Wildlife Hazard Management Plan* (MPAD 2013) includes an implementation measure entitled, "Pursue the Implementation of Perimeter Fence Modification and Improvements." The purpose of this AMP recommendation is to improve the Airport's control over coyotes, black-tailed deer, and other animals from encroaching upon the Airport.

The proposed perimeter fence includes increasing certain portions of the existing six-foot high fencing to a 12-foot fence with three-strand barbed wire outriggers to prevent deer from jumping the fence and entering the AOA. Furthermore, a four-foot skirt of chain-link fence material, attached to the bottom of the fence and buried at a 45-degree angle on the outside of the fence, is planned in order to prevent coyotes and other animals from digging under the fence, and to prevent washout from rain events. Approximately 10,800 linear feet of fence is proposed to be improved around the southeastern, eastern and central eastern portions of the airport property (**Exhibit 6**, Item 3).

South Side Frontage Road (2019). A "frontage road" that would parallel Highway 68 east from Olmsted Road for approximately 1,500 feet before turning north, west, and then south to reconnect (forming a loop) is proposed (**Exhibit 6**, Item 5). This frontage road would provide access to airport property for the development of non-aviation uses and would allow for the potential closure of two access drives off Highway 68 that serve private property located at 2801 and 2901 Salinas Highway (Highway 68). As shown on **Exhibit 6**, construction and use of the frontage road would require the acquisition of a roadway easement across private property, or the acquisition of the property itself (approximately 5.5 acres) (**Exhibit 6,** Item 2).

The proposed roadway improvements shown on **Exhibit 6** identify conceptual locations only. Future roadway locations will be refined during environmental review and project design.

North Side GA Improvements – Phase 1 (Southeast Hangar Relocation) (2020). The proposed AMP includes improvements to the north side GA area in order to relocate tenants on the southeast side of the Airport to the north side before the planned Terminal relocation begins (**Exhibit 6**, Item 7). The north side GA area currently contains six Port-a-Port T-hangars and the Monterey Navy Flying Club Hangar (as well as an above ground fuel tank for Avgas) and provides a total of approximately 9,600 square feet (sf) of aircraft storage space, 2,600 sf of maintenance/office space, and an approximate 181,000-sf GA aircraft apron (AMP, Exhibit 1M and Table 1M; MPAD 2014 [ALP]). The southeast GA uses to be relocated to the north side includes 60,700 sf of aircraft storage space and 18,000 sf of maintenance/office space (AMP, Exhibit 1M and Table 1M).

Construction in the north side GA area will consist of site preparation, apron and taxilane pavement, utilities, fencing, and interior access roads. One new taxiway connector to Taxiway

DRAFT

Exhibit 6
PROJECT PHASING

This page intentionally left blank

C is also planned. Hangars currently located at the Airport's existing southeast GA area may be purchased (at fair market value) and relocated as a part of this development component. Although additional future improvements such as the construction of hangars or a new fuel farm are not included in the proposed AMP's CIP, space is provided for approximately 31 T-hangars, 22 box hangars, two conventional hangars, and a fuel island within the improved GA area. As such, this level of development has been used as the basis for the environmental analysis provided in the Initial Study. Investors, such as FBO operators, or other means of financing revenue-producing facilities may be necessary to construct these facilities.

Runway 10L-28R Overlay and Improvements (PAPI, Taxiways K and L) (2020). Parallel Runway 10L-28R is the sole remaining AOA that has not received a recent pavement treatment. The pavement condition has reached the point of needing an overlay to extend/maintain its useful life. Therefore, the AMP proposes to apply an asphalt overlay to the entire parallel runway length (**Exhibit 6**, Item 8). Concurrent with the runway overlay, connecting Taxiways K and L between the runway and Taxiway B will be reconstructed to the FAA's standard 90-degree angle. Their current 45-degree position make them appear to be high-speed exits and can cause confusion for pilots. The AMP also proposes to install precision approach path indicator (PAPI-2L) lights on both ends of Runway 10L-28R to enhance pilot landing operations.

Intermediate-Term Improvements

The intermediate-term development components are those that are anticipated to be necessary in years 6 through 10 of the 20-year CIP. These components are not tied to specific years for implementation; instead, they have been prioritized so that Airport management has the flexibility to determine when they need to be pursued based on then-current conditions. It is not unusual for certain components to be delayed or advanced based on changing conditions, such as funding availability or changes in the aviation industry.

Commercial Passenger Terminal Relocation. The forecasts of aviation demand for the Airport and the Terminal building capacity analysis indicate that the current Terminal is at approximately 92 percent capacity (AMP, Exhibit 3D). Within the next six to ten years, if forecast demand is realized, the existing building will be undersized. In addition, several functional areas of the existing facility, (i.e., Transportation Security Administration [TSA] baggage screening, the baggage claim lobby, concourse circulation, concessions, rental car queue areas, and administrative space) are already undersized and/or inefficiently situated.

Portions of the existing Terminal building are over 60 years old and additions to the original structure have created inefficiency, especially on the secure side of the building. Also, the existing Terminal building penetrates the Federal Aviation Regulations (FAR) Part 77 transitional surface for the Airport, which is an imaginary airspace surface emanating from the edge of the primary surface at a 7:1 ratio.[5]

[5] The primary surface at an airport is typically 1,000 feet wide (centered on the runway); thus, the transitional surface begins at 500 feet from the runway centerline. Since the existing Terminal building is located 500 feet from the Runway 10R-28L centerline, the Terminal penetrates the transitional surface from its base up and there is currently obstruction lighting in place.

The AMP proposes to construct a new Commercial Passenger Terminal complex and then demolish the existing Terminal building (**Exhibit 6**, Items 11, 13, 15, 17 and 18). The recommended Terminal building location and layout is shown in **Exhibit 7**. The proposed layout incorporates a two-story, linear building with three surface parking lots and two parking structures. The Terminal building itself will contain 100,000 sf of physical space; an estimated 600 parking spaces will be provided in a four-level parking structure within a Terminal loop road, with an additional 90 spaces in a rental car lot positioned adjacent to the Terminal building. Two additional surface parking lots and one three-level parking structure are shown along Fred Kane Drive to provide another 833 parking spaces. The total number of parking spaces proposed (1,523) exceeds the long-term forecast demand for airport parking (1,209) and will be constructed, as necessary, in conjunction with the anticipated demand.

The Terminal development component will also include the construction of a new commercial apron in front of the Terminal building and two connector taxilanes between the apron and Taxiway A. One of the goals of the Terminal Relocation component is to provide additional depth to the Terminal's aircraft apron. The existing commercial apron is long and narrow, which necessitates parallel aircraft parking for the larger aircraft using the Airport (i.e., the MD-80 series, design aircraft[6]) as well as operating restrictions on Taxiway A. The approximate dimensions of the new commercial apron are 350 feet wide by 1,350 feet long, with the exception of the southeastern corner where a steep slope is a topographical constraint. As shown on **Exhibit 7**, the proposed apron will accommodate several large aircraft, including ones from the MD-80 series, without either Taxiway A restrictions or the need to park parallel to the Terminal building, as is sometimes currently necessary. Based on the analysis contained in the AMP, space should be available on the commercial apron for five aircraft boarding gates, with at least one that can accommodate the critical design aircraft.

Roadway Improvements. The new Terminal complex will continue to use the existing Terminal's access off Highway 68 via Olmsted Road as its primary access point. However, to reduce impacts to the highway from future airport development, a roundabout is proposed to facilitate traffic flow. A second roundabout is proposed at the intersection of Garden Road and Olmsted Road, which will connect to the Terminal loop road.

The proposed roadway improvements shown on **Exhibit 7** identify conceptual locations only. Future roadway locations will be refined during environmental review and project design.

Aircraft Rescue and Firefighting Building Relocation. Part 139 airports, such as Monterey Regional Airport, are required to provide ARFF services during commercial air carrier operations. The Airport's ARFF facility is outdated and does not meet modern design standards. Similar to the existing Terminal building, it is located only 550 feet from the centerline of Runway 10R-28L, making it an obstruction to the FAR Part 77 transitional surface. Therefore, the new Terminal complex includes two options for a replacement ARFF building to the west of the new commercial apron (**Exhibit 6**, Item 12). Either of these locations will: 1) keep the ARFF building

[6] An airport's critical design aircraft is used to define the design parameters for an airport and is based on the most demanding category of aircraft, or family of aircraft, which conducts at least 500 itinerant operations per year at an airport or the most demanding aircraft in regularly scheduled commercial service. Both the existing and future (2033) design aircraft at the Monterey Regional Airport is represented by the Boeing MD88 aircraft.

in proximity to the Terminal building; 2) allow for response times to the airfield that meet FAA requirements; and 3) meet FAA safety standards (i.e., a maximum height of 28 feet will allow the building to remain outside of the FAR Part 77 transitional surface).

Taxiway A Relocation and Associated Improvements. Once the Terminal building has been relocated, it is feasible to complete a long-term solution to the Taxiway A separation issue. Therefore, the AMP proposes to shift the remaining portions of Taxiway A to 327.5 feet of separation (centerline to centerline) from Runway 10R-28L, thus making a uniform separation for the entire Taxiway A (**Exhibit 6**, Item 19 and **Exhibit 8**). The taxiway separation between Taxiway A and Runway 10R-28L currently varies from 275 feet to 327.5 feet with the 275-foot separation occurring along the existing commercial apron and passenger Terminal; the FAA standard for parallel taxiway-runway separation (centerline to centerline) is 400 feet for airports with design aircraft and visibility minimums[7] similar to Monterey Regional Airport. The Airport has been operating under a conditional waiver of this standard from FAA, which stipulates that a large aircraft (B-737 or higher) may not use Taxiway A when another large aircraft is operating on the runway. Since the recommended long-term solution for the Taxiway A/Runway 10L-28R separation still does not meet FAA standards, a Modification to Design Standard will be necessary.[8] Initial discussions with the FAA on this request have been conducted.

Other taxiway improvements associated with the Taxiway A shift include apron "islands," which will prevent direct access from the apron areas to the runway at Taxiways G and J. On the north side of Runway 10R-28L, Taxiway G between Taxiway B and the runway will be closed to prevent direct access.

North Side Access Road. The north side of the Airport is relatively undeveloped. The existing facilities that are present on the north side, however, are accessed via Airport Road from the west, which is a circuitous route through a residential neighborhood. If additional development occurs which increases vehicular traffic to the Airport's north side, a different, more direct, access route should be provided. Therefore, the AMP includes an additional proposed north side access road that would connect Highway 218 with the on-airport eastern vehicle service road via Del Rey Gardens Road (**Exhibit 6**, Item 20). Steep terrain and use of the northern portion of the eastern vehicle service road will require a significant level of design and engineering. Further environmental study based on preliminary design will be required prior to development of any north side access road.

[7] A visibility minimum is the distance that a pilot needs to be able to see the runway environment on approach to landing.

[8] If the Airport were to try to provide the entire 400-foot separation by moving Taxiway A, the standard distance from Runway 10R-28L, it would leave approximately seven feet between the existing Terminal building and the near edge of the taxiway, effectively eliminating any commercial apron in front of the Terminal building. In addition, the taxiway would also impact several hangar and FBO aprons. Further, even if the Terminal is relocated, a 400-foot separation would still render much of the south side apron unusable due to the elimination of existing hangar apron frontage. Also, some of the hillside that runs parallel to Taxiway A on the east end of the runway would penetrate the taxiway object free area by approximately 150 feet.

Long-Term Improvements

Long-term development components are those that are anticipated to be needed in years 11-20 of the 20-year CIP. Like the intermediate-term components, these components are not tied to specific years for implementation; instead, they have been prioritized so that Airport management has the flexibility to determine when they need to be pursued based on then-current conditions. It is not unusual for certain components to be delayed or advanced based on changing conditions, such as funding availability or changes in the aviation industry.

North Side GA Development. Future construction of an expanded GA area on the northeast side is also considered to accommodate continued growth in based aircraft at the Airport (**Exhibit 6**, Item 21). Thus, the AMP proposes pavement, utilities, fencing, interior access roads and site preparation for additional hangar development. Overall, the recommended development alternative shows space for an additional 106 nested T-hangars and a second taxiway connector to Taxiway C. As such, this level of development has been used as the basis for the environmental analysis in this Initial Study. Investors, such as FBO operators, or other means of financing revenue-producing facilities may be necessary to construct these facilities.

Airport Maintenance Building and Yard. A consolidated airport maintenance building and yard is proposed on the northeast side of the Airport (**Exhibit 6**, Item 22).

Property Rights Acquisition for Runway 28 Runway Protection Zones. The AMP proposes to acquire controlling rights of lands that fall within the Runway 28 runway protection zones (RPZs) (**Exhibit 6**, Item 23). The FAA recommends that airports own or control their RPZ areas and, if possible, maintain them clear of incompatibilities such as roads, structures, and places of gathering. The Airport does not currently own or control all of the Runway 28 RPZ lands. Approximately 20 acres is currently undeveloped and is identified for fee simple acquisition as part of the proposed AMP. Approximately 14 acres is developed land that is identified for avigation easements. In this case, the Airport will need to work with the surrounding municipalities (cities of Del Rey Oaks and Monterey) to ensure appropriate zoning is in place. In lieu of fee-simple acquisition, a combination of avigation easements and zoning can also have the desired result of protecting the Airport from encroachment.

Taxiway B Extension. The AMP proposes to extend Taxiway B to the Runway 28 thresholds (**Exhibit 6**, Item 24). This improvement will reduce the number of runway crossings by aircraft on the north side of the runway desiring to depart Runway 28L.

Non-Aviation Development

Redevelopment of Old Industrial Area (Short-Term). The AMP designates an area as non-aviation development to allow for the redevelopment of approximately nine acres of an old industrial area of the Old Northside military complex (**Exhibit 5**). This redevelopment is anticipated to occur in the short-term planning horizon of the Master Plan (i.e., 1-5 years). The area is located between the existing off-airport naval research and meteorological center and an on-airport hangar area and contains twelve permanent buildings of varying size and age as well as four temporary buildings.

TAXIWAY A - LONG-TERM SOLUTION

This page intentionally left blank

To facilitate the redevelopment, approximately 65,000 sf of permanent building space (**Table 4**) and approximately 4,400 sf of modular building space (Building Nos. 1102, 1106, 1110, and 1114) will be removed; one newer building with an approximate 20,500-sf building footprint (No. 1118) will remain. It is assumed, for purposes of this environmental analysis, that in evaluating replacement buildings consideration will be made for replacement buildings that are similar in nature to what currently exists (i.e., generally single-story office, light industrial, and storage facilities with building coverage over roughly 25 percent of the redevelopment area). Based on this assumption, approximately 98,010 sf of building space could occur in the area, resulting in approximately 77,360 sf of new building space and a net increase of approximately 8,160 sf.[9] Approximately 6.75 acres of the area will be used for parking, circulation, and landscaping.

TABLE 4
Existing Permanent Buildings to be Removed by Non-Aviation Redevelopment
Monterey Regional Airport

Building No.	Description of Building	Year Built	Year Modified	Building Size (Square Feet)
117/105A	Tenant Building	1949	1968	4,020
505	Tenant Building	Pre-1961	N/I	7,000[1]
1101	Tenant Building	Circa 1985	N/A	3,200
1105	Tenant Building	1943	1050	7,754
1109	Tenant Building	1943	1991	480
113, 105, 109	Two tenant buildings (Quonset huts) with connector	1944	2001	8,600
102	Tenant Building	1970	1980	6,900
104	Tenant Building	1970	1980	7,350
106	Tenant Building	1970	N/A	3,000[1]
517/1174[2]	Tenant Building	After 1998	N/I	16,500[1]
TOTAL:				**64,804**

N/I = no information available; N/A = not applicable
[1] Estimated building footprint using Google Earth.
[2] Two building numbers denote separate floors of the same building.

Source: SWCA 2014. *Historic Resources Assessment and Survey Report, Monterey Regional Airport, Monterey, California.*

South Non-Aviation Development Areas (Short-Term). This non-aviation development will be approximately 12.3 acres located along the proposed frontage road to Highway 68 (**Exhibit 5**). These areas are anticipated to be developed within the short-term planning horizon for the proposed AMP, provided the necessary infrastructure is available.

For purposes of this Initial Study, it is assumed that approximately 25 percent of the site will be developed with building space, and 75 percent will be developed with parking, driveways, roadways and landscaping, allowing for approximately 75,000 sf of building footprint and five

[9] 9 acres x 0.25 building coverage = 2.25 acres of total building space (98,010 sf). 98,010 sf – 20,650 sf (existing building to remain) – 64,804 sf (permanent buildings to be removed) – 4,400 sf (modular buildings to be removed) = 8,156 sf of net building space.

acres of parking and landscaping. However, setbacks from Highway 68 may further reduce the feasible building square footage. Other properties along the highway, for example, at 2901 and 2959 Salinas Highway, have building coverage of less than 20 percent, while the building coverage at 2801 and 2901 Salinas Highway is less than 10 percent.

Non-Aviation North Side Reserve (Intermediate-/Long-Term). As previously discussed under the On-Airport Land Use Plan section, other areas on the north side of the airfield not identified for aviation development are reserved for future "revenue support" functions. The Airport has approximately 92.4 acres of undeveloped land in this area that may be eventually used for non-aviation development. This acreage could possibly accommodate low intensity light industrial, commercial or office development uses, or land uses that do not generate significant traffic, such as solar arrays or environmental mitigation banks.

The existing terrain within this acreage is varied and does not lend itself to large flat development complexes. Rather, both buildings and parking will need to be designed with sensitivity to the topographical constraints of this area of the Airport. Similarly, there are numerous sensitive biological features to be considered. It is likely that at least half of the area will remain in undeveloped open space. Thus, any development in this area will be characterized as low intensity development, rather than medium or high intensity land use.

As listed in **Table 3** and discussed previously under *Phasing/Capital Improvement Plan*, a north side access road is necessary to provide additional access in the event that any future non-aviation development generates significant traffic volumes. In order to determine whether and when such additional access is necessary, an appropriate triggering threshold for roadway construction will be developed based – in part –on an analysis of existing traffic conditions, particularly in the Casanova - Oak Knolls neighborhood. Any development generating significant traffic volumes in the North Side Reserve is assumed to occur in the intermediate- or long-term planning horizon of the proposed AMP, in conjunction with additional north side access.

For purposes of evaluating the possible environmental impacts of future low intensity light industrial, commercial, or other non-aviation activity north of the airfield, it is assumed that there will be an approximate 25 percent overall building coverage and 25 percent overall site coverage (i.e., pavement, parking structures, and landscaping), clustered in the less environmentally sensitive areas. As indicated above, the balance of the site coverage (i.e., 50 percent) is assumed to remain undeveloped open space, due to biological and topographical constraints. This development coverage assumption is higher than what is occurring along Highway 68 in proximity to the Airport and is considered a worst-case analysis. Using a 25/25 percent site coverage assumption, approximately 1,000,000 sf of light industrial, commercial, or other non-aviation building space and approximately 23 acres of pavement, parking, and landscaping might occur.[10]

[10] It should be noted that a previous feasibility study of the area found that costs for site development, infrastructure, and environmental mitigation would be appreciable and may preclude many types of non-aviation development (MPAD 2011).

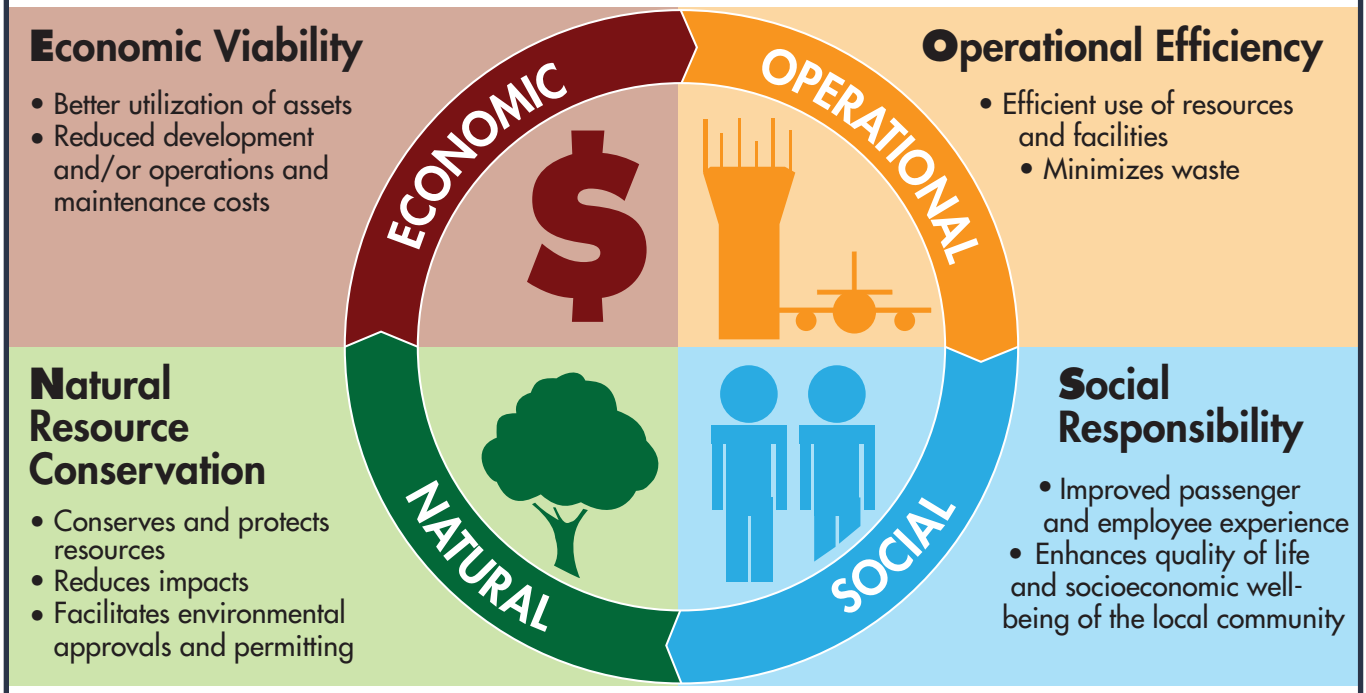
Sustainability Action Plan

The proposed AMP also includes a Sustainability Action Plan (AMP, Appendix D). An applicable definition of sustainability specific to airports has been established by the Airports Council International-North America (ACI-NA): "a holistic approach to managing an airport so as to ensure the integrity of the **E**conomic viability, **O**perational efficiency, **N**atural resource conservation, and **S**ocial responsibility [EONS] of the airport" (see **Exhibit 9**).

MPAD has already implemented sustainability principles into its decision-making process and has incorporated several successful sustainability initiatives. For proposed future development components, such as the construction of new Terminal and ARFF buildings, MPAD plans to seek Leadership in Energy and Environmental Design (LEED) certifications, which require a number of sustainable prerequisites and credits. Other successful MPAD-adopted sustainability initiatives at the Airport include several energy-saving lighting projects, the installation of several electric vehicle (EV) charging stations, the purchase of electric vehicles, a Terminal recycling program, the installation of low-water use Terminal fixtures, and use of an energy-efficient film on the windows and doors along the airfield side of the Terminal.

As MPAD begins working towards its sustainability goals and objectives, it is important to identify performance targets so that there is a clear understanding of what the program aims to accomplish. Setting targets makes it easier to communicate the program goals internally (within MPAD organization) and externally (local/regional governments, community organizations, local residents). Targets should be realistic and reasonable to ensure the validity of the program. The following Sustainability Action Plan (**Table 5**) prioritizes various initiatives identified in the AMP as well as provides key performance indicators (KPIs) to evaluate the effectiveness of the plan.

Airports Council International-North America (ACI-NA)
EONS Approach to Sustainability



Economic Viability - Refers to maintaining high and stable levels of economic growth and including the continued business viability of an airport enterprise, the tangible assets created by capital investments at the airport, and the direct and indirect economic impact on the region. This impact includes the value added to public and private sectors through investments in partnerships, tax payments, and other contributions.

Operational Efficiency - An airport's management structure and ability to leverage operations and maintenance monies to promote efficient use of resources and minimize waste.

Natural Resource Conservation - Refers to protecting the environment with a focus on the natural resources that are used or affected as a result of airport operations and the ecosystem in which these resources are located.

Social Responsibility - Refers to a broad set of actions that ensure organizational goals are achieved in a way that is consistent with the needs and values of the local community.

FLY MONTEREY

Exhibit 9
ACI-NA EONS APPROACH TO SUSTAINABILITY

TABLE 5
Sustainable Action Plan & Key Performance Indicators (KPIs)
Monterey Regional Airport

Initiatives Prioritization	KPI (Metric/Frequency)
1. Distribute press releases and provide website updates (on the MRY Sustainability webpage) regarding specific airport projects and sustainability accomplishments.	Press releases/website updates (semi-annual)
2. Use social media to promote the Airport's sustainability accomplishments.	Social media site metrics (i.e., likes, followers, etc.)
3. Develop and provide free, internet accessible (on MRY Sustainability webpage) learning material and tutorials for public schools on the topics of aviation and environment/sustainability.	Students reached through program (#/year)
4. Expand metering to facilitate accurate measurement of water use.	Buildings and irrigated areas equipped with sub-meters (#)
5. Develop and implement sustainable landscaping guidelines/ specifications that require plantings to be low-maintenance, drought resistant, and native species that are non-wildlife attracting for MRY and tenants.	Water usage (gallons/month)
6. Support efforts of the airport industry – including those of the FAA, commercial air carriers, and aircraft manufacturers – to develop air quality and GHG emission benchmarking databases that improve the understanding of the relative efficiencies of aviation operations.	GHG emissions inventory (biennially)
7. Provide incentives, such as rebates and/or preferred parking, for staff vanpools/carpools and alternatively fueled vehicles.	Employee survey results (#/year)
8. Provide subsidized bus passes to employees and construction workers.	Employee survey results (#/year)
9. Post no-idling signs in the terminal area and incorporate anti-idling policies into lease agreements.	Terminal traffic observations
10. Support single/reduced engine taxiing procedures authorized by the FAA and encourage the use of quiet technology when feasible.	Pilot survey results
11. Pursue LEED Certification or equivalent for future MPAD facilities including a future terminal building: • Consider light colored "cool" roofs and cool pavements; • Install window awnings, sunshades, or window tinting in appropriate areas and maximize the use of natural lighting; • Optimize the energy efficiency and control of the conveyor motors in the baggage handling system; • Install a solar photovoltaic system to generate on-site renewable energy; • As technologically available, install energy efficient elevators and escalators; • Recycle used non-potable water for landscaping, machine washing, urinal and toilet flushing, custodial uses, etc. to the extent allowed by the *Safe Drinking Water Act of 1974;* • Install metered irrigation systems that automatically shut off when it is raining; • Promote Monterey Peninsula eco-tourism by installing carbon-offset kiosks where passengers can purchase offsets for their flight and discover the environmental impact of their flight; and/or • Support bicycle use by airport employees and the air traveling public by providing convenient, secure bicycle facilities for use on airport premises.	MPAD policy • Electrical usage (kilowatt hours/month) • Water usage (gallons/month) • Kiosk usage and revenue (#/$/month) • Employee and traveler survey results (#/year)
12. Use Envision™ rating system to assess the sustainability performance of airport infrastructure projects and development programs.	MPAD policy

TABLE 5 (Continued)
Sustainable Action Plan & Key Performance Indicators (KPIs)
Monterey Regional Airport

Initiatives Prioritization	KPI (Metric/Frequency)
13. Perform a baseline energy audit and conduct and implement recommendations periodically.	Electrical and natural gas usage (kilowatt hours/therms/month)
14. Integrate sustainability language and requirements into future airport lease agreements, amendments and/or renewals.	% tenant contracts with sustainable language
15. Start a Green Procurement Program.	MPAD Procurement policy
16. Develop and implement a Green Concessions Policy.	MPAD Concessions policy
17. Provide food waste collection bins to separate food waste from normal waste to enhance composting opportunities.	Food waste collected (pounds/month)
18. Conduct a waste composition study (waste audit) tracking waste use/composition no less than every 24 months.	Waste audit report
19. Develop and implement an Integrated Solid Waste Management Plan.	Recycled materials diverted from landfill (tons recycled per enplanement/month)
20. Install cisterns to capture rainwater.	Water usage (gallons/month)
21. Continue the transition to all LED or equivalent lighting on the airfield, within terminal buildings, and in connection with surface and parking lot security lighting.	Electrical usage (kilowatt hours/month)
22. Transition to alternatively-fueled ground support equipment (GSE), generators, shuttle buses, and taxis to the extent reasonable and feasible.	Fuel usage (gallons/month)
23. Install an on-site alternative fuel (CNG, biofuel, EV, hydrogen) vehicle refueling station.	Fuel flowage (gallons/ kilowatt hours/month)
24. Collaborate with local transit operators to expand public transit opportunities to the Airport.	Employee and traveler survey results (#/year)

NOTE: Refer to the List of Acronyms at the end of this report for definitions of abbreviations used in this table.

6. **General Plan Designation:** Since the Airport is located within a Special District (i.e., MPAD), there are no General Plan designations applicable to airport property with four exceptions. Airport property located on the northwest corner of the intersection of Highways 68 and 218 is within the City of Del Rey Oaks. This area is designated as Neighborhood Commercial on the City of Del Rey Oaks General Plan land use map (City of Del Rey Oaks 1997) and would not be changed by the proposed AMP.

   Airport property that is located on the northwest corner of Garden Road and Olmsted Road on Assessor Parcel Number (APN) No. 013321009000; airport property located directly east of Olmstead Road and abutting Highway 68 to the north; and airport property abutting Highway 68 within APN No. 013221015000 is within the City of Monterey and designated as Industrial by the City (City of Monterey 2015).

   The proposed AMP, once adopted, will provide the blueprint for land use planning overall at the Airport for the next 20 years.

7. **Zoning:** See discussion above under General Plan Designation. There are no local zoning ordinances over airport property with four exceptions. Airport property located on the

northwest corner of the intersection of Highways 68 and 218 is zoned as Neighborhood Commercial (C-1) or Neighborhood Commercial with a Visitor Overlay District (C-1-V) on the City of Del Rey Oaks zoning map (City of Del Rey Oaks 2015).

Airport property that is located on the northwest corner of Garden Road and Olmsted Road on APN No. 013321009000 is within the City of Monterey and is zoned I-R-130-RA (Industrial, Administration, Research District – 130,000 sf minimum – Religious Assembly District). Airport property that is located directly east of Olmstead Road and abutting Highway 68 to the north is within City of Monterey and zoned I-R-130-D2 (Industrial, Administration, Research District – 130,000 sf minimum – Development Control Overlay District). Airport property abutting Highway 68 within APN No. 013221015000 is also within the City of Monterey and zoned I-R-130-D2 (City of Monterey 2015).

The Airport is located outside of the Coastal Zone.

8. **Surrounding Land Uses and Setting:** The Airport is located in the Monterey Bay area approximately two miles southeast of downtown Monterey and just over one mile from the Monterey Bay and the Pacific Ocean. The Airport is bordered by the City of Del Rey Oaks to the north and east, and the City of Monterey to the south and west (refer to **Exhibit 1**). Land uses in proximity to the Airport include the U.S. Navy golf course, a government research complex (includes the Fleet Numerical Meteorology and Oceanography Center, Naval Research Laboratory, and National Weather Service), residential neighborhoods, agriculture, and commercial and light industrial development along Highways 68 and 218. To the south of Highway 68 is open space located within Monterey County.

   Topography on the Airport is nearly flat in areas directly adjacent to the runway, but slopes steeply at the western and eastern ends creating a plateau. On the north side of the airfield, topography is more varied with several hills and drainages. Elevation at the Airport ranges from approximately 125 feet above mean sea level (msl) to 300 feet above msl.

   The airport property supports several plant communities, including sensitive communities such as maritime chaparral, coast live oak woodland, and Monterey pine forest. Numerous types of sensitive plants have also been documented on the property as well as in the general area.

   Within the Monterey area, Highways 1 and 68 are designated as scenic highways and provide scenic views of the ocean and wooded hills along their respective corridors.

9. **Other Agencies Whose Approval is Required (e.g., permits, financing approval, or participation agreement)**

   Approval of the AMP is primarily a discretionary action by the MPAD Board, and is dependent upon Board certification of an appropriate CEQA document prior to taking action on the

AMP. The FAA is involved in the AMP approval process as well through its acceptance of the AMP forecasts and an updated ALP.

Individual components of the AMP may involve design approval by FAA and/or Caltrans, depending on the type of improvements and funding. Environmental compliance review under NEPA is also conducted by FAA for those individual components of the AMP that require a federal discretionary action, including funding or revisions to the ALP.

Other permits or approvals that may be required for individual components of the proposed AMP are listed below:

- Caltrans Right-of-Way Encroachment Permits for improvements to Highway 68 and/or Highway 218.
- City of Monterey approval for improvements to Olmsted Road.
- City of Del Rey Oaks approval for improvements to Del Rey Garden Road.
- U.S. Fish and Wildlife Service (USFWS) Incidental Take Permits under Section 7 or Section 10 of the *Endangered Species Act* or the *Migratory Bird Treaty Act* (MBTA).
- California Department of Fish and Wildlife (CDFW) 2081 Incidental Take Permits.
- CDFW Streambed Alteration Agreement under Section 1602 of the California Fish and Game Code (CFGC) if changes are proposed to any onsite detention basins or ponds that support riparian vegetation.
- Approval from the California Regional Water Quality Control Board (RWQCB) for modifications to the Airport's stormwater pollution prevention plan (SWPPP).
- Approval from the State Historic Preservation Officer (SHPO) regarding the presence and/or treatment of cultural resources.
- Completion of Form AD-1066 by the U.S. Department of Agriculture, Natural Resources Conservation Service (USDA-NRCS) related to the conversion of farmland of statewide importance.
- Construction permit from the RWQCB related to applicable National Pollutant Discharge Elimination System (NPDES) General Construction permitting requirements.
- Construction Traffic Phasing Plan approval from Caltrans for haul routes with direct access to Highways 68 and/or 218.
- Review of the proposed AMP, its noise contours, and its safety zones by the Monterey County Airport Land Use Commission (ALUC).

10. Environmental Factors Potentially Affected:

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" or a "Less Than Significant with Mitigation Incorporated" impact as indicated by the checklist on the following pages.

☒	Aesthetics	☒	Agriculture and Forestry Resources	☒	Air Quality
☒	Biological Resources	☒	Cultural Resources	☒	Geology /Soils
☒	Greenhouse Gas Emissions	☒	Hazards & Hazardous Materials	☒	Hydrology / Water Quality
☒	Land Use / Planning	☐	Mineral Resources	☒	Noise
☒	Population / Housing	☒	Public Services	☒	Recreation
☒	Transportation/Traffic	☒	Utilities / Service Systems	☒	Mandatory Findings of Significance

11. Determination:

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because the mitigation measures described on an attached sheet have been added to the project. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find the proposed project MAY have a significant effect(s) on the environment, but at least one effect: 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards; and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets, if the effect is a "potentially significant impact" or "potentially significant unless mitigated." An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, there WILL NOT be a significant effect in this case because all potentially significant effects: (a) have been analyzed adequately in an earlier EIR pursuant to applicable

standards; and (b) have been avoided or mitigated pursuant to that earlier EIR, including revisions or mitigation measures that are imposed upon the proposed project.

Shelley Glennon — 12/1/15

Signature — Date

Shelley Glennon, Planning Manager – Environmental
Monterey Peninsula Airport District

1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4) "Negative Declaration: Less Than Significant with Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures and briefly explain how they reduce the effect to a less than

significant level (mitigation measures from "Earlier Analyses," as described in (5) below may be cross-referenced).

5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration (CEQA Guidelines, Section 15063(c)(3)(D)). In this case, a brief discussion should identify the following:

   a) Earlier Analysis Used. Identify and state where they are available for review.

   b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of, and adequately analyzed in, an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

   c) Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6) Lead agencies are encouraged to incorporate into the checklist references information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

7) Supporting Information Sources. A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.

8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.

9) The explanation of each issue should identify:

   a) the significance criteria or threshold, if any, used to evaluate each question; and

   b) the mitigation measure identified, if any, to reduce the impact to less than significance

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
I. AESTHETICS				
Would the project:				
a) Have a substantial adverse effect on a scenic vista?	X	☐	☐	☐
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state-designated scenic highway?	X	☐	☐	☐
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	X	☐	☐	☐
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	X	☐	☐	☐

Impact Analysis

I a-d) Potentially Significant Impact. The proposed AMP includes development along Highway 68, a State and County-designated scenic highway. Residential and recreational land uses are also located in proximity to the Airport. Implementation of the AMP would involve both changes in lighting sources on the Airport and, potentially, glare from solar panels proposed as

part of a sustainability plan, as well as the new buildings and parking structures. Potential impacts to scenic viewsheds and resources, visual character and quality, as well as new sources of light and glare will need to be further evaluated in an EIR.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
II. AGRICULTURE AND FOREST RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.				
Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	X	☐	☐	☐
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	X
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code, Section 12220(g)), timberland (as defined by Public Resources Code, Section 4526), or timberland zoned Timberland Production (as defined by Government Code, Section 51104(g))?	☐	☐	☐	X
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	X
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	X

Impact Analysis

II a) Potentially Significant Impact. Although much of the Airport is already developed with structures or pavement, there is an undeveloped area on the north side of the Airport that is

considered Farmland of Statewide Importance by the USDA-NRCS and the California Department of Conservation (USDA-NRCS 2015; CDC 2011). The AMP identifies this area as Future Non-Aviation Reserve and General Aviation (small aircraft) for the future development of non-aviation land uses and GA hangars. Therefore, potential impacts to designated farmland resources will need to be further evaluated in an EIR.

II b) No Impact. The Airport is not zoned for agriculture uses nor is it part of a Williamson Act contract. Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

II c-e) No Impact. There is no forest land or timberland (as defined in the Pub. Resources Code or Government Code) located at, or in proximity to, the Airport. Further evaluation of these issues in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
III. AIR QUALITY Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	X	☐	☐	☐
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	X	☐	☐	☐
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the air basin is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	X	☐	☐	☐
d) Expose sensitive receptors to substantial pollutant concentrations?	X	☐	☐	☐
e) Create objectionable odors affecting a substantial number of people?	X	☐	☐	☐

Impact Analysis

III a-e) Potentially Significant Impact. Monterey County is a designated "nonattainment" area for purposes of the ozone and PM_{10} (coarse dust particles 2.5 to 10 micrometers in diameter) California Ambient Air Quality Standards (CARB 2013). Implementation of the AMP would generate additional criteria air pollutant and toxic air contaminant emissions as a result of con-

struction and operational activities from a variety of emission sources. Thus, the project will need to be evaluated in relation to federal, state and regional air quality standards and plans in an EIR.

In addition, residential areas are located adjacent to the Airport in several areas and could be adversely affected by pollutant concentrations or odors related to individual AMP components. An EIR will include an air quality study to evaluate potential emissions from construction and operational activities, including ground transportation, as well as an evaluation of the proposed AMP's consistency with adopted air quality plans and policies.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
IV. BIOLOGICAL RESOURCES Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	X	☐	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service?	X	☐	☐	☐
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the *Clean Water Act* (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	X	☐	☐	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	X	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	X	☐	☐	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	X	☐

Impact Analysis

IV a-b) Potentially Significant Impact. Two federally-listed species (Monterey spineflower and Yadon's piperia) are located on the airport property; additionally, potential habitat for one federally-listed species (California red-legged frog) also is located on the property. The airport property also contains plant communities that are considered Communities of Concern by the CDFW, as well as other special-status species protected by the MBTA, the CFGC, and potentially the California *Endangered Species Act*. Riparian habitat may also present on the Airport at man-made ponds located on the north side of the Airport. Therefore, potential impacts to these resources will need to be further evaluated in an EIR.

IV c) Potentially Significant Impact. Man-made ponds located on the north side of the Airport are identified as wetlands by the USFWS National Wetland Inventory (2015). Two are identified as Freshwater Emergent Wetlands and one is identified as Freshwater Forested/Shrub Wetland. Therefore, potential impacts to these resources will need to be further evaluated in an EIR.

IV d) Less than Significant Impact. The Airport implements a Wildlife Hazard Management Plan (2013) to reduce potential hazards to aircraft and human safety associated with wildlife movements on and within the area encompassing 10,000 feet off the north and south sides of the Airport and five miles along the runway approaches per FAA AC 150/5200-33B, *Hazardous Wildlife Attractants On or Near Airports*. The proposed AMP will remain consistent with this Plan and will not create significant changes to the movement of wildlife across the Airport. Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

IV e) Potentially Significant Impact. Monterey County implements an Oak Protection Ordinance (Section 21.64.260); components of the AMP could conflict with this ordinance, if mitigation is not provided, since future development may require the removal of protected oaks. Therefore, potential impacts to these protected resources will need to be further evaluated in an EIR.

IV f) Less than Significant Impact. There are no adopted Habitat Conservation Plans (HCPs) or other types of resource management plans addressing sensitive biological resources at the Airport. The closest plan of this type is the administrative draft Fort Ord HCP, which addresses the conservation and enhancement of habitat for several special-status plants and animals known to occur on the former Fort Ord. At this time, MPAD is not a Cooperative Party to the agreement and the HCP has not been adopted. The plan will need to be approved by both the USFWS and CDFW prior to going into effect. Potential impacts to the HCP from implementation of the proposed AMP are less than significant. Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
V. CULTURAL RESOURCES Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in State CEQA Guidelines, Section 15064.5?	X	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to State CEQA Guidelines, Section 15064.5?	X	☐	☐	☐
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	X	☐	☐	☐
d) Disturb any human remains, including those interred outside of formal cemeteries?	X	☐	☐	☐
e) Would the project cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code, Section 21074?	X	☐	☐	☐

Impact Analysis

V a-e) Potentially Significant Impact. Cultural resources have been identified in the past on the airport property; and, additional historic, archaeological, or paleontological resources could be located on the property. In addition, there is the potential for human remains. Therefore, implementation of the proposed AMP could result in potential impacts to cultural resources that will need to be further evaluated in an EIR.

Tribal cultural resources include sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are listed on State or local historic registers or are otherwise significant per Public Resources Code, Section 21074. The potential for the proposed AMP to cause a substantial adverse change in the significance of tribal cultural resources will need to be further evaluated in an EIR.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
VI. GEOLOGY AND SOILS Would the project:				
a) Exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	X	☐	☐	☐
ii) Strong seismic ground shaking?	X	☐	☐	☐
iii) Seismic-related ground failure, including liquefaction?	X	☐	☐	☐
iv) Landslides?	X	☐	☐	☐
b) Result in substantial soil erosion or the loss of topsoil?	X	☐	☐	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	X	☐	☐	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	X	☐	☐	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	X	☐	☐	☐

Impact Analysis

VI a-d) Potentially Significant Impact. The Airport is not within a State-designated Alquist Priolo Earthquake Fault Zone nor is it within an area covered by the current State mapping for Liquefaction Hazard Zones (Cornerstone Earth Group 2009). However, although soil surveys and published geologic hazards maps provide some information about soils and geology in an area, these types of maps identify only generalized locations.

A preliminary geotechnical investigation at the Airport was performed for the recent Runway Safety Area Improvements Project. On a preliminary basis, it appears that fault rupture hazard and liquefaction has a low potential at the Airport. However, the geotechnical investigation identified a high potential for erosion, as well as a potential for static and seismic slope instability and landslides where loose soils occur. Expansive soils were not identified in the report (Cornerstone Earth Group 2009).

Onsite geologic and soil conditions at the Airport should be investigated further in an EIR.

VI e) Potentially Significant Impact. No septic tanks or alternative waste water disposal systems are proposed by the AMP other than the separation and reuse of grey water as a water conservation measure. However, since the details of this potential sustainability measure have not yet been evaluated, discussion of this issue in an EIR is required.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
VII. GREENHOUSE GAS EMISSIONS Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	X	☐	☐	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	X	☐	☐	☐

Impact Analysis

VII a-b) Potentially Significant Impact. Implementation of the AMP would generate additional greenhouse gas (GHG) emissions as a result of construction and operational activities. Thus, an EIR will include a GHG emissions study to evaluate the existing and future potential emissions from both construction and operational activities, including ground transportation. The EIR will also include an evaluation of the Project's consistency with applicable plans and policies for reducing GHG emissions.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
VIII. HAZARDS AND HAZARDOUS MATERIALS Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	X	☐	☐	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	X	☐	☐	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	X	☐	☐	☐
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code, Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	X	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	X	☐	☐	☐
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	X
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	X	☐	☐	☐
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☐	☐	X	☐

Impact Analysis

VIII a-b) Potentially Significant Impact. Implementation of the AMP would continue the aircraft operations and support services at the Airport. Activities involving the use of hazardous

materials at the Airport are associated with fueling, maintenance, and repair of aircraft and airport-related vehicles. The Airport also has a fuel farm and an ARFF facility, both of which also store and require the transport of hazardous materials. Some of the proposed AMP components involve the relocation or expansion of these facilities. Future development of non-aviation development may also potentially involve the use of hazardous substances. An EIR will address the potential risk to the public and the environment associated with the relocation, expansion, construction, and operation of facilities handling hazardous materials and appropriate mitigation for hazardous conditions will be recommended.

VIII c) Potentially Significant Impact. There is one preschool currently located within ¼ mile of the Airport within the City of Del Rey Oaks. Therefore, further evaluation of this issue in an EIR is required.

VIII d) Less than Significant Impact. There are no Superfund or Brownfield sites in proximity to the Airport; the closest such site is at Fort Ord (U.S. EPA 2015). In addition, the State's Cortese List indicates that there are no sites at the Airport on the State cleanup list (DTSC 2015). The Airport was a former military base and there are five remediated former USACE wells (2002) located on the northwestern area of the Airport. These wells are no longer contaminated and are being investigated by the Airport as a viable source of non-potable water to serve the Airport and other users (Allterra 2015). Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

VIII e) Potentially Significant Impact. The State of California requires that each airport and Airport Influence Area (AIA) be part of an Airport Land Use Compatibility Plan (ALUCP) (Caltrans 2011). MPAD currently has an approved (1987) *Comprehensive Land Use Plan for Monterey Peninsula Airport* (CLUP). Monterey County, as the ALUC, is in the process of updating that plan (i.e., an ALUCP). To the extent that safety-based compatibility zones change as a result of the AMP, the CLUP/ALUCP would need to be updated to reflect the new compatibility zones. The updated plan will provide guidance for future land uses within the AIA to ensure that public safety and airport compatibility is maintained.

In addition, the AMP would allow non-aviation land uses on the Airport, which would increase the number of people working in proximity to the Airport. Further evaluation of this issue in an EIR is required.

VIII f) No Impact. The Airport is a commercial airport and there are no private airstrips within ten nautical miles (AirNav.com 2015). Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

VIII g) Potentially Significant Impact. The Airport has an approved emergency response and evacuation plan (per 14 CFR Section 139.325) that addresses emergency procedures for all parts of the facility. This plan may need to be revised to incorporate the development components of the proposed AMP to ensure that they would not impair or interfere with implementa-

tion of the emergency evacuation plan related to the Airport. Further evaluation of this issue in an EIR is required.

VIII h) Less than Significant Impact. The Airport is not located within a fire hazard severity zone (FHSZ), as mapped by CAL FIRE (2008) and no change to the Airport's risk to wildland fires would occur as a result of the proposed AMP. Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
IX. HYDROLOGY AND WATER QUALITY Would the project:				
a) Violate any water quality standards or waste discharge requirements?	X	☐	☐	☐
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	X	☐	☐	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	X	☐	☐	☐
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	X	☐	☐	☐
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	X	☐	☐	☐
f) Otherwise substantially degrade water quality?	X	☐	☐	☐
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	☐	X

h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	☐	☐	☐	X
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☐	☐	☐	X
j) Inundation by seiche, tsunami, or mudflow?	☐	☐	☐	X

Impact Analysis

IX a, c-f) Potentially Significant Impact. The proposed AMP would relocate certain existing airport operations and would increase the amount of the Airport's impervious surfaces. This will change drainage patterns at the Airport as well as the Airport's potential to violate water quality standards or discharge requirements. Overall, aviation activity is expected to grow over the next 20 years, which could also increase water quality pollutants and runoff at the Airport despite continued regulatory compliance mechanisms. Although it is anticipated that continued application of the current water quality programs at the Airport would minimize potential pollutants (since the nature of the additional pollutants would be consistent with current operations), modifications to the Airport's stormwater drainage systems are likely to be necessary. An EIR will provide an evaluation of the anticipated changes in onsite drainage patterns and the types of pollutants occurring at the Airport, and will identify mitigation measures, as necessary.

IX b) Potentially Significant Impact. Water sources within central California have been impacted by the drought conditions experienced over the past several years. An EIR will be required to evaluate the potential change in water demand due to implementation of the AMP, to identify the sources of water, including groundwater, available to meet this demand, and to identify appropriate mitigation, as necessary.

IX g-j) No Impact. The only area of the Airport that is located within a mapped 100-year floodplain (Zone AO, Special Flood Hazard Areas Subject to Inundation by the 1% Annual Chance Flood) is the extreme southeastern corner of the Airport at the junction of Highways 68 and 218; other parts of the corner and along the Airport's eastern boundary with Del Rey Oaks could be inundated by a 100-year flood, but with average depths of less than one foot (Zone X, Other Flood Areas) (FEMA 2009). No changes to this area of the Airport, including the construction of housing or structures that could impede the flow of floodwaters, would occur as a result of the proposed AMP; the area is already developed primarily with commercial or light industrial land uses. The remainder of the Airport is located outside the mapped 500-year floodplain (Zone X, Other Areas) and is not subject to inundation due to seiches, tsunamis, or mudflows due to its location atop a plateau. Further evaluation of these issues in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
X. LAND USE AND PLANNING Would the project:				
a) Physically divide an established community?	☐	☐	X	☐
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	X	☐	☐	☐
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	☐	☐	X	☐

Impact Analysis

X a) Less than Significant Impact. Most components of the proposed AMP are located within the airport property boundaries. Potential property acquisition and/or avigation easements are proposed, however, for the Runway 28L and Runway 28R end RPZs. Avigation easements are recommended over existing light industrial and commercial development within the City of Del Rey Oaks along the west side of Highway 218, while property acquisition is recommended over undeveloped areas of the City of Monterey south of Highway 68 and northeast of Highway 218. FAA standards require that RPZs remain clear of development and, thus, no physical intrusion into the surrounding areas would occur.

Approximately 800 feet east of the Highway 68/Olmsted Road intersection is a 5.5-acre area of land that is also identified as potential property acquisition in the proposed AMP. The area is already surrounded by the Airport on three sides. Therefore, future development in this area would not physically divide an established community. Further evaluation of these issues in an EIR is not required, and no mitigation is necessary.

X b) Potentially Significant Impact. The Airport is subject to regional policies such as the Central Coast Region Basin Plan (Central Coast RWQCB 2011). An EIR will contain a summary of applicable regional plans and evaluate the proposed AMP's consistency with applicable policies. The proposed AMP also recommends a north side access road that would require a connection with Del Rey Garden Road in the City of Del Rey Oaks. Therefore, an EIR will address potential inconsistencies with City of Del Rey Oaks General Plan policies.

In addition, although the Airport is located within a Special District (i.e., MPAD) and is not generally subject to the policies and land use plans of the surrounding or adjacent local jurisdic-

tions (i.e., the City of Del Rey Oaks, the City of Monterey, or Monterey County), in the interest of being a "good neighbor" and to aid in properly mitigating potential environmental or land use compatibility impacts related to the Airport, certain policies of these jurisdictions are considered during the planning and evaluating of development projects at the Airport. (For example, the Monterey County Oak Protection Ordinance is typically used by MPAD to identify mitigation for oak tree removal at the Airport. Another example would be Level of Service thresholds for local and regional roadways.) Therefore, to the extent that local policies provide appropriate thresholds or mitigation for environmental impacts or land use conflicts with adjacent jurisdictions, an EIR will address the proposed AMP's consistency with these policies as well.

X c) Less than Significant Impact. There are no adopted HCPs or other types of resource management plans addressing sensitive biological resources at the Airport. The closest plan of this type is the administrative draft Fort Ord HCP, which addresses the conservation and enhancement of habitat for several special-status plants and animals known to occur on the former Fort Ord. At this time, MPAD is not a Cooperative Party to the agreement and the HCP has not been adopted. The plan will need to be approved by both the USFWS and the CDFW prior to going into effect. Potential impacts to the HCP from implementation of the proposed AMP are less than significant. Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XI. MINERAL RESOURCES Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	X
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	X

Impact Analysis

XI a-b) No Impact. No mineral extraction occurs on the airport property nor is the Airport identified as an area of "Identified Mineral Resource Significance" within the Monterey County General Plan (Monterey County 2008). Therefore, further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XII. NOISE Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	X	☐	☐	☐
b) Exposure of persons to or generation of excessive ground borne vibration or ground borne noise levels?	X	☐	☐	☐
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	X	☐	☐	☐
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	X	☐	☐	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	X	☐	X	☐
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	X

Impact Analysis

XII a-d) Potentially Significant Impact. According to 14 CFR 150, residential land uses and schools are not considered compatible with a 65 Day-Night Average Sound Level (DNL) (or Community Noise Equivalent Level [CNEL]) contour or higher.[11] Religious facilities, hospitals, or nursing homes located within a 65 DNL (or CNEL) contour are generally compatible if an interior noise level reduction of 25 decibel (dB) is incorporated into the design and construction of the structure.

The Airport's existing (2013) CNEL noise contours were modeled as part of the AMP process. Based on this information, the Airport's 65 CNEL noise contour extends off the Airport at both

[11] In California, CNEL is used in place of DNL. DNL accounts for the increased sensitivity to noise at night (10:00 p.m. to 7:00 a.m.) and is the metric preferred by FAA, U.S. Environmental Protection Agency (EPA), and U.S. Department of Housing and Urban Development (HUD) as an appropriate measure of cumulative noise exposure. In California, however, these agencies accept the use of CNEL which, in addition to nighttime sensitivities, also accounts for increased sensitivities during the evening hours (7:00 p.m. to 10:00 p.m.).

the west and east ends of the runway; the 70 CNEL noise contour is slightly off airport property to the southeast of Runway 28L end and northwest at the Runway 10R end. On the east end, the 65 CNEL contour is located over vegetated open space to the southeast and over an industrial/office complex to the northeast. None of the sensitive noise-receptors discussed above are present on the east end.

To the west, the 65 CNEL contour extends over several residential properties. Most of these homes have received sound insulation measures such as the installation of central air conditioning, improved insulation, and/or double-glazed windows from a previous sound insulation program. Those residences that did not receive sound insulation were eligible, but did not participate in the program. No sensitive noise receptors are affected by the existing 70 CNEL.

Based on future (2033) CNEL contours that would occur due to the proposed AMP implementation, future noise impacts to sensitive noise-receptors may change slightly. In addition, during the construction of various AMP components, noise and/or vibration due to construction activities and traffic may occur. Therefore, an EIR will address these issues further and identify mitigation, as appropriate.

XII e) Potentially Significant Impact. The State of California requires that each airport and AIA be part of an ALUCP (Caltrans 2011). MPAD currently has an approved 1987 *Comprehensive Land Use Plan for Monterey Peninsula Airport* (CLUP). The ALUC is in the process of updating that plan (i.e., an ALUCP). To the extent that noise-based compatibility zones change as a result of the AMP, the CLUP/ALUCP would need to be updated to reflect the new compatibility zones. The updated plan will provide guidance for future land uses within the AIA to ensure that public is not exposed to excessive noise.

In addition, the AMP would allow additional non-aviation land uses on the Airport, which would increase the number of people working in proximity to potentially excessive noise levels. Further evaluation of this issue in an EIR is required.

XII f) No Impact. The Airport is a commercial airport and there are no private airstrips within ten nautical miles (AirNav.com 2015). Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XIII. POPULATION AND HOUSING Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	X	☐	☐	☐
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	X
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	X

Impact Analysis

XIII a) Potentially Significant Impact. The FAA-approved forecasts for the Airport over the AMP's 20-year planning horizon anticipate an annual average growth rate in enplanements of 1.59 percent and an annual average growth rate in total operations of 2.04 percent. One additional access road to the north side of the Airport also is recommended in the intermediate-term planning scenario if additional development that would generate substantial new traffic is constructed. Increasing accessibility to the region, through additional enplanements and roadway improvements, may indirectly affect population growth in the region. Therefore, further evaluation of this issue in an EIR is required.

Relatedly, an EIR also is required to address the potential growth inducement effects of a project.

XIII b, c) No Impact. Implementation of the proposed AMP would not displace existing housing or people. Further evaluation of this issue in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XIV. PUBLIC SERVICES Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services**:**				
a) Fire protection?	X	☐	☐	☐
b) Police protection?	X	☐	☐	☐
c) Schools?	☐	☐	☐	X
d) Parks?	☐	☐	☐	X
e) Other public facilities?	☐	☐	☐	X

Impact Analysis

XIV a) Potentially Significant Impact. The anticipated increase in total airport operations and the development of additional aviation and non-aviation land uses over the next 20 years would result in an incremental increase in demand for fire protection. The Airport has its own ARFF building that handles fire protection on the facility as well as providing structural response units for off-airport needs; the ARFF is staffed by City of Monterey employees. One of the components in the proposed AMP is to relocate the existing ARFF building and to upgrade it to modern design standards. Two options are being considered, both of which would be located within an area of the Airport that is already developed. Further evaluation of this issue in an EIR is required.

XIV b) Potentially Significant Impact. The anticipated increase in total airport operations and the development of aviation and non-aviation land uses over the next 20 years would result in an incremental increase in demand for police protection. Police protection at the Airport is provided by MPAD and is based at the Airport. Further evaluation of this issue in an EIR is required.

XIV c-e) No Impact. The proposed AMP would not result in the development of any residential units or generate additional residents or students, nor would it create an increased demand on schools, parks, or other public facilities. Further evaluation of these issues in an EIR is not required, and no mitigation is necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XV. RECREATION				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	X	☐	☐	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	X	☐	☐	☐

Impact Analysis

XV a-b) Potentially Significant Impact. Increased aviation activity at the Airport could create an increased demand on parks or other recreational facilities by increasing tourism activity in the region. Further evaluation of these issues in an EIR is required.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XVI. TRANSPORTATION/TRAFFIC Would the project:				
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	X	☐	☐	☐
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	X	☐	☐	☐
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	X	☐	☐	☐

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	X	☐	☐	☐
e) Result in inadequate emergency access?	X	☐	☐	☐
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	X	☐	☐	☐

Impact Analysis

XVI a, b, f) Potentially Significant Impact. Implementation of the proposed AMP would result in additional airport-related traffic as well as physical improvements and other changes to the existing circulation system. All aspects of the proposed AMP will be addressed in a project-specific traffic impact analysis. Consistency with transportation policies of adopted regional transportation plans will also be considered. Therefore, an EIR will incorporate the findings of the traffic impact and policy analyses and identify mitigation, as appropriate.

XVI c) Potentially Significant Impact. Air traffic patterns around the Airport are established by the FAA and are not under the control of MPAD. Thus, implementation of the proposed AMP would have no effect on the location of current or future air traffic patterns in the region.

Takeoff or approach flight tracks are also dictated by considerations of operational safety and air traffic control procedures. The FAA sets minimum requirements for departure procedures; these procedures cannot be implemented or modified without concurrence of the FAA, taking into account operational, safety, and airspace considerations.

With respect to the air traffic levels at the Airport, the number of aircraft operations which can be accommodated at a given airport in any hour or day is controlled primarily by such factors as weather conditions, airline schedules, and market conditions. Other, more attenuated and less direct factors, can include such matters as the size of the airline and airport support facilities, and the physical configuration of the airfield.

Airline scheduling is the principal factor affecting how many times planes land and take off during a given hour. At Monterey, as with most airports, there are a number of peak periods each day. Airline scheduling usually seeks to accommodate the needs and travelling preferences of the air travelling public. The number of commercial flights which occur at the Airport is determined primarily by market demand. These marketing factors would be unaffected by the proposed AMP.

Particularly since adoption of the *Airline Deregulation Act of 1978*, market conditions and scheduling efficiencies have been the principal considerations for airlines contemplating increased or decreased service at any airport, including Monterey. The proposed AMP, there-

fore, would not be a factor of significance to the possible decision of any airline to increase or decrease service at the Airport. Therefore, implementation of the proposed AMP would result from expected growth in demand for air service at the Airport which is unrelated to, and not influenced by, implementation of the proposed AMP.

Also, at an airport there are a number of considerations which determine the airport's hourly capacity. For obvious safety reasons, the FAA requires air traffic controllers to space aircraft appropriately to avoid conflicts on a runway. Similarly, a plane cannot cross a given runway when another plane is landing or taking off on that same runway. Because the proposed AMP is not proposing major changes to the airfield configuration, hourly capacity at the Airport will not change as a result of the proposed project.

That said, and to some degree, the size of support facilities can influence the number of planes an airport can accommodate at any one time. Therefore, arguably, the proposed AMP could possibly accommodate an increase in air traffic levels at any one time through the provision of additional aeronautical and non-aeronautical facilities and amenities at the Airport. Therefore, an evaluation of whether any possible increase in air traffic levels would result in substantial safety risks is required in an EIR.

XVI d, e) Potentially Significant Impact. Public roadway and access improvements are included as components of the proposed AMP. These features would be designed to meet applicable local and State standards for roadway improvements and would require approval from the appropriate City, County, or State traffic engineer. Items such as site distance, emergency access, and grade standards would be enforced by the approving agency. An EIR will evaluate the preliminary design of the roadway improvements and include mitigation measures, as necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XVII. UTILITIES AND SERVICE SYSTEMS Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	X	☐	☐	☐
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	X	☐	☐	☐
c) Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	X	☐	☐	☐

d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	X	☐	☐	☐
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	X	☐	☐	☐
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	X	☐	☐	☐
g) Comply with federal, state, and local statutes and regulations related to solid waste?	X	☐	☐	☐

Impact Analysis

XVII a-e) Potentially Significant Impact. Implementation of the proposed AMP would involve additional buildings that would require both water and sanitary sewer service. Additional landscaping would also require additional water. As previously discussed under Section IX b, water sources within central California have been impacted by the drought conditions experienced over the past several years. Therefore, any changes in water demand, sewer service and stormwater drainage facilities would need to be evaluated (see also Section IX a, c-f).

California American Water Company (CalAm) provides water service to most of the Airport, although a few tenants including the Airport own their own wells. Monterey Peninsula Water Management District (MPWMD) is charged with allocating water within the Monterey peninsula region and permitting the use of water credits for each jurisdiction/district, including the Airport. Sanitary sewer service is provided by the City of Monterey, which participates in a regional wastewater treatment plant. An EIR will be required to evaluate the potential change in water, water allocation, and sewer service, as well as water, sewer, and drainage infrastructure due to implementation of the AMP and to identify mitigation, as appropriate.

XVII f-g) Potentially Significant Impact. Solid waste disposal for the Monterey area is managed by the Monterey Regional Waste Management District (MRWMD) and disposed of at the Monterey Peninsula Landfill. The Solid Waste Facility Permit for the District operation states that the peak tonnage of incoming waste shall not exceed 3,500 tons per day. The landfill currently receives less than 1,000 tons per day of municipal solid waste for disposal. The remaining landfill waste capacity is approximately 71 million cubic yards (cy) and is projected to reach its full capacity in the year 2161 (MRWMD 2015). Construction of a new 23-acre lined landfill module was completed in June 2013 on the 70–acre MRWMD site. This lined landfill module has a waste capacity of approximately 5,000,000 tons and a service life of approximately 17 years (MRWMD 2015). The California Integrated Waste Management Act of 1989 (Assembly Bill [AB] 939) required all counties to prepare a County Integrated Waste Management Plan. In Monte-

rey County, the Monterey Regional Waste Management District coordinates the County's reuse and recycling efforts.

Implementation of the Airport would result in potentially more solid waste that currently occurs. The Airport implements a trash recycling program; in addition, the proposed AMP includes a Sustainability Action Plan (refer to **Table 5**). One of these measures (No. 19) is to develop and implement an Integrated Solid Waste Management Plan. Both the existing airport recycling program and the future Integrated Solid Waste Management Plan would reduce impacts of the Airport on regional solid waste disposal. An EIR will address the Project's solid waste generation and identify mitigation measures, as necessary.

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
XVIII. MANDATORY FINDING OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	X	☐	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	X	☐	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	X	☐	☐	☐

Impact Analysis

XVIII a) Potentially Significant Impact. As discussed in this Initial Study, components of the proposed AMP might have potentially significant impacts on agriculture (Farmland of Statewide Importance) and biological, cultural, visual and water resources located at the Airport. Therefore, potential impacts to these resources will be further evaluated in an EIR.

XVIII b) Potentially Significant Impact. Potentially considerable cumulative impacts on the environment may occur to various environmental resource categories. Because the AMP's contribution to cumulative impacts is not completely known at this time, incremental impacts based on the AMP will be further evaluated in an EIR.

XVIII c) Potentially Significant Impact. As discussed in this Initial Study, potentially substantial adverse effects on humans (direct or indirect) could occur as a result of the AMP in the following categories: aesthetics, air quality, geology and soils, greenhouse gases, hazards and hazardous materials, hydrology/water quality, land use and planning, noise, public services, recreation, transportation/traffic, and utilities and service systems. Therefore, potential impacts related to these categories will be further evaluated in an EIR.

Subject: NOP EIR IS Airport Master Plan

Hello,

Could the Master Plan address the issue of jet fumes being conveyed up to the 2211 Garden Road building. The jet engine maintenance people and or jet parking areas result if exhaust fumes entering our building and the fumes are so overwhelming and smell so bad that we almost have to evacuate the building. If jets can park in a manner that blows the exhaust fumes away from the 2211 Garden Road business complex that would be preferred. Some staff get major headaches and have to leave the office for the day when this occurs.

If a jet engine maintenance/mechanic business is in close proximity to our row of business buildings can they be notified that the exhaust is an issue and to please not rev the engines for so long as they come into our building.

Thank you.

Re: CA-MNT-728 - Notice of Preparation for an Environmental Impact Report and Notice of Scoping Meeting, and Initial Study for the proposed Monterey Regional Airport - Airport Master Plan Project -

Saleki Atsa,

Ohlone/Costanoan-Esselen Nation is an historically documented previously recognized tribe. OCEN is the legal tribal government representative for over 600 enrolled members of Esselen, Carmeleno, Monterey Band, Rumsen, Chalon, Soledad Mission, San Carlos Mission and/or Costanoan Mission Indian descent. Though other indigenous people may have lived in the area, the area is the indigenous homeland of our people. Included with this letter please find a territorial map by Taylor 1856; Levy 1973; and Milliken 1990, indentifying Tribal areas.

Ohlone/Costanoan-Esselen Nation objects to all excavation in known cultural lands, even when they are described as previously disturbed, and of no significant archaeological value. Please be advised that it is our first priority that our ancestor's remains be protected and undisturbed. We desire that all cultural and sacred burial items be left with our ancestors on site or where they are discovered. We ask for the respect that is afforded all of our current day deceased, by no other word these burial sites are cemeteries, respect for our ancestors as you would expect respect for your deceased family members in today's cemeteries. **Our definition of respect is no disturbance.**

I was assigned as the Most Likely Descendant for CA-MNT-728, by the Native American Heritage Commission, we continue to wait for follow through to rebury the remains of our Ancestors found on site. There has been no contact as to the return of artifacts found on CA-MNT-728 as agreed by the airport management. I have noticed with this report that there is a change in management and would like to establish a meeting to discuss these items as well as current *Potentially Significant Impact as reported in the "INITIAL STUDY FOR THE MONTEREY REGIONAL AIRPORT MASTER PLAN"* prepared by Coffman Associates, Inc. 4835 E. Cactus Road, suite 235 Scottsdale, AZ 85254 page 32, Cultural Resources.

OCEN's Tribal leadership desires to be provided with reports, surveys, including subsurface testing, and presence/absence testing. OCEN request to be included in mitigation and recovery programs, reburial of any of our ancestral remains, placement of all cultural items, and that a Native American Monitor of Ohlone/Costanoan-Esselen Nation, approved by the OCEN Tribal Council be used within our aboriginal territory.

We request consultation on projects affecting our aboriginal homelands. We look forward to hearing more information about this project; please feel free to contact me at (408) 629-5189. Nimasianexelpasaleki. Thank you for your attention to this matter.

Sincerely and Respectfully Yours,

Louise J. Miranda Ramirez, Chairperson
Ohlone/Costanoan-Esselen Nation

December 2015

Issues	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
V. CULTURAL RESOURCES				
Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in State CEQA Guidelines, Section 15064.5?	X	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to State CEQA Guidelines, Section 15064.5?	X	☐	☐	☐
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	X	☐	☐	☐
d) Disturb any human remains, including those interred outside of formal cemeteries?	X	☐	☐	☐
e) Would the project cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code, Section 21074?	X	☐	☐	☐

Impact Analysis

V a-e) Potentially Significant Impact. Cultural resources have been identified in the past on the airport property; and, additional historic, archaeological, or paleontological resources could be located on the property. In addition, there is the potential for human remains. Therefore, implementation of the proposed AMP could result in potential impacts to cultural resources that will need to be further evaluated in an EIR.

Tribal cultural resources include sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are listed on State or local historic registers or are otherwise significant per Public Resources Code, Section 21074. The potential for the proposed AMP to cause a substantial adverse change in the significance of tribal cultural resources will need to be further evaluated in an EIR.

RE: Notice of Preparation of an Environmental Impact Report & Notice of Scoping Meeting; Initial Study; Proposed Monterey Regional Airport – Airport Master Plan at Monterey Regional Airport in Monterey, California

Dear Ms. Ramirez:

Please review the enclosed ***Notice of Preparation for an Environmental Impact Report & Notice of Scoping Meeting,*** and ***Initial Study*** for the proposed ***Monterey Regional Airport – Airport Master Plan Project ("Project").***

Pursuant to Section 15082 of the State California Environmental Quality Act ("CEQA") Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq.), the Monterey Peninsula Airport District ("District"), acting in its capacity as the owner and operator of Monterey Regional Airport, has determined that an Environmental Impact Report ("EIR") is the appropriate environmental document for the Project. The District will be the Lead Agency for the Project and will be responsible for the EIR preparation pursuant to CEQA and the State CEQA Guidelines.

Coordination with all responsible agencies will be provided in accordance with the Notice of Preparation statutes. Additionally, the Scoping Meeting will be held from 2:00PM-4:00PM at the 2nd Floor of the Airport Terminal Building- 200 Fred Kane Drive, Suite 200, Monterey, CA 93940 on Wednesday, February 3, 2016.

Please send any written comments or concerns regarding potential environmental impacts of the proposed Project addressed to me at: 200 Fred Kane Drive Suite 200, Monterey, CA 93940 or via email at sglennon@montereyairport.com by **Tuesday, February 16, 2015**. If you have any questions or need additional information, please feel free to contact me at (831) 648-7000 Ext. 209. Thank you for your consideration and timely response.

Sincerely,

Shelley Glennon
Planning Manager - Environmental

Enclosure

EXECUTIVE STAFF **Michael La Pier, AAE** | Executive Director **Scott Huber** | District Counsel

NOTICE OF PREPARATION AND NOTICE OF SCOPING MEETING

DATE: December 28, 2015
SUBJECT: Notice of Preparation of an Environmental Impact Report and Notice of Scoping Meeting
PROJECT TITLE: Monterey Regional Airport – Airport Master Plan
APPLICANT: Monterey Peninsula Airport District
200 Fred Kane Drive
Monterey, California 93940

Notice is hereby given pursuant to Section 15082 of the State California Environmental Quality Act ("CEQA") Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq.), that the Monterey Peninsula Airport District ("District"), acting in its capacity as the owner and operator of Monterey Regional Airport, has determined that an Environmental Impact Report ("EIR") is the appropriate environmental document for the Monterey Regional Airport Master Plan Project ("Project"). The District will be the Lead Agency for the Project and will be responsible for the EIR preparation pursuant to CEQA and the State CEQA Guidelines. The Project description, location, and an analysis of the probable environmental effects of the proposed project are contained in the attached materials.

As required by Section 15082 of the CEQA Guidelines, this Notice of Preparation ("NOP") has been prepared and distributed to solicit comments from potential Responsible and Trustee Agencies on Project-related concerns relevant to each agency's statutory responsibilities. Comments on the content and scope of the EIR also are solicited from any other interested parties (including other agencies and affected members of the public). The EIR will be the environmental document of reference for Responsible and Trustee Agencies when considering subsequent discretionary approvals.

The District requests that any potential Responsible or Trustee Agencies responding to this NOP reply in a manner consistent with Section 15082(b) of the State CEQA Guidelines, which allows for the submittal of any comments in response to this notice no later than 45 days after receipt of the NOP. The District will accept comments from these Agencies and others regarding this NOP through the close of business, February 16, 2016.

This NOP is available for viewing at www.montereyairport.com. In addition, a Scoping Meeting will be held from 2:00PM-4:00PM at the following location: 2nd Floor of the Airport Terminal Building 200 Fred Kane Drive, Suite 200, Monterey, CA 93940 on Wednesday, February 3, 2016.

Your agency and other interested parties are invited to attend and submit comments for consideration during preparation of the EIR. All comments and responses to this NOP must be submitted in writing to:

Subject: re: NOP Airport Master Plan

Dear Ms. Glennon,

Attached below please find a letter previously sent to MRA consultant Jim Harris of Coffman Associates.

Portions of this letter are pertinent to a proposed new Airport Master Plan. Please include this letter as part of your scoping.

On behalf of the Highway 68 Coalition I ask that these be issues be included:

Because the new Draft Final Monterey Regional Airport Master Plan is currently proposing/estimating a 2% yearly growth rate of air traffic over the next twenty years, the issues of noise, pollution including greenhouse gases, neighborhood safety, flight paths, and possible continuing newer flight paths, need to be carefully analyzed for their cumulative impacts. There is a direct nexus between these issues and a new Airport Master Plan and new Airport Layout Plan.

1) On behalf of The Highway 68 Coalition, I ask that the above does become part of the necessary environmental analysis in the NEPA and CEQA documents to be prepared.

Page 2

2) I request to be put on the notification list, advising me of all Monterey Regional Airport hearing dates and comment and filing deadlines regarding a new Airport Master Plan and Airport Layout Plan(s) environmental analysis documents. Please include dates and times of any and all Scoping Hearings. If you are not the point of

contact, please advise me of who will be.

3) I request that a late night airline curfew or a voluntary curfew be implemented as part of the new Master Plan process. This does not mean emergencies. These are for regular scheduled flights. At one time the curfew was 9 p.m. at the Monterey Airport. This issue came up at a previous PAC meeting.
.....

Also, please do include CalTrans, District 5 staff, in analysis of the Mater Plans effects on the designated Scenic Highway as well as cumulative traffic impacts to Highways 68 and 218 as well as surrounding roadways.

Thank you for your consideration,

Mike Weaver
Chair, The Highway 68 Coalition

Re: Monterey Regional Airport, Proposed 2015 Airport Master Plan and Airport Layout Plan.
PAC member Mike Weaver's comments following the additional Monterey Regional Airport's Planning Advisory Committee meeting of September, 29, 2015, 2:00 p.m.
Monterey Regional Airport Boardroom

October 1, 2015

Dear Mr. Harris,

The issues of new Monterey Regional Airport flight paths, noise, and safety, came up at yesterday's PAC meeting. These are issues that not only affect neighbors of the Monterey Airport. In a copy of a letter I received from a neighbor, sent by U.S. Congressman Sam Farr's office, I learned the following:

* The FAA has created a NextGen air traffic control modernization program.

* Much air traffic is being rerouted to new flight paths, crossing neighborhoods previously not experiencing significant commercial over-flights.

* The FAA's SERFR ONE is impacting neighboring Santa Cruz County's quality of life and property values. The new flight paths in and out of Monterey Regional Airport are similarly affecting neighbors here.

* These issues are currently being looked into by some of the highest levels of the FAA and elected representatives in our Federal Government, with hopes to be able to resolve them.

Because the new Draft Final Monterey Regional Airport Master Plan is currently proposing/estimating a 2% yearly growth rate of air traffic over the next twenty years, the issues of noise, pollution including greenhouse gases, neighborhood safety, flight paths, and possible continuing newer flight paths, need to be carefully analyzed for their cumulative impacts. There is a direct nexus between these issues and a new Airport Master Plan and new Airport Layout Plan.

1) On behalf of The Highway 68 Coalition, I ask that the above does become part of the necessary environmental analysis in the NEPA and CEQA documents to be prepared.

2) I request to be put on the notification list, advising me of all Monterey Regional Airport hearing dates and comment and filing deadlines regarding a new Airport Master Plan and Airport Layout Plan(s) environmental analysis documents. Please include dates and times of any and all Scoping Hearings. If you are not the point of contact, please advise me of who will be.

3) I request that a late night airline curfew or a voluntary curfew be implemented as part of the new Master Plan process. This does not mean emergencies. These are for regular scheduled flights. At one time the curfew was 9 p.m. at the Monterey Airport. This issue came up at a previous PAC meeting.

4) May I please have the courtesy of responses to questions the Highway 68 Coalition asked in the letter sent to you dated July 20, 2015?

On another note, the Districts eliminating consideration of new automobile/truck traffic access points on California State Route 68 is much appreciated. The highway operational integrity, safety, and aesthetics all benefit from this decision.

Finally, thank you very much for being the facilitator at the Monterey Regional Airport's PAC meetings.

Sincerely,

Mike Weaver
Chair, The Highway 68 Coalition

DEPARTMENT OF THE ARMY
SAN FRANCISCO DISTRICT, U.S. ARMY CORPS OF ENGINEERS
1455 MARKET STREET
SAN FRANCISCO, CALIFORNIA 94103-1398

JAN 26 2016

Regulatory Division

SUBJECT: File Number 2016-00023S

Ms. Shelley Glennon
Planning & Development Department
Monterey Peninsula Airport District
200 Fred Kane Drive, Suite 200
Monterey, CA 93940

Dear Ms. Glennon:

This letter is written in response to a request for comments on the "Notice of Preparation for an Environmental Impact Report & Notice of Scoping Meeting" and "Initial Study" concerning the proposed "Monterey Regional Airport – Airport Master Plan Project" as described in the notice from the Monterey Peninsula Airport District dated December 28, 2015. Your project is located near freshwater wetlands at Monterey Regional Airport in the City of Monterey, Monterey County, California. Since this activity may involve the discharge of fill into wetlands and, therefore, impact a water of the U.S., the Corps of Engineers will need to review those portions of your project.

All proposed work and/or structures extending bayward or seaward of the line on shore reached by mean high water (MHW) in tidal waters, or ordinary high water in non-tidal waters designated as navigable waters of the United States, must be authorized by the Corps of Engineers pursuant to Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. Section 403). Additionally, all work and structures proposed in unfilled portions of the interior of diked areas below former MHW must be authorized under Section 10 of the same statute.

All proposed discharges of dredged or fill material into waters of the United States must be authorized by the Corps of Engineers pursuant to Section 404 of the Clean Water Act (CWA) (33 U.S.C. Section 1344). Waters of the United States generally include tidal waters, lakes, ponds, rivers, streams (including intermittent streams), and wetlands.

Your proposed work appears to be within our jurisdiction and a permit may be required for your project. Application for Corps authorization should be made to this office using the application form in the enclosed pamphlet. To avoid delays it is essential that you enter the File Number at the top of this letter into Item No. 1 of the application. The application must include plans showing the location, extent and character of the proposed activity, prepared in accordance with the requirements contained in this pamphlet. You should note, in planning your project,

that upon receipt of a properly completed application and plans, it may be necessary to advertise the proposed work by issuing a Public Notice for a period of 30 days.

If an Individual Permit may be required, it will be necessary for you to demonstrate to the Corps that your proposed fill is necessary because there are no practicable alternatives, as outlined in the U.S. Environmental Protection Agency's Section 404(b)(1) Guidelines. A copy is enclosed to aid you in preparation of this alternative analysis. You are advised to refrain from starting your proposed activity until we complete our review of your application and issue you the required authorization.

Commencement of work before you receive our notification will be interpreted as a violation of our regulations.

The Corps regulatory program supports the national goal of "no overall net loss" of wetlands. For permitted activities that result in unavoidable losses, the Corps requires replacement wetlands to offset those losses. The U.S. Army Corps of Engineers and U.S. Environmental Protection Agency released a new Compensatory Mitigation Rule on April 10, 2008, to clarify how to provide compensatory mitigation for unavoidable impacts to the nation's wetlands and streams. A copy of this rule can be found on our Headquarters website: http://www.usace.army.mil/Missions/CivilWorks/RegulatoryProgramandPermits/mitig_info.aspx The new rule changes where and how mitigation is to be completed, but maintains existing requirements on when mitigation is required. The rule also preserves the requirement for applicants to avoid or minimize impacts to aquatic resources before proposing compensatory mitigation projects to offset permitted impacts. Regulatory Guidance Letter 08-03 in the enclosed pamphlet provides guidance on minimum monitoring requirements for compensatory mitigation projects, including the required minimum content for monitoring reports.

The Corps of Engineers receives thousands of requests each year to perform wetland delineations for potential applicants for permits under Section 404 of the Clean Water Act. Due to limited staff and resources, response time can be several months or longer. To expedite this process, the San Francisco District encourages applicants to use consultants to conduct wetland delineations, especially for large and/or complex areas. The San Francisco District is not authorized to recommend any private consulting services and advises applicants to check references and referrals of prospective consultants before contracting services.

You may refer any questions on this matter to Naomi Schowalter of my Regulatory staff by telephone at 415-503-6763 or by e-mail at naomi.a.schowalter@usace.army.mil. All correspondence should be addressed to the Regulatory Division, South Branch, referencing the file number at the head of this letter.

Sincerely,

Katerina Galacatos
for Tori White
Acting Chief, Regulatory Division

Enclosures

U.S. ARMY CORPS OF ENGINEERS **APPLICATION FOR DEPARTMENT OF THE ARMY PERMIT** 33 CFR 325. The proponent agency is CECW-CO-R.	***Form Approved -*** ***OMB No. 0710-0003*** ***Expires: 30-SEPTEMBER-2015***

Public reporting for this collection of information is estimated to average 11 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of the collection of information, including suggestions for reducing this burden, to Department of Defense, Washington Headquarters, Executive Services and Communications Directorate, Information Management Division and to the Office of Management and Budget, Paperwork Reduction Project (0710-0003). Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. Please DO NOT RETURN your form to either of those addresses. Completed applications must be submitted to the District Engineer having jurisdiction over the location of the proposed activity.

PRIVACY ACT STATEMENT

Authorities: Rivers and Harbors Act, Section 10, 33 USC 403; Clean Water Act, Section 404, 33 USC 1344; Marine Protection, Research, and Sanctuaries Act, Section 103, 33 USC 1413; Regulatory Programs of the Corps of Engineers; Final Rule 33 CFR 320-332. Principal Purpose: Information provided on this form will be used in evaluating the application for a permit. Routine Uses: This information may be shared with the Department of Justice and other federal, state, and local government agencies, and the public and may be made available as part of a public notice as required by Federal law. Submission of requested information is voluntary, however, if information is not provided the permit application cannot be evaluated nor can a permit be issued. One set of original drawings or good reproducible copies which show the location and character of the proposed activity must be attached to this application (see sample drawings and/or instructions) and be submitted to the District Engineer having jurisdiction over the location of the proposed activity. An application that is not completed in full will be returned.

26. List of Other Certificates or Approvals/Denials received from other Federal, State, or Local Agencies for Work Described in This Application.

AGENCY	TYPE APPROVAL*	IDENTIFICATION NUMBER	DATE APPLIED	DATE APPROVED	DATE DENIED

* Would include but is not restricted to zoning, building, and flood plain permits

27. Application is hereby made for permit or permits to authorize the work described in this application. I certify that this information in this application is complete and accurate. I further certify that I possess the authority to undertake the work described herein or am acting as the duly authorized agent of the applicant.

SIGNATURE OF APPLICANT DATE SIGNATURE OF AGENT DATE

The Application must be signed by the person who desires to undertake the proposed activity (applicant) or it may be signed by a duly authorized agent if the statement in block 11 has been filled out and signed.

18 U.S.C. Section 1001 provides that: Whoever, in any manner within the jurisdiction of any department or agency of the United States knowingly and willfully falsifies, conceals, or covers up any trick, scheme, or disguises a material fact or makes any false, fictitious or fraudulent statements or representations or makes or uses any false writing or document knowing same to contain any false, fictitious or fraudulent statements or entry, shall be fined not more than $10,000 or imprisoned not more than five years or both.

Instructions for Preparing a
Department of the Army Permit Application

Blocks 1 through 4. To be completed by Corps of Engineers.

Block 5. Applicant's Name. Enter the name and the E-mail address of the responsible party or parties. If the responsible party is an agency, company, corporation, or other organization, indicate the name of the organization and responsible officer and title. If more than one party is associated with the application, please attach a sheet with the necessary information marked Block 5.

Block 6. Address of Applicant. Please provide the full address of the party or parties responsible for the application. If more space is needed, attach an extra sheet of paper marked Block 6.

Block 7. Applicant Telephone Number(s). Please provide the number where you can usually be reached during normal business hours.

Blocks 8 through 11. To be completed, if you choose to have an agent.

Block 8. Authorized Agent's Name and Title. Indicate name of individual or agency, designated by you, to represent you in this process. An agent can be an attorney, builder, contractor, engineer, or any other person or organization. Note: An agent is not required.

Blocks 9 and 10. Agent's Address and Telephone Number. Please provide the complete mailing address of the agent, along with the telephone number where he / she can be reached during normal business hours.

Block 11. Statement of Authorization. To be completed by applicant, if an agent is to be employed.

Block 12. Proposed Project Name or Title. Please provide name identifying the proposed project, e.g., Landmark Plaza, Burned Hills Subdivision, or Edsall Commercial Center.

Block 13. Name of Waterbody. Please provide the name of any stream, lake, marsh, or other waterway to be directly impacted by the activity. If it is a minor (no name) stream, identify the waterbody the minor stream enters.

Block 14. Proposed Project Street Address. If the proposed project is located at a site having a street address (not a box number), please enter it here.

Block 15. Location of Proposed Project. Enter the latitude and longitude of where the proposed project is located. If more space is required, please attach a sheet with the necessary information marked Block 15.

Block 16. Other Location Descriptions. If available, provide the Tax Parcel Identification number of the site, Section, Township, and Range of the site (if known), and / or local Municipality that the site is located in.

Block 17. Directions to the Site. Provide directions to the site from a known location or landmark. Include highway and street numbers as well as names. Also provide distances from known locations and any other information that would assist in locating the site. You may also provide description of the proposed project location, such as lot numbers, tract numbers, or you may choose to locate the proposed project site from a known point (such as the right descending bank of Smith Creek, one mile downstream from the Highway 14 bridge). If a large river or stream, include the river mile of the proposed project site if known

Block 18. Nature of Activity. Describe the overall activity or project. Give appropriate dimensions of structures such as wing walls, dikes (identify the materials to be used in construction, as well as the methods by which the work is to be done), or excavations (length, width, and height). Indicate whether discharge of dredged or fill material is involved. Also, identify any structure to be constructed on a fill, piles, or float-supported platforms.

The written descriptions and illustrations are an important part of the application. Please describe, in detail, what you wish to do. If more space is needed, attach an extra sheet of paper marked Block 18.

Block 19. Proposed Project Purpose. Describe the purpose and need for the proposed project. What will it be used for and why? Also include a brief description of any related activities to be developed as the result of the proposed project. Give the approximate dates you plan to both begin and complete all work.

CFR 40 Part 230 Section 404(b)(1) Guidelines for Specification of Disposal Sites for Dredged or Fill Material

Subpart B--Compliance With the Guidelines

Sec. 230.10 Restrictions on discharge.

Note: Because other laws may apply to particular discharges and because the Corps of Engineers or State 404 agency may have additional procedural and substantive requirements, a discharge complying with the requirement of these Guidelines will not automatically receive a permit.

Although all requirements in Sec. 230.10 must be met, the compliance evaluation procedures will vary to reflect the seriousness of the potential for adverse impacts on the aquatic ecosystems posed by specific dredged or fill material discharge activities.

(a) Except as provided under section 404(b)(2), no discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences.

(1) For the purpose of this requirement, practicable alternatives include, but are not limited to:

(i) Activities which do not involve a discharge of dredged or fill material into the waters of the United States or ocean waters;

(ii) Discharges of dredged or fill material at other locations in waters of the United States or ocean waters;

(2) An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes. If it is otherwise a practicable alternative, an area not presently owned by the applicant, which could reasonably be obtained, utilized, expanded or managed in order to fulfill the basic purpose of the proposed activity may be considered.

(3) Where the activity associated with a discharge which is proposed for a special aquatic site (as defined in subpart E) does not require access or proximity to or sighting within the special aquatic site in question to fulfill its basic purpose (i.e., is not "water dependent"), practicable alternatives that do not involve special aquatic sites are presumed to be available, unless clearly demonstrated otherwise. In addition, where a discharge is proposed for a special aquatic site, all practicable alternatives to the proposed discharge, which do not involve a discharge into a special aquatic site are presumed to have less adverse impact on the aquatic ecosystem, unless clearly demonstrated otherwise.

(4) For actions subject to NEPA, where the Corps of Engineers is the permitting agency, the analysis of alternatives required for NEPA environmental documents, including supplemental Corps NEPA documents, will in most cases provide the information for the evaluation of alternatives under these Guidelines. On occasion, these

(4) Significantly adverse effects of discharge of pollutants on recreational, aesthetic, and economic values.

(d) Except as provided under section 404(b)(2), no discharge of dredged or fill material shall be permitted unless appropriate and practicable steps have been taken which will minimize potential adverse impacts of the discharge on the aquatic ecosystem. Subpart H identifies such possible steps.

Sec. 230.11 Factual Determinations.

The permitting authority shall determine in writing the potential short-term or long-term effects of a proposed discharge of dredged or fill material on the physical, chemical, and biological components of the aquatic environment in light of subparts C through F. Such factual determinations shall be used in Sec. 230.12 in making findings of compliance or non-compliance with the restrictions on discharge in Sec. 230.10. The evaluation and testing procedures described in Sec. 230.60 and Sec. 230.61 of subpart G shall be used as necessary to make, and shall be described in, such determination. The determinations of effects of each proposed discharge shall include the following:

(a) Physical substrate determinations. Determine the nature and degree of effect that the proposed discharge will have, individually and cumulatively, on the characteristics of the substrate at the proposed disposal site. Consideration shall be given to the similarity in particle size, shape, and degree of compaction of the material proposed for discharge and the material constituting the substrate at the disposal site, and any potential changes in substrate elevation and bottom contours, including changes outside of the disposal site which may occur as a result of erosion, slumpage, or other movement of the discharged material. The duration and physical extent of substrate changes shall also be considered. The possible loss of environmental values (Sec. 230.20) and actions to minimize impact (subpart H) shall also be considered in making these determinations. Potential changes in substrate elevation and bottom contours shall be predicted on the basis of the proposed method, volume, location, and rate of discharge, as well as on the individual and combined effects of current patterns, water circulation, wind and wave action, and other physical factors that may affect the movement of the discharged material.

(b) Water circulation, fluctuation, and salinity determinations. Determine the nature and degree of effect that the proposed discharge will have individually and cumulatively on water, current patterns, circulation including downstream flows, and normal water fluctuation. Consideration shall be given to water chemistry, salinity, clarity, color, odor, taste, dissolved gas levels, temperature, nutrients, and eutrophication plus other appropriate characteristics. Consideration shall also be given to the potential diversion or obstruction of flow, alterations of bottom contours, or other significant changes in the hydrologic regime. Additional consideration of the possible loss of environmental values (Secs. 230.23 through 230.25) and actions to minimize impacts (subpart H), shall be used in making these determinations. Potential significant effects on the current patterns, water circulation, normal water fluctuation and salinity shall be evaluated on the basis of the proposed method, volume, location, and rate of discharge.

(v) Discharge vessel speed and direction, if appropriate;
(vi) Rate of discharge;
(vii) Ambient concentration of constituents of interest;
(viii) Dredged material characteristics, particularly concentrations of constituents, amount of material, type of material (sand, silt, clay, etc.) and settling velocities;
(ix) Number of discharge actions per unit of time;
(x) Other factors of the disposal site that affect the rates and patterns of mixing.

(g) Determination of cumulative effects on the aquatic ecosystem.
(1) Cumulative impacts are the changes in an aquatic ecosystem that are attributable to the collective effect of a number of individual discharges of dredged or fill material. Although the impact of a particular discharge may constitute a minor change, in itself, the cumulative effect of numerous such piecemeal changes can result in a major impairment of the water resources and interfere with the productivity and water quality of existing aquatic ecosystems.
(2) Cumulative effects attributable to the discharge of dredged or fill material in waters of the United States should be predicted to the extent reasonable and practical. The permitting authority shall collect information and solicit information from other sources about the cumulative impacts on the aquatic ecosystem. This information shall be documented and considered during the decision-making process concerning the evaluation of individual permit applications, the issuance of a General permit, and monitoring and enforcement of existing permits.

(h) Determination of secondary effects on the aquatic ecosystem.
(1) Secondary effects are effects on an aquatic ecosystem that are associated with a discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material. Information about secondary effects on aquatic ecosystems shall be considered prior to the time final section 404 action is taken by permitting authorities.
(2) Some examples of secondary effects on an aquatic ecosystem are fluctuating water levels in an impoundment and downstream associated with the operation of a dam, septic tank leaching and surface runoff from residential or commercial developments on fill, and leachate and runoff from a sanitary landfill located in waters of the U.S. Activities to be conducted on fast land created by the discharge of dredged or fill material in waters of the United States may have secondary impacts within those waters which should be considered in evaluating the impact of creating those fast lands.

Sec. 230.12 Findings of compliance or non-compliance with the restrictions on discharge.

(a) On the basis of these Guidelines (subparts C through G) the proposed disposal sites for the discharge of dredged or fill material must be:
(1) Specified as complying with the requirements of these Guidelines; or
(2) Specified as complying with the requirements of these Guidelines with the inclusion of appropriate and practicable discharge conditions (see subpart H) to minimize pollution or adverse effects to the affected aquatic ecosystems; or
(3) Specified as failing to comply with the requirements of these Guidelines where:

(a) Suspended particulates in the aquatic ecosystem consist of fine-grained mineral particles, usually smaller than silt, and organic particles. Suspended particulates may enter water bodies as a result of land runoff, flooding, vegetative and planktonic breakdown, resuspension of bottom sediments, and man's activities including dredging and filling. Particulates may remain suspended in the water column for variable periods of time as a result of such factors as agitation of the water mass, particulate specific gravity, particle shape, and physical and chemical properties of particle surfaces.

(b) Possible loss of environmental characteristics and values: The discharge of dredged or fill material can result in greatly elevated levels of suspended particulates in the water column for varying lengths of time. These new levels may reduce light penetration and lower the rate of photosynthesis and the primary productivity of an aquatic area if they last long enough. Sight-dependent species may suffer reduced feeding ability leading to limited growth and lowered resistance to disease if high levels of suspended particulates persist. The biological and the chemical content of the suspended material may react with the dissolved oxygen in the water, which can result in oxygen depletion. Toxic metals and organics, pathogens, and viruses absorbed or adsorbed to fine-grained particulates in the material may become biologically available to organisms either in the water column or on the substrate. Significant increases in suspended particulate levels create turbid plumes which are highly visible and aesthetically displeasing. The extent and persistence of these adverse impacts caused by discharges depend upon the relative increase in suspended particulates above the amount occurring naturally, the duration of the higher levels, the current patterns, water level, and fluctuations present when such discharges occur, the volume, rate, and duration of the discharge, particulate deposition, and the seasonal timing of the discharge.

Sec. 230.22 Water.

(a) Water is the part of the aquatic ecosystem in which organic and inorganic constituents are dissolved and suspended. It constitutes part of the liquid phase and is contained by the substrate. Water forms part of a dynamic aquatic life-supporting system. Water clarity, nutrients and chemical content, physical and biological content, dissolved gas levels, pH, and temperature contribute to its life-sustaining capabilities.

(b) Possible loss of environmental characteristics and values: The discharge of dredged or fill material can change the chemistry and the physical characteristics of the receiving water at a disposal site through the introduction of chemical constituents in suspended or dissolved form. Changes in the clarity, color, odor, and taste of water and the addition of contaminants can reduce or eliminate the suitability of water bodies for populations of aquatic organisms, and for human consumption, recreation, and aesthetics. The introduction of nutrients or organic material to the water column as a result of the discharge can lead to a high biochemical oxygen demand (BOD), which in turn can lead to reduced dissolved oxygen, thereby potentially affecting the survival of many aquatic organisms. Increases in nutrients can favor one group of organisms such as algae to the detriment of other more desirable types such as submerged aquatic vegetation, potentially causing adverse health effects, objectionable tastes and odors, and other problems.

upstream regions can have equally adverse impacts. A significant reduction in the volume of fresh water moving into an estuary below that which is considered normal can affect the location and type of mixing thereby changing the characteristic salinity patterns. The resulting changed circulation pattern can cause the upstream migration of the salinity gradient displacing the maximum sedimentation zone. This migration may affect those organisms that are adapted to freshwater environments. It may also affect municipal water supplies.

Note: Possible actions to minimize adverse impacts regarding site characteristics can be found in subpart H.

Subpart D--Potential Impacts on Biological Characteristics of the Aquatic Ecosystem

Note: The impacts described in this subpart should be considered in making the factual determinations and the findings of compliance or non-compliance in subpart B.

Sec. 230.30 Threatened and endangered species.

(a) An endangered species is a plant or animal in danger of extinction throughout all or a significant portion of its range. A threatened species is one in danger of becoming an endangered species in the foreseeable future throughout all or a significant portion of its range. Listings of threatened and endangered species as well as critical habitats are maintained by some individual States and by the U.S. Fish and Wildlife Service of the Department of the Interior (codified annually at 50 CFR 17.11). The Department of Commerce has authority over some threatened and endangered marine mammals, fish and reptiles.

(b) Possible loss of values: The major potential impacts on threatened or endangered species from the discharge of dredged or fill material include:

(1) Covering or otherwise directly killing species;

(2) The impairment or destruction of habitat to which these species are limited. Elements of the aquatic habitat which are particularly crucial to the continued survival of some threatened or endangered species include adequate good quality water, spawning and maturation areas, nesting areas, protective cover, adequate and reliable food supply, and resting areas for migratory species. Each of these elements can be adversely affected by changes in either the normal water conditions for clarity, chemical content, nutrient balance, dissolved oxygen, pH, temperature, salinity, current patterns, circulation and fluctuation, or the physical removal of habitat; and

(3) Facilitating incompatible activities.

(c) Where consultation with the Secretary of the Interior occurs under section 7 of the Endangered Species Act, the conclusions of the Secretary concerning the impact(s) of the

food chain organisms. The availability of contaminants from the discharge of dredged or fill material may lead to the bioaccumulation of such contaminants in wildlife. Changes in such physical and chemical factors of the environment may favor the introduction of undesirable plant and animal species at the expense of resident species and communities. In some aquatic environments lowering plant and animal species diversity may disrupt the normal functions of the ecosystem and lead to reductions in overall biological productivity.

Note: Possible actions to minimize adverse impacts regarding characteristics of biological components of the aquatic ecosystem can be found in subpart H.

Subpart E--Potential Impacts on Special Aquatic Sites

Note: The impacts described in this subpart should be considered in making the factual determinations and the findings of compliance or non-compliance in subpart B. The definition of special aquatic sites is found in Sec. 230.3(q-1).

Sec. 230.40 Sanctuaries and refuges.

(a) Sanctuaries and refuges consist of areas designated under State and Federal laws or local ordinances to be managed principally for the preservation and use of fish and wildlife resources.

(b) Possible loss of values: Sanctuaries and refuges may be affected by discharges of dredged or fill material which will:

(1) Disrupt the breeding, spawning, migratory movements or other critical life requirements of resident or transient fish and wildlife resources;

(2) Create unplanned, easy and incompatible human access to remote aquatic areas;

(3) Create the need for frequent maintenance activity;

(4) Result in the establishment of undesirable competitive species of plants and animals;

(5) Change the balance of water and land areas needed to provide cover, food, and other fish and wildlife habitat requirements in a way that modifies sanctuary or refuge management practices;

(6) Result in any of the other adverse impacts discussed in subparts C and D as they relate to a particular sanctuary or refuge.

Sec. 230.41 Wetlands.

(a)(1) Wetlands consist of areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

(2) Where wetlands are adjacent to open water, they generally constitute the transition to upland. The margin between wetland and open water can best be established by

decomposition process occurring on the mud flat and change the deposition of suspended material affecting the productivity of the area. Changes may reduce the mud flat's capacity to dissipate storm surge runoff.

Sec. 230.43 Vegetated shallows.

(a) Vegetated shallows are permanently inundated areas that under normal circumstances support communities of rooted aquatic vegetation, such as turtle grass and eelgrass in estuarine or marine systems as well as a number of freshwater species in rivers and lakes.

(b) Possible loss of values: The discharge of dredged or fill material can smother vegetation and benthic organisms. It may also create unsuitable conditions for their continued vigor by:

(1) Changing water circulation patterns;

(2) releasing nutrients that increase undesirable algal populations;

(3) releasing chemicals that adversely affect plants and animals;

(4) increasing turbidity levels, thereby reducing light penetration and hence photosynthesis; and

(5) changing the capacity of a vegetated shallow to stabilize bottom materials and decrease channel shoaling. The discharge of dredged or fill material may reduce the value of vegetated shallows as nesting, spawning, nursery, cover, and forage areas, as well as their value in protecting shorelines from erosion and wave actions. It may also encourage the growth of nuisance vegetation.

Sec. 230.44 Coral reefs.

(a) Coral reefs consist of the skeletal deposit, usually of calcareous or silicaceous materials, produced by the vital activities of anthozoan polyps or other invertebrate organisms present in growing portions of the reef.

(b) Possible loss of values: The discharge of dredged or fill material can adversely affect colonies of reef building organisms by burying them, by releasing contaminants such as hydrocarbons into the water column, by reducing light penetration through the water, and by increasing the level of suspended particulates. Coral organisms are extremely sensitive to even slight reductions in light penetration or increases in suspended particulates. These adverse effects will cause a loss of productive colonies which in turn provide habitat for many species of highly specialized aquatic organisms.

Sec. 230.45 Riffle and pool complexes.

(a) Steep gradient sections of streams are sometimes characterized by riffle and pool complexes. Such stream sections are recognizable by their hydraulic characteristics. The rapid movement of water over a coarse substrate in riffles results in a rough flow, a turbulent surface, and high dissolved oxygen levels in the water. Pools are deeper areas associated with riffles. Pools are characterized by a slower stream velocity, a steaming

(a) Recreational and commercial fisheries consist of harvestable fish, crustaceans, shellfish, and other aquatic organisms used by man.

(b) Possible loss of values: The discharge of dredged or fill materials can affect the suitability of recreational and commercial fishing grounds as habitat for populations of consumable aquatic organisms. Discharges can result in the chemical contamination of recreational or commercial fisheries. They may also interfere with the reproductive success of recreational and commercially important aquatic species through disruption of migration and spawning areas. The introduction of pollutants at critical times in their life cycle may directly reduce populations of commercially important aquatic organisms or indirectly reduce them by reducing organisms upon which they depend for food. Any of these impacts can be of short duration or prolonged, depending upon the physical and chemical impacts of the discharge and the biological availability of contaminants to aquatic organisms.

Sec. 230.52 Water-related recreation.

(a) Water-related recreation encompasses activities undertaken for amusement and relaxation. Activities encompass two broad categories of use: consumptive, e.g., harvesting resources by hunting and fishing; and non-consumptive, e.g. canoeing and sight-seeing.

(b) Possible loss of values: One of the more important direct impacts of dredged or fill disposal is to impair or destroy the resources, which support recreation activities. The disposal of dredged or fill material may adversely modify or destroy water use for recreation by changing turbidity, suspended particulates, temperature, dissolved oxygen, dissolved materials, toxic materials, pathogenic organisms, quality of habitat, and the aesthetic qualities of sight, taste, odor, and color.

Sec. 230.53 Aesthetics.

(a) Aesthetics associated with the aquatic ecosystem consist of the perception of beauty by one or a combination of the senses of sight, hearing, touch, and smell. Aesthetics of aquatic ecosystems apply to the quality of life enjoyed by the general public and property owners.

(b) Possible loss of values: The discharge of dredged or fill material can mar the beauty of natural aquatic ecosystems by degrading water quality, creating distracting disposal sites, inducing inappropriate development, encouraging unplanned and incompatible human access, and by destroying vital elements that contribute to the compositional harmony or unity, visual distinctiveness, or diversity of an area. The discharge of dredged or fill material can adversely affect the particular features, traits, or characteristics of an aquatic area which make it valuable to property owners. Activities which degrade water quality, disrupt natural substrate and vegetational characteristics, deny access to or visibility of the resource, or result in changes in odor, air quality, or noise levels may reduce the value of an aquatic area to private property owners.

site, or carried out on similar material for other permitted projects in the vicinity. Materials shall be considered similar if the sources of contamination, the physical configuration of the sites and the sediment composition of the materials are comparable, in light of water circulation and stratification, sediment accumulation and general sediment characteristics. Tests from other sites may be relied on only if no changes have occurred at the extraction sites to render the results irrelevant. (3) Any potential for significant introduction of persistent pesticides from land runoff or percolation;

(4) Any records of spills or disposal of petroleum products or substances designated as hazardous under section 311 of the Clean Water Act (See 40 CFR part 116);

(5) Information in Federal, State and local records indicating significant introduction of pollutants from industries, municipalities, or other sources, including types and amounts of waste materials discharged along the potential routes of contaminants to the extraction site; and

(6) Any possibility of the presence of substantial natural deposits of minerals or other substances which could be released to the aquatic environment in harmful quantities by man-induced discharge activities.

(c) To reach the determinations in Sec. 230.11 involving potential effects of the discharge on the characteristics of the disposal site, the narrative guidance in subparts C through F shall be used along with the general evaluation procedure in Sec. 230.60 and, if necessary, the chemical and biological testing sequence in Sec. 230.61. Where the discharge site is adjacent to the extraction site and subject to the same sources of contaminants, and materials at the two sites are substantially similar, the fact that the material to be discharged may be a carrier of contaminants is not likely to result in degradation of the disposal site. In such circumstances, when dissolved material and suspended particulates can be controlled to prevent carrying pollutants to less contaminated areas, testing will not be required.

(d) Even if the Sec. 230.60(b) evaluation (previous tests, the presence of polluting industries and information about their discharge or runoff into waters of the U.S., bio-inventories, etc.) leads to the conclusion that there is a high probability that the material proposed for discharge is a carrier of contaminants, testing may not be necessary if constraints are available to reduce contamination to acceptable levels within the disposal site and to prevent contaminants from being transported beyond the boundaries of the disposal site, if such constraints are acceptable to the permitting authority and the Regional Administrator, and if the potential discharger is willing and able to implement such constraints. However, even if tests are not performed, the permitting authority must still determine the probable impact of the operation on the receiving aquatic ecosystem. Any decision not to test must be explained in the determinations made under Sec. 230.11.
Sec. 230.61 Chemical, biological, and physical evaluation and testing.

Note: The Agency is today proposing revised testing guidelines. The evaluation and testing procedures in this section are based on the 1975 section 404(b)(1) interim final Guidelines and shall remain in effect until the revised testing guidelines are published as final regulations.

interpreted in terms of the potential for harm as supported by any pertinent scientific literature.

(2) When an analysis of biological community structure will be of value to assess the potential for adverse environmental impact at the proposed disposal site, a comparison of the biological characteristics between the excavation and disposal sites may be required by the permitting authority. Biological indicator species may be useful in evaluating the existing degree of stress at both sites. Sensitive species representing community components colonizing various substrate types within the sites should be identified as possible bioassay organisms if tests for toxicity are required. Community structure studies should be performed only when they will be of value in determining discharge conditions. This is particularly applicable to large quantities of dredged material known to contain adverse quantities of toxic materials. Community studies should include benthic organisms such as microbiota and harvestable shellfish and finfish. Abundance, diversity, and distribution should be documented and correlated with substrate type and other appropriate physical and chemical environmental characteristics.

(d) Physical tests and evaluation. The effect of a discharge of dredged or fill material on physical substrate characteristics at the disposal site, as well as on the water circulation, fluctuation, salinity, and suspended particulates content there, is important in making factual determinations in Sec. 230.11. Where information on such effects is not otherwise available to make these factual determinations, the permitting authority shall require appropriate physical tests and evaluations as are justified and deemed necessary. Such tests may include sieve tests, settleability tests, compaction tests, mixing zone and suspended particulate plume determinations, and site assessments of water flow, circulation, and salinity characteristics.

Subpart H--Actions To Minimize Adverse Effects

Note: There are many actions which can be undertaken in response to Sec. 203.10(d) to minimize the adverse effects of discharges of dredged or fill material. Some of these, grouped by type of activity, are listed in this subpart.

Sec. 230.70 Actions concerning the location of the discharge.

The effects of the discharge can be minimized by the choice of the disposal site. Some of the ways to accomplish this are by:

(a) Locating and confining the discharge to minimize smothering of organisms;

(b) Designing the discharge to avoid a disruption of periodic water inundation patterns;

(c) Selecting a disposal site that has been used previously for dredged material discharge;

(d) Selecting a disposal site at which the substrate is composed of material similar to that being discharged, such as discharging sand on sand or mud on mud;

The effects of a discharge can be minimized by the manner in which it is dispersed, such as:

(a) Where environmentally desirable, distributing the dredged material widely in a thin layer at the disposal site to maintain natural substrate contours and elevation;

(b) Orienting a dredged or fill material mound to minimize undesirable obstruction to the water current or circulation pattern, and utilizing natural bottom contours to minimize the size of the mound;

(c) Using silt screens or other appropriate methods to confine suspended particulate/turbidity to a small area where settling or removal can occur;

(d) Making use of currents and circulation patterns to mix, disperse and dilute the discharge;

(e) Minimizing water column turbidity by using a submerged diffuser system. A similar effect can be accomplished by submerging pipeline discharges or otherwise releasing materials near the bottom;

(f) Selecting sites or managing discharges to confine and minimize the release of suspended particulates to give decreased turbidity levels and to maintain light penetration for organisms;

(g) Setting limitations on the amount of material to be discharged per unit of time or volume of receiving water.

Sec. 230.74 Actions related to technology.

Discharge technology should be adapted to the needs of each site. In determining whether the discharge operation sufficiently minimizes adverse environmental impacts, the applicant should consider:

(a) Using appropriate equipment or machinery, including protective devices, and the use of such equipment or machinery in activities related to the discharge of dredged or fill material;

(b) Employing appropriate maintenance and operation on equipment or machinery, including adequate training, staffing, and working procedures;

(c) Using machinery and techniques that are especially designed to reduce damage to wetlands. This may include machines equipped with devices that scatter rather than mound excavated materials, machines with specially designed wheels or tracks, and the use of mats under heavy machines to reduce wetland surface compaction and rutting;

(c) Timing the discharge to avoid the seasons or periods when human recreational activity associated with the aquatic site is most important;

(d) Following discharge procedures which avoid or minimize the disturbance of aesthetic features of an aquatic site or ecosystem;

(e) Selecting sites that will not be detrimental or increase incompatible human activity, or require the need for frequent dredge or fill maintenance activity in remote fish and wildlife areas;

(f) Locating the disposal site outside of the vicinity of a public water supply intake.

Sec. 230.77 Other actions.

(a) In the case of fills, controlling runoff and other discharges from activities to be conducted on the fill;

(b) In the case of dams, designing water releases to accommodate the needs of fish and wildlife;

(c) In dredging projects funded by Federal agencies other than the Corps of Engineers, maintain desired water quality of the return discharge through agreement with the Federal funding authority on scientifically defensible pollutant concentration levels in addition to any applicable water quality standards;

(d) When a significant ecological change in the aquatic environment is proposed by the discharge of dredged or fill material, the permitting authority should consider the ecosystem that will be lost as well as the environmental benefits of the new system.

Subpart I--Planning To Shorten Permit Processing Time

Sec. 230.80 Advanced identification of disposal areas.

(a) Consistent with these Guidelines, EPA and the permitting authority, on their own initiative or at the request of any other party and after consultation with any affected State that is not the permitting authority, may identify sites which will be considered as:

(1) Possible future disposal sites, including existing disposal sites and non-sensitive areas; or

(2) Areas generally unsuitable for disposal site specification;

(b) The identification of any area as a possible future disposal site should not be deemed to constitute a permit for the discharge of dredged or fill material within such area or a specification of a disposal site. The identification of areas that generally will not be available for disposal site specification should not be deemed as prohibiting applications for permits to discharge dredged or fill material in such areas. Either type of

US Army Corps of Engineers®

SPECIAL PUBLIC NOTICE

Final Map and Drawing Standards for the South Pacific Division Regulatory Program

August 6, 2012

Corps contacts:
Sacramento District: Michael Finan (916) 557-5324 (Michael.C.Finan@usace.army.mil)
San Francisco District: Paula Gill (415) 503-6776 (Paula.C.Gill@usace.army.mil)
Los Angeles District: Dan Swenson (213) 452-3414 (Daniel.P.Swenson@usace.army.mil)
Albuquerque District: Deanna Cummings (505) 342-3280 (Deanna.L.Cummings@usace.army.mil)
South Pacific Division: Thomas Cavanaugh (415) 503-6574 (Thomas.J.Cavanaugh@usace.army.mil)

Introduction: This notice establishes final standards and guidelines for maps and drawings submitted as part of delineations and applications for U.S. Army permits and jurisdictional determinations. The intent of these standards is to improve the quality and consistency of maps and drawings and simplify and improve review and processing by Corps Regulatory project managers. We estimate that at least 70-80% of maps and drawings submitted to the Corps Regulatory Program in South Pacific Division (comprised of Albuquerque, San Francisco, Sacramento, and Los Angeles districts) already meet the majority of these standards. By adhering to a single standard for maps and drawings, applicants and consultants should have a clear and concise product, and project managers should be able to provide permit decisions and jurisdictional determinations in a more consistent and timely manner. In addition, electronic mapping of permit-related maps and drawings will enable data sharing with other resource agencies for coordination of mitigation decision-making.

Applicability: These standards apply to all submittals to Regulatory Divisions, within the Districts of the Corps' South Pacific Division, and supersede all previous SPD district-specific standards related to map and drawing requirements. At the Corps' discretion, these standards may be modified or waived on a case by case basis, for example, projects or activities with small or temporary impacts to waters of the U.S. (for example, less than a tenth of an acre of permanent impact), projects where the applicant possesses limited financial resources (for example, private homeowners and small land owners), emergencies, and restoration projects with limited grant funding. Additional examples where these standards may be modified or waived include reauthorization of previously-authorized work and maintenance, repair, and/or rehabilitation projects where the original authorization included adequate drawings that are available. In general, compensatory mitigation plans must adhere to these standards, regardless of whether the standards are waived for the overall project.

Standards:

1) General:
   a. Documents must include at a minimum: location (vicinity) map(s) and plan view map(s). Mitigation plans and construction drawings should also include representative cross-sectional views. Delineation maps must be provided for the project area, staging areas, disposal sites, access routes, and proposed mitigation sites, etc.
   b. The orientation of the map on the page (as it is read) must be the same for all maps submitted.
   c. By convention, North will normally be toward the top of the page.

b. Clearly annotate all fills, structures, and /or limits of work as either permanent or temporary.
c. Pre-construction drawings (grading plans) and post-construction drawings (as-built plans) must include name, company/agency, and signature of preparer, date signed, drawing title, and total number of sheets.
d. Both plan view and cross-sectional view maps must be provided.

4) Post-construction drawings (as-built plans):
a. Both plan view and cross-sectional view maps must be provided.
b. Must be the same size and alignment (spatial) as authorized grading plans (i.e., grading plans and as-built plans must overlay such that structures, boundaries, etc. align).
c. Show any deviations from the fills and/or structures authorized as part of an approved pre-construction drawing in red.

5) Delineations of waters of the U.S.:
a. Plan view maps must be provided.
b. Cross-sectional view drawings must be provided at the Corps project manager's discretion. Examples of when cross-sectional view drawings would be appropriate include stream or wetland restorations, stream crossings, proposed structures, and delineations of tidal areas.
c. Clearly show location and extent of all areas potentially meeting the criteria for waters of the U.S., including special aquatic sites (e.g., wetlands, sanctuaries and refuges, mudflats, vegetated shallows, and riffle and pool complexes), and/or navigable waters. Each type of boundary (for example, ordinary high water mark, mean high water, wetlands or other special aquatic sites, and high tide line) must be clearly annotated and/or symbolized to ensure they are differentiable on the map.
d. The survey area boundary must be clearly annotated and/or symbolized and must include all potential waters of the U.S. The survey area boundary encloses the spatial area for which a Corps jurisdictional determination is being requested. Show locations of any wetland delineation or ordinary high water mark data points, labeled according to the number of the corresponding wetland delineation form or ordinary high water mark data sheet. Generally, a wetland boundary must be based on sets of at least two wetland delineation data points, one within the proposed wetland boundary and one outside it.
e. Include representative ordinary high water mark (OHWM) widths where measured in the field (averages may be acceptable for uniform channel reaches). OHWM widths must be shown with a transect/profile line (e.g., A-A') labeled with the corresponding width measurement in feet. In some cases, a corresponding cross section may be required, in which case the cross section must include the corresponding OHWM elevations.
f. Include information not directly related to a delineation of waters of the U.S. on a separate map(s).
g. If there are tidal areas within the survey area, identify the location and elevation of Mean High Water and the High Tide Line on all maps and cross-section drawings.
h. Each line or polygon representing a water of the U.S. must be labeled with a unique name (for example, WL1, WL2, VP1, VP2, STR1, STR2, etc.). The delineation report must be accompanied by the attached Aquatic Resources.xlsx table (Excel file format).
i. If impact areas within waters of the U.S. are shown, those must also be labeled with a unique name (for example,). In this case, the delineation report must also be accompanied by the attached Impacts.xlsx table (Excel file format).
j. If submitted, delineation-related GIS data must use the unique names as described above and conform to the Aquatic Resources.xlsx and Impacts.xlsx data tables and must include a text file of metadata, including datum, projection, and mapper contact information.

6) Mitigation plans and long-term preservation (LTP) maps (see attached example map, Figure 1):
a. Both plan view and cross-sectional view maps must be provided.
b. Mitigation boundaries must be clearly differentiable based on mitigation type: establishment, re-establishment, rehabilitation, enhancement, and preservation only. Establishment boundaries must use a dotted line. Re-establishment boundaries must use a dashed line. Rehabilitation boundaries must use an alternating dash-dot-dash line. Enhancement areas must use a hatched line. LTP boundaries

US Army Corps of Engineers®

REGULATORY GUIDANCE LETTER

No. 08-03 **Date: 10 October 2008**

SUBJECT: Minimum Monitoring Requirements for Compensatory Mitigation Projects Involving the Restoration, Establishment, and/or Enhancement of Aquatic Resources.

1. Purpose and Applicability

a. Purpose. This Regulatory Guidance Letter (RGL) provides the Districts and regulated public guidance on minimum monitoring requirements for compensatory mitigation projects, including the required minimum content for monitoring reports. This RGL replaces RGL 06-03.

b. Applicability. The final Mitigation Rule published on April 10, 2008, states that the submission of monitoring reports to assess the development and condition of compensatory mitigation projects is required, but the content and level of detail for those reports must be commensurate with the scale and scope of the compensatory mitigation projects as well as the compensatory mitigation project type (see 33 CFR 332.6(a)(1)).

This RGL applies to all Department of the Army (DA) permit authorizations under Section 404 of the Clean Water Act and Sections 9 and 10 of the Rivers and Harbors Act that contain special conditions requiring compensatory mitigation provided through aquatic resource restoration, establishment and/or enhancement. This guidance also applies to monitoring reports that are prepared for mitigation bank sites and in-lieu-fee project sites.

This RGL supports the Program Analysis and Review Tool (PART) program goals for the Regulatory Program. Specifically, this RGL supports the PART performance measures for mitigation site compliance and mitigation bank/ in-lieu-fee compliance. These measures apply to active mitigation sites, mitigation banks, and in-lieu-fee project sites that still require monitoring.

2. Background

Recent studies by the Government Accountability Office (GAO) and National Research Council (NRC) indicated that the U.S. Army Corps of Engineers (Corps) was not providing adequate oversight to ensure that compensatory mitigation projects were successfully replacing the aquatic resource functions lost as a result of permitted activities. For example, the GAO study determined that many project files requiring

special conditions to determine if the site is achieving the desired functional capacity. Compensatory mitigation projects offset the impacts to diverse types of aquatic resources, including riverine and estuarine habitats. Special conditions of the DA permits will clearly state performance standards specific to the type and function of the ecosystem in relation to the objectives of the compensatory mitigation project.

ii. Monitoring Timeframe. The special conditions of the DA permit (or the mitigation plan as referenced in the special conditions) must specify the length of the monitoring period (see 33 CFR 332.6(a)(1)). For mitigation banks, the length of the monitoring period will be specified in either the DA permit, mitigation banking instrument, or approved mitigation plan. For in-lieu fee projects, the length of the monitoring period will be specified in either the DA permit or the approved in-lieu fee project plan.

The monitoring period must be sufficient to demonstrate that the compensatory mitigation project has met performance standards, but not less than five years (see 33 CFR 332.6(b)). The District determines how frequently monitoring reports are submitted, the monitoring period length, and report content. If a compensatory mitigation project has met its performance standards in less than five years, the monitoring period length can be reduced, if there are at least two consecutive monitoring reports that demonstrate that success. Permit conditions will support the specified monitoring requirement and include deadlines for monitoring report submittal. Longer monitoring timeframes are necessary for compensatory mitigation projects that take longer to develop (see 33 CFR 332.6(b)). For example, forested wetland restoration may take longer than five years to meet performance standards.

Annual monitoring and reporting to the Corps is appropriate for most types of compensatory mitigation projects, though the project sponsor may have to monitor progress more often during the project's early stages. Certain compensatory mitigation projects may require more frequent monitoring and reporting during the early stages of development to allow project managers to quickly address problems and/or concerns. Annual monitoring can resume once the project develops in accordance with the approved performance standards. In cases where monitoring is required for longer than five years, monitoring may be conducted on a less than annual timeframe (such as every other year), though yearly monitoring is recommended until the project becomes established as a successful mitigation project. In this case, off-year monitoring should include some form of screening assessment such as driving by the mitigation site, telephone conversations regarding condition of the mitigation site, etc. On-site conditions, the complexity of the approved mitigation plan, and unforeseen circumstances will ultimately determine whether the monitoring period should be extended beyond the specified monitoring time frame for a particular project. Complex and/or ecologically significant compensatory mitigation projects should have higher priority for site visits.

As discussed above, the remaining monitoring requirements may be waived upon a determination that the compensatory mitigation project has achieved its performance standards. The original monitoring period may be extended upon a determination that

conditions, as well as the results of functional, condition, or other assessments used to provide quantitative or qualitative measures of the functions provided by the compensatory mitigation project site.

c. Monitoring Report Narrative:

i. Project Overview (1 page)

(1) Corps Permit Number or Name of the Mitigation Bank or In-Lieu Fee Project

(2) Name of party responsible for conducting the monitoring and the date(s) the inspection was conducted.

(3) A brief paragraph describing the purpose of the approved project, acreage and type of aquatic resources impacted, and mitigation acreage and type of aquatic resources authorized to compensate for the aquatic impacts.

(4) Written description of the location, any identifiable landmarks of the compensatory mitigation project including information to locate the site perimeter(s), and coordinates of the mitigation site (expressed as latitude, longitudes, UTMs, state plane coordinate system, etc.).

(5) Dates the compensatory mitigation project commenced and/or was completed.

(6) Short statement on whether the performance standards are being met.

(7) Dates of any recent corrective or maintenance activities conducted since the previous report submission.

(8) Specific recommendations for any additional corrective or remedial actions.

ii. Requirements (1 page)

List the monitoring requirements and performance standards, as specified in the approved mitigation plan, mitigation banking instrument, or special conditions of the DA permit, and evaluate whether the compensatory mitigation project site is successfully achieving the approved performance standards or trending towards success. A table is a recommended option for comparing the performance standards to the conditions and status of the developing mitigation site.

iii. Summary Data (maximum of 4 pages)

Summary data should be provided to substantiate the success and/or potential challenges associated with the compensatory mitigation project. Photo documentation may be provided to support the findings and recommendations referenced in the monitoring report and to assist the PM in assessing whether the compensatory mitigation project is meeting applicable performance standards for that monitoring period. Submitted photos should be formatted to print on a standard 8 ½" x 11" piece of paper, dated, and clearly labeled with the direction from which the photo was taken. The photo location points should also be identified on the appropriate maps.

Monterey Airport District
Scoping Meeting on EIR for Airport Master Plan
Monterey Peninsula Airport Board of Directors

Dear Board members:

The information provided below are comments received from residents of Casanova Oak Knoll Neighborhood Association members regarding your pending Master Plan. These are initial comments, many of which we will go into detail at a future date.

EIR Lacks Analysis of Early-Turn and Take-Off Operations and Public Safety Considerations

Early-Turn and Take-Offs Authorized by FAA

The FAA changes now permit early-turn and take-offs, which allow aircraft to take-off before reaching the end of the runaway, and depart at an angle, sideways from the runway. Aircraft can now depart the runway early, turn and climb away at any point.

Take-offs such as these do not make use of the existing crash safety zone at the ends of the runway. This is not clearly explained in the EIR.

The EIR focuses on runway centerline take-offs using safety zones at either end of runways 28L and 28R. A center-line take-off affords a climbing aircraft a ground distance of over 6,000 feet of clear safety zone to climb out over. These operations and flight profiles are discussed in the EIR.

Runway 10L-28R is heavily used by general aviation operators, accounting for approximately 50% of total airport operations (page 6/3 Errata Chapter 6

Public Safety Concerns Not Addressed

Early-turn and take-offs from Runway 28L place turning/climbing aircraft immediately over on-site commercial buildings, aircraft operations and storage. After a ground distance of approximately 1,000 to 1,800 feet, aircraft are still climbing, turning and transitioning at low altitude but now over a residential neighborhood. This is a significant change to aircraft operations which is not addressed in the EIR.

These operations have departing aircraft climbing and turning at low altitude over a residential neighborhood with a preschool and some of the highest density multi-story housing in the City of Monterey. This endangers public safety and adversely impacts the well-being of residents. The operation of two pre-schools in the neighborhood needs to be mentioned and addressed according to Federal guidelines on height of Airport over these facilities. Noise and ground safety issues need to be addressed.

Impacts to North Side Development Not Adequately Addressed

The EIR does not adequately address possible safety concerns to existing and proposed on-site airport development adjacent to and north of Runway 28R.

The two access points designated in the EIR does not address the contingency that the Canyon Del Rey access not be built because of Del Rey Oaks withdrawing its consent, engineering costs may be too high and the same for construction costs. What is the alternative to development if Airport Road is the only option?

A description of planned future use, size of buildings, height of buildings, and number of vehicles generated each day. The EIR needs to consider the type of vehicles, weights of vehicles, cars, trucks, semi-trucks, and/or construction vehicles.

What are the proposed mitigations for this traffic passing through residential streets?

If there is an increase in traffic, the mitigations need to address the current situation on N. Fremont at peak hours. This long standing gridlock is seeing vehicles transiting through the back of our neighborhood to avoid the stoplights on N. Fremont. The Monterey Neighborhood Improvement Program has spent large sums of its budget on traffic calming addressing these issues. The Monterey Airport District generates about 20% of this impact, but needs to contribute accordingly to the solutions. This also applies to current drainage from the Airport property and in particular to the new growth (paving) in the Plan.

The EIR does not address the issue of proposed land use development on the north side also being over flown at low altitude by aircraft departing using early-turn and take-offs. Extensive new buildings, aircraft storage, non-aviation related commercial development, and a new larger fuel depot are proposed for the north side of the airport.

Our last point is in regards the two proposed access points for vehicles. As we read the EIR we see that vehicles have the option of using the Canyon Del Rey access point **or** Airport Road. In previous years planning meetings a card/key gate was shown between the New Northside and the Old Northside. All new traffic would be using Canyon Del Rey, only public safety vehicles were to use the card gate.

Logistically the majority of the destinations of vehicles would be to the Peninsula, thereby using Airport Road as the shortest, fastest route. This is unacceptable to our neighborhood. This is not discussed in the Master Plan. CONA requests a search of Airport documents showing the maps with this promised gate, and the inclusion of these documents in the Master Plan.

Sincerely,

Richard Ruccello, CONA president

Subject: EIR concerns

Dear Ms. Glennon:

I am responding to your letter of 12/28/15 regarding the EIR for the Monterey Airport. Our home backs on to the airport.

My current concerns are about two sources of noise pollution. The first one is some kind of activity that is carried out from time to time in the middle of the night and involves vehicles backing up with attendant beeping signals along with machinery or equipment running noisily. These sounds wake us up in the middle of the night and disturb our sleep. We would like the current activities to cease during normal sleeping hours and for there to be no further expansion of such nighttime noise pollution.

The second source of noise pollution comes from certain small private aircraft. I don't know what the aeronautical equivalent of a muffler is, but that is what is needed. Some hobbyist pilots appear to be oblivious to the loud noise their toys produce and they are annoying the whole neighborhood.

Thank you for your attention to these matters.

Sincerely,
Elizabeth Stacey
Del Rey Oaks

RE: SCH# 2015121105, Monterey Regional Master Plan

Dear Mr. Bautista:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP) for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code § 21000 et seq.), specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b) (CEQA Guidelines Section 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared. (Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd.(a)(1) (CEQA Guidelines § 15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code § 21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code § 21084.3 (a)). **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. § 800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws**.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
   a. A brief description of the project.
   b. The lead agency contact information.
   c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code § 21080.3.1 (d)).

d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code § 21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code § 21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. (Pub. Resources Code § 21080.3.1(b)).
   a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18). (Pub. Resources Code § 21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
   a. Alternatives to the project.
   b. Recommended mitigation measures.
   c. Significant effects. (Pub. Resources Code § 21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
   a. Type of environmental review necessary.
   b. Significance of the tribal cultural resources.
   c. Significance of the project's impacts on tribal cultural resources.
   d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code § 21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code § 21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
   a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
   b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code § 21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
   a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
   b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code § 21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code § 21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code section 21084.3 (b). (Pub. Resources Code § 21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.
ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
i. Protecting the cultural character and integrity of the resource.
ii. Protecting the traditional use of the resource.
iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code § 21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a nonfederally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code § 815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code § 5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An environmental impact report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code § 21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code § 65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code § 65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code section 65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction. (Gov. Code § 65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
   a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
   b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52

and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
   a. If part or all of the APE has been previously surveyed for cultural resources.
   b. If any known cultural resources have been already been recorded on or adjacent to the APE.
   c. If the probability is low, moderate, or high that cultural resources are located in the APE.
   d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
   a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
   b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Sincerely,

Joshua Standing Horse

Re: IS/NOP for EIR on Monterey Regional Airport – Airport Master Plan

Dear Ms. Glennon:

Thank you for providing the Monterey Bay Unified Air Pollution Control District (Air District) with the opportunity to provide scoping level input on the above NOP.

The Air District has reviewed the document and has the following comments:

1. Roundabouts, Exhibit 2 after Page 6 – This figure, as well as the Roadway Improvement discussion on page 13, indicate that at least two roundabouts are proposed as part of the Master Plan including one at Olmsted and Highway 68. The Air District supports roundabouts since they can reduce criteria as well as GHG emissions while facilitating traffic flow. Improving circulation on Highway 68 could benefit the airport as well as the general public. Partial funding for these roundabouts may be available through the Air District's AB 2766 grant program. Please contact Alan Romero, Air Quality Planner (831)647-9411 x241 for details.

2. Construction Near Neighborhoods, Exhibit 2 after Page 6 – This same figure suggests that construction/development will be occurring near neighborhoods, particularly along the northern perimeter of the airport. The Air District requests that additional diligence be used along these perimeters so as to not create a public nuisance due to dust or odors (See District Rule 402 - Nuisances). This could include additional watering in these areas, use of clean fuels such as propane or natural gas to power the construction equipment and the staging of activity so that clusters of heavy duty construction equipment are not operating all at once near these homes.

3. Project Description, Demolition of Existing Terminal. Pg. 13 – The first sentence indicates that the 60 year old passenger terminal will be demolished. Given the age of the structure, as well as other older facilities at the airport that may be removed, there is a potential for hazardous materials (asbestos and lead based paint) to be encountered. Should that occur, the requirements of Air District Rule 424 National Emissions Standards for Hazardous Air Pollutants could be triggered. Rule 424 contains the investigation and reporting requirements for asbestos. If you have any questions about District Rule 424 and prior to any demolition activities, please contact Mike Sheehan, District Compliance Program Coordinator, at (831) 647-9411 x217.

4. Environmental Checklist, III Air Quality a) to f), and Pg.s 29-30 - This section indicates that the project could have a potentially significant impact for all five elements on the list. We therefore support the plan to do a thorough study of the construction and operational phase emissions associated with the project.

Please follow the Air District's CEQA Air Quality Guidelines in developing this evaluation. The document can be downloaded at: http://mbuapcd.org/pdf/CEQA_full%20(1).pdf .

5. Environmental Checklist, VII. Greenhouse Gas Emissions, Pg. 34 – This section also indicates a potentially significant impact related to greenhouse gas emissions. The Air District suggests that the following measures be considered to mitigate GHG emissions:
   - Use solar energy as a supplemental source of electricity and heat for hot water.
   - The solar panels could be used in parking lots to create canopies that shade the cars while minimizing heat island effects caused by the pavement.
   - Create shaded areas using trees which can also remove criteria as well as GHG emissions from the air.
   - Use high efficiency LED lights where practical.
   - Expand the existing EV charging network by installing fast charge EV charge stations in the new areas of the airport.

6. List of Acronyms, Pg. 55 – This list shows MCUAPCD for a Monterey County Unified Air Pollution Control District. Please note, there is no such county level agency as the regional Air District has jurisdiction over all three counties that comprise the North Central Coast Air Basin. Also, the new name of the Air District is the Monterey Bay Air Resources District (MBARD), although the previous name, the Monterey Bay Unified Air Pollution Control District (MBUAPCD), can still be used for the time being.

7. Ground Support Vehicles - Encourage the replacement of gasoline or diesel fueled vehicles with either plug-in electric (PEV), fuel cell, propane or natural gas powered ground support vehicles to help reduce project related criteria and GHG emissions.

Please let me know if you have any questions. I can be reached at (831) 647-9418 ext. 226 or bnunes@mbuapcd.org.

Best Regards,

Robert Nunes

Subject: Notice of Preparation of Environmental Impact Report for the Monterey Regional Airport Master Plan

Dear Ms. Glennon:

The Monterey Peninsula Water Management District (MPWMD or District) appreciates the opportunity to comment on the Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for the Monterey Peninsula Airport District's (MPAD) Initial Study on the Monterey Regional Airport Master Plan (AMP). The Initial Study evaluates the potential environmental effects of the proposed AMP. The project includes recommendations of improvements that will enhance the Airport's safety capabilities to the maximum extent feasible and projects aeronautical facility needs through the year 2033. The District will rely on the certified EIR for the issuance of Water Permits and Water Distribution System (WDS) Permit(s) for amendments to the California American Water Company (CAW) or for any new or amended WDS created by MPAD. Areas of District authority include hydrology/water quality and water/utilities. The District is submitting these comments based on current rules and policies which are subject to revision by action of the Board of Directors. The District has the following comments on the NOP:

MPWMD

The EIR should include a description of MPWMD. MPWMD is a California Special District whose boundaries encompass the cities of Carmel-by-the-Sea, Del Rey Oaks, Monterey, Pacific Grove, Sand City, Seaside, portions of Monterey County (primarily Carmel Valley, Pebble Beach and the Highway 68 corridor), and the Monterey Peninsula Airport District. Each of these Jurisdictions regulates land uses within its boundaries. The MPWMD does not regulate land uses. Although not a water supplier, MPWMD has power to regulate some aspect of water production and distribution by private purveyors such as CAW, which supplies water to ninety percent of the District's population, including the MPAD. One of MPWMD's responsibilities is to balance water supply and demand through the MPWMD Water Allocation Program, and to carefully track how much of the allotted water has been used by member Jurisdictions. Every applicant must receive the Jurisdiction's authorization for a specific quantity of water or sufficient Water Use Credits before applying to the District for a Water Permit. The District evaluates the project's water demand and issues a Water Permit for the project description as

depicted on the final construction plans.

Water Demand and Supply

The District has concerns about water supply and water demand for the proposed project. The Plan in the Initial Study is vague and does not provide clear details on the range of the new and expanded projects, and fails to include estimates for projected water demand. Furthermore, no details are provided regarding the source(s) of water to accommodate the proposed project, which is a critical step to confirm water availability for new development. There is no guarantee that water will be available when the permit applications for new or expanded projects are submitted. The District will respond to such requests in writing. The EIR should describe and evaluate sources of supply, project water demand, and confirm that there is adequate supply for the proposed AMP.

Water Permit Requirement

The EIR should describe MPWMD permit requirements. A Water Permit from MPWMD is required for this project. Section 9, Page 21 of the Initial Study, *Other Agencies Whose Approval is Required,* does not include MPWMD as a permitting agency. District Rule 20, *Permits Required*, states that "Any Change of Use or any expansion of a Non-Residential use requires a Water Permit." The expansion of square-footage and new construction described in the Initial Study for the AMP requires issuance of a Water Permit by MPWMD. The Non-Residential water factors are found in District Rule 24, Table 2, *Non-Residential Water Factors*. Water Permits will be required prior to undertaking this project. Prior to issuance of a building permit, a final review of the project demand will take place. Water Permits will be issued for the project if sufficient water is available.

Water Permit applications are processed in accordance with MPWMD Rules and Regulations. Current MPWMD Rules and Regulations are available at the following website: www.mpwmd.net. All Non-Residential users must comply with MPWMD's extensive water conservation and water efficiency standards (Regulation XIV, Water Conservation and Regulation XV, Expanded Water Conservation and Standby Rationing Plan). The Monterey Regional Airport Master Plan is subject to these rules and regulations prior to issuance of a Water Permit.

Water Distribution System Permit Requirement

A MPWMD Permit is also required to create or modify a Water Distribution System pursuant to Rule 20-A, unless the project meets the criteria for an exemption (Rule 20-C). MPWMD Rule 21 describes the application process, and Rule 22-B lists required findings that must be made in order for a WDS Permit to be issued.

Hydrology and Water Quality

The Initial Study findings related to Section IX-b, Hydrology and Water Quality, and Section XVII-b and -d, Utilities and Service Systems, indicates that there is a "Potentially Significant Impact" on water supplies as a result of this project. There are no details provided in this document regarding the source of water to accommodate the proposed Intensification of Use, despite current local restrictions on water use that apply to this project. Thus, the EIR should evaluate the feasibility of potential sources of supply as well as the potential effects. It is noted that MPWMD has provided a $30,000 grant to MPAD to help evaluate development of a non-

potable supply from repurposed MPAD remediation wells. It could be examined how such a supply could be used to off-set potable water use and free-up supplies for the AMP.

Moratorium on New or Expanded Water Service Connections

On March 24, 2011, the California Public Utilities Commission (CPUC) approved CAW's request for a moratorium on water service connections. This action grants CAW's moratorium request to refuse to connect new customers in certain areas of its Monterey District, and to institute a moratorium on new or expanded water service connections for projects that obtained all their necessary governmental permits after October 20, 2009. The moratorium on expanded water service connections may affect the AMP.

Thank you for your consideration of MPWMD's comments. If you have any questions or would like to discuss our comments, please contact me at 831-658-5601 or s.locke@mpwmd.net or Gabriela Ayala at gabby@mpwmd.net.

Sincerely,

Stephanie Locke
Water Demand Manager

Judi Krauss

From: Shelley Glennon <sglennon@montereyairport.com>
Sent: Wednesday, March 09, 2016 1:37 PM
To: Jim Harris; Judi Krauss
Cc: Mark Bautista; Chris Morello; Robert Talbott, Inc. - NOP AMP EIR
Subject: questions/comments

Hi Jim and Judi,

FYI, yesterday, we spoke to Bob Corliss, CEO of Robert Talbott, Inc. over the phone. He also attended one of the public workshops last year. He received the NOP package and wanted to know what the process was and if he would still have time to comment. We told him yes he would have more opportunities to comment (and the NOP AMP EIR Comment deadline was extended to March 15). He understood that this would be a long environmental planning process (approx. 2 years) in which we would analyze the potential environmental impacts in great detail.

He did mention that he was very concerned that his 53 foot long trailers would not have enough room to turn into or depart from the proposed access point to his property as shown on exhibit 7 in the initial study. The trailers go directly to the warehouse (the building to the east). While he didn't specify their actual route, he informed us that the current access point off of Highway 68 does allow for sufficient turning radius for his trailers to go in and out, but if that access point is closed off he thinks there might be an issue.

Mark and I told him that we would look into it. We do plan on taking a site visit sometime this week to take some pictures… It might be that we just move the access point south to allow for more space…but we probably should ensure Robert Talbott, Inc. that they can sufficiently maneuver their trailers to and from their warehouse from our proposed access point.

Thanks,

Shelley Glennon | Planning Manager

RE: Monterey Regional Airport CEQA
EIR/NOP Scoping Comments

Dear Ms. Glennon:

Monterey-Salinas Transit would like to provide the following comments for your consideration in preparing an Environmental Impact Report (EIR) for the proposed Monterey Regional Airport Master Plan:

- In order to encourage transit usage by employees and patrons of the Airport, roadways to/from the Airport should be designed to accommodate large transit buses, as long as 45-feet in length and 10'7" wide (with mirrors).
- Please consider designing a bus stop zone close to the entrance of the passenger terminal to encourage transit usage. Please coordinate with MST on the design of a bus stop zone.

Thank you for the opportunity to provide comments on the Notice of Preparation for the Monterey Regional Airport Master Plan. We look forward to working with you to support transit ridership to and from the Airport as a part of this planning process.

Please feel free to contact me at (831) 393-8124 or lrheinheimer@mst.org if you have any questions.

Sincerely,

Lisa Rheinheimer

Dear Ms. Glennon,

The City of Monterey appreciates and welcomes the opportunity to provide comments related to the draft Master Plan for the Monterey Peninsula Airport. The City of Monterey respectfully requests that the Monterey Peninsula Airport, through their consultants Coffman & Associates, ensure that the following issues are fully evaluated in development of the Environmental Impact Report (EIR):

1. Northside Improvements and Access:
   Existing access to the northside of the airport is currently provided by Airport Road, which traverses through the Casanova Oak Knoll residential neighborhood. The use of this road has created negative noise, vibration and congestion impacts to the residents of this neighborhood for decades. The Master Plan proposes to designate an additional 92.4 acres on the northside of the airport for expanded non-aviation uses, which would be in addition to the 8.98 acres of existing non-aviation development, which is itself proposed for redevelopment in the Master Plan. As outlined in the Initial Study, development of this area could result in the development of approximately 1,000,000 sf of light industrial, commercial, or other non-aviation building space and approximately 23 acres of pavement, parking, and landscaping. The Master Plan indicates that access to the 92.4 acre area would be from both Del Rey Gardens Drive, and from Airport Road. The City requests that the EIR carefully evaluate the proposed northside redevelopment and new northside development as it relates to construction activities, future regular access activities and stormwater runoff/retention. If the EIR determines that all possible impacts to the Casanova Oak Knoll neighborhood associated with the use of Airport Road cannot be fully mitigated, the City of Monterey requests that Del Rey Gardens Drive be the sole roadway access point to the northside of the airport for the existing and future non-aviation uses.

2. Southside Improvements and Access:
   The relocated terminal building, the new 4-story parking structure adjacent to Olmstead Road, and the various surface parking lots are proposed to be accessed via Olmstead Road and Fred Kane Drive. Additional transportation system changes include the new service drive which is proposed to be a 2-way loop road which will be as close as 150 feet from Highway 68. The City of Monterey requests that the EIR carefully evaluate the potential impacts this new service road, the parking structure and the surface parking lots will create, including but not limited to the removal of Monterey pine, Coastal Live oak trees and assorted native plants, and the visual impacts to Highway 68, a designated scenic highway.

Appropriate mitigation needs to be incorporated into the EIR to ensure that the new development does not negatively impact this section of the scenic highway.

The Master Plan also proposes to develop a 12.3 acre area on the southside of the airport, immediately adjacent to the 4-story parking structure and Highway 68 with non-aviation uses. The EIR needs to include a detailed review of the possible impacts to Highway 68, and provide a listing of those mitigations necessary to prevent any potential impacts to this section of the highway.

3. Early-Turns and Take-Offs from Runway 10R-28L:
The EIR needs to include a review of the existing early-turns and take-offs from runway 10R-28L. By allowing these new departure options, departing aircraft have created new and unanticipated noise and safety impacts to the adjacent residential neighborhoods. The City requests that the EIR evaluate these early-turns and take-offs, and if they are determined to result in negative impacts to the surrounding properties, then the Master Plan should specifically disallow these maneuvers.

Sincerely,

Clyde Roberson
Mayor

FAA FORECAST APPROVAL LETTER AND PROPOSED AIRPORT MASTER PLAN FORECASTS

U.S. Department
of Transportation
Federal Aviation Administration

Western-Pacific Region
Airports Division

San Francisco Airports District Office
1000 Marina Boulevard, Suite 220
Brisbane, CA 94005-1835

September 24, 2014

Mr. Mark Bautista
Deputy General Manager
Planning and Development Department
City of Monterey
200 Fred Kane Drive, Suite 200
Monterey, CA 93940

Dear Mr. Bautista,

RE: FAA Review of Aviation Activity Forecast; Monterey Regional Airport,
Airport Improvement Program (AIP) Project No. 3-06-0159-059

The San Francisco Airports District Office (SFO-ADO) has completed the review of the updated *Aviation Activity Forecast* document titled "Chapter Two- Forecasts" for the Monterey Regional Airport (MRY) dated May 2014. The SFO-ADO review determination is as follows:

- Concur with the aviation activity forecast methodology. The forecast assumptions presented are considered reasonable and well supported.

- Concur with the total forecasted aircraft operations and based aircraft presented in Exhibit 2R-*Aviation Demand Forecast Summary* for the five-year and ten-year forecast. Recommend updating the Airport IQ 5010 data to reflect based aircraft at the airport. Acknowledge the discrepancy between the Terminal Area Forecast (TAF) based aircraft and the document provided.

- The SFO ADO finds the subject growth rates acceptable from a planning standpoint. Accordingly, the SFO-ADO has determined that the aviation activity forecasts are consistent with the TAF. The aviation activity forecast provides adequate justification for near-term airport planning and development of the subject airport facility.

If you have any questions, please contact me at 650-827-7611.

Kind regards,

Katherine Kennedy
FAA Airports Planner

Chapter Two

FORECASTS

The definition of demand that may reasonably be expected to occur during the useful life of the Airport's key components (e.g. runways, taxiways, terminal buildings, etc.) is an important factor in facility planning. In airport master planning, this involves projecting potential aviation activity for a 20-year timeframe. Aviation demand forecasting for Monterey Regional Airport (MRY) will consider commercial passenger service projections, based aircraft projections, and aircraft operational activity projections.

The Federal Aviation Administration (FAA) has oversight responsibility to review and approve aviation forecasts developed in conjunction with airport planning studies. The FAA will review individual airport forecasts with the objective of comparing them to its *Terminal Area Forecasts* (TAF) and the *National Plan of Integrated Airport Systems* (NPIAS). It should be noted that there is almost always a disparity between the TAF and the Master Plan forecasts because the TAF forecasts do not consider local conditions or recent trends. In addition, aviation activity forecasts may be an important input to future benefit-cost analyses associated with airport development, and the FAA reviews these analyses when Federal funding requests are submitted.

As stated in FAA Order 5090.3C, *Field Formulation of the National Plan of Integrated Airport Systems* (NPIAS), forecasts should be:

- Realistic;
- Based on the latest available data;
- Reflective of current conditions at the airport (as a baseline);
- Supported by information in the study; and
- Able to provide adequate justification for airport planning and development.

Recognizing this, it is the intent to develop a Master Plan for the Airport that is based on safety and demand. As a result, the activity potential that is derived from this forecasting effort will be related to planning horizon levels (demand thresholds) rather than dates in time. The planning horizons are: short term (years 1-5), intermediate term (years 6-10, and long term (years 11-20). Specific development options, to be presented in subsequent chapters, will be tied to the airport achieving various activity thresholds.

The demand-based manner in which this Master Plan is being prepared is intended to accommodate variations in demand which can be caused by many factors, including changes in the aviation industry as well as the economy in general. Demand-based planning relates capital improvements to specific demand factors, such as based aircraft, instead of points in time. This allows the Airport to address capital improvement needs according to actual demand occurring at the Airport. Therefore, should growth in commercial passenger boarding's, aircraft operations, or based aircraft slow or decline, it may not be necessary to implement some improvement projects. However, should the Airport experience accelerated growth; the Master Plan will be flexible enough to allow for expedited development of capital projects.

In order to fully assess current and future aviation demand for the Airport, an examination of several influencing factors is needed. These include national and regional aviation trends, historical and forecast socioeconomic information of the area, and competing transportation modes and facilities. Consideration and analysis of these factors will ensure a comprehensive outlook for future aviation demand at Monterey Regional Airport.

This forecast effort was completed in the first quarter of 2014, using 2013 as the base year. Every effort has been made to utilize 2013 base year data, including related socioeconomic data such as population, employment, and income. Where actual 2013 base year data was not yet available, other sources were utilized or estimates have been made.

NATIONAL AVIATION TRENDS

Each year, the FAA updates and publishes a national aviation forecast. Included in this publication are forecasts for the large air carriers, regional/commuter air carriers, general aviation, and FAA workload measures. The forecasts are prepared to meet budget and planning needs of the constituent units of the FAA and to provide information that can be used by state and local authorities, the aviation industry, and the general public. The current edition when this chapter was prepared was FAA *Aerospace Forecasts – Fiscal Years 2014-2034*, published in March 2014. The FAA primarily uses the economic performance of the United States as an indicator of future aviation industry growth. Similar economic analyses are applied to the outlook for aviation growth in international markets. The following discussion is summarized from the FAA Aerospace Forecasts.

U.S. ECONOMIC OUTLOOK

Since the beginning of the century, the commercial air carrier industry has suffered several major shocks that have led to reduced demand for air travel. These shocks include the terror attacks of September 11, 2001, periods of rising fuel prices, and the most significant economic recession (Great Recession from 2007-2009) since the Great Depression (1929-1939). To manage this period of extreme volatility, air carriers have fine-tuned their business models with the aim of minimizing financial losses by lowering operating costs, eliminating unprofitable routes and grounding older, less fuel efficient aircraft. To increase operating revenues, carriers have initiated new services that customers are willing to purchase, and unbundled other services that were typically included in the price of a ticket such as checked bags and on-board meals. The capacity discipline exhibited by carriers and their focus on additional revenue streams bolstered the industry to profitability in 2013 for the fourth consecutive year. Going into the next decade, there is cautious optimism that the industry has been transformed from that of a boom-to-bust cycle to one of sustainable profits.

According to the FAA Forecast report, as the economy recovers from the most serious economic downturn and slow recovery in recent history, aviation will continue to grow over the long run. Fundamentally, demand for aviation is driven by economic activity. As economic growth picks up, so will growth in aviation activity. The FAA Forecast calls for passenger growth over the next 20 years to average 2.2 percent annually. In the next five years growth is anticipated to be somewhat muted, primarily due to uncertainty that surrounds the U.S. and global economies, with most growth in passengers taking place in years six through 20.

U.S. economic performance in 2013 continued to be mixed with modest growth in real GDP and real incomes, a slowly falling unemployment rate, and oil prices and consumer inflation remaining in check. The economy grew at an average annual rate of 1.6 percent in fiscal year (FY) 2013 after expanding 2.8 percent in FY 2012. Given the uncertainty that characterized 2013, it was not surprising that growth in 2013 was lower than the previous year. GDP growth accelerated throughout the year with the negative effects of Hurricane Sandy and the expiration of the temporary payroll tax cut impacting the first and second quarters. Despite the slow growth, there were some favorable signs as the housing market continued to improve, the stock market entered record territory, and the labor market saw steady but slow improvement.

One of the unique features about the economic recovery (now in its 5th year) has been the slow improvement in the nation's unemployment rate. Since 1960 there have been five economic expansions in the U.S. that have lasted longer than 48 months, including this latest expansion. On average, for the prior four expansions, the unemployment rate four years after the peak rate in the recession prior to the expansion, has declined by about one-third. If the current recovery had been similar to the prior four recoveries, the unemployment rate would be 0.6 to 0.7 points lower than the 7.5 percent in the fourth quarter of FY 2013, and 7.6 percent for all of FY 2013. The persistently high unemployment rate is

thought to be a contributing factor to the slow recovery in consumer spending and aviation demand that has been experienced since 2009.

In the medium term, (the four-year period between 2015 and 2019), U.S. economic growth is projected to average 3.0 percent per year with rates ranging between 2.9 and 3.2 percent. Income growth picks up during the same period averaging 3.2 percent per year. For the balance of the forecast period, both U.S. real GDP and real income growth slow to around 2.4 percent annually. The long-term stability of U.S. economic growth depends on sustained growth in the workforce and capital stock along with improved productivity and competitiveness.

U.S. TRAVEL DEMAND

By year end of FY 2013, the U.S. commercial aviation industry consisted of 15 scheduled mainline air carriers that used large passenger jets (over 90 seats) and 63 regional carriers that used smaller piston, turboprop, and regional jet aircraft (up to 90 seats) to provide connecting passengers to the larger carriers. Mainline and regional carriers offer domestic and international passenger service between the U.S. and foreign destinations, although regional carrier international service is confined to the border markets in Canada, Mexico, and the Caribbean. Thirty all-cargo carriers were providing domestic and/or international air cargo service at the end of 2013.

Shaping today's commercial air carrier industry are three distinct trends: (1) continuing industry consolidation and restructuring; (2) continued capacity discipline in response to external shocks, and (3) the proliferation of ancillary revenues.

The restructuring and consolidation of the U.S. airline industry that began in the aftermath of the terror attacks of September 11, 2001 continued in 2013. During the year, Southwest continued to integrate the former AirTran network into its operations as did United with the former Continental Airlines network. In 2013, American and US Airways (the third and fifth largest U.S. airlines, respectively) announced a merger agreement that, if approved, would create the world's largest airline. Consequently, when compared to 2007, 7.0 percent fewer domestic available seat miles (ASMs) were flown and 5.2 percent fewer passengers were carried domestically in 2013.

One of the most striking outcomes of industry restructuring has been the unprecedented period of capacity discipline (achieving higher passenger loads through scheduled flight and fleet mix consolidation, primarily), especially in domestic markets. Between 1978 and 2000, ASMs in domestic markets increased at an average annual rate of four percent per year, recording only two years of decline. Even though domestic ASMs shrank by 6.9 percent in FY 2002, following the events of September 11, 2001, growth resumed and by 2007, domestic ASMs were 3.6 percent above the FY 2000 level. However, since 2007, ASMs in the U.S. domestic market have decreased by 7.0 percent, as the industry responded first to the sharp rise in oil prices (up 155% between 2004 and 2008) and then the Global Recession that followed (2009 to the present).

The 7.0 percent reduction in domestic capacity since 2007 has not been shared equally between the mainline carriers and their regional counterparts. To better match demand to capacity, the mainline carriers contracted out "thin" routes to their regional counterparts because they could provide lift at a lower cost, or simply removed the capacity altogether. In 2013, the mainline carrier group provided 8.0 percent less capacity than it did in 2007 (and carried 6.6 percent fewer passengers). Capacity flown by the regional group has shrunk by 0.4 percent over the same five-year period (with passengers carried decreasing by 0.5 percent).

The most recent trend to take hold is that of ancillary revenues. Carriers generate ancillary revenues by selling products and services beyond that of an airplane ticket to customers. This includes the un-bundling of services previously included in the ticket price such as checked bags and on-board meals, and by adding new services such as boarding priority. As a result of capacity reduction and the introduction of ancillary revenue sources, U.S. passenger carriers posted net profits for the fourth consecutive year in 2013.

AIRPORT SERVICE AREA

The initial step in determining the aviation demand for an airport is to define its generalized service area for various segments of aviation. The service area is determined primarily by evaluating the location of competing airports, their capabilities, their services, and their relative attraction and convenience. In determining the aviation demand for an airport, it is necessary to identify the role of the airport, as well as the specific areas of aviation demand the airport is intended to serve. For Monterey Regional Airport, the primary civilian roles are to accommodate commercial passenger airline service, as well as general aviation demand in the region.

The service area for an airport is a geographic region from which an airport can be expected to attract the largest share of its activity. The definition of the service area can then be used to identify other factors, such as socioeconomic and demographic trends, which influence aviation demand at the airport. Aviation demand will be impacted by the proximity of competing airports, the surface transportation network, and the strength of commercial airline and/or general aviation services provided by the airport and competing airports.

As in any business enterprise, the more attractive the facility is in terms of service and capabilities, the more competitive it will be in the market. If an airport's attractiveness increases in relation to nearby airports, so will the size of its service area. If facilities and services are adequate and/or competitive, some level of aviation activity might be attracted to an airport from more distant locales.

COMPETING COMMERCIAL SERVICE AIRPORTS

The surface transportation network provides options for local travelers to use other commercial service airports in the region. Regional competing airports include Mineta San Jose International (SJC), San Francisco International (SFO), and Oakland International (OAK). Airline service factors for these airports will contribute greatly to whether a passenger will elect to use one of these regional airports instead of Monterey Regional Airport. Mineta San Jose International and San Francisco International play a significant role in passenger leakage from Monterey. Oakland International draws a small portion of its passengers from the Monterey catchment area. The following is a brief discussion of the primary competing commercial service airports. At the time of this analysis official FAA passenger data for 2013 was not available, therefore 2012 data is presented for these airports.

Mineta San Jose International Airport (SJC) is a medium hub commercial service airport which plays a significant role in passenger leakage at Monterey Regional Airport. The airport has service from 11 different carriers offering more than 32 non-stop destinations. In 2012, the airport had 4.07 million passenger enplanements. In 2012, the airport opened a new passenger terminal offering all the modern amenities that travelers have come to expect.

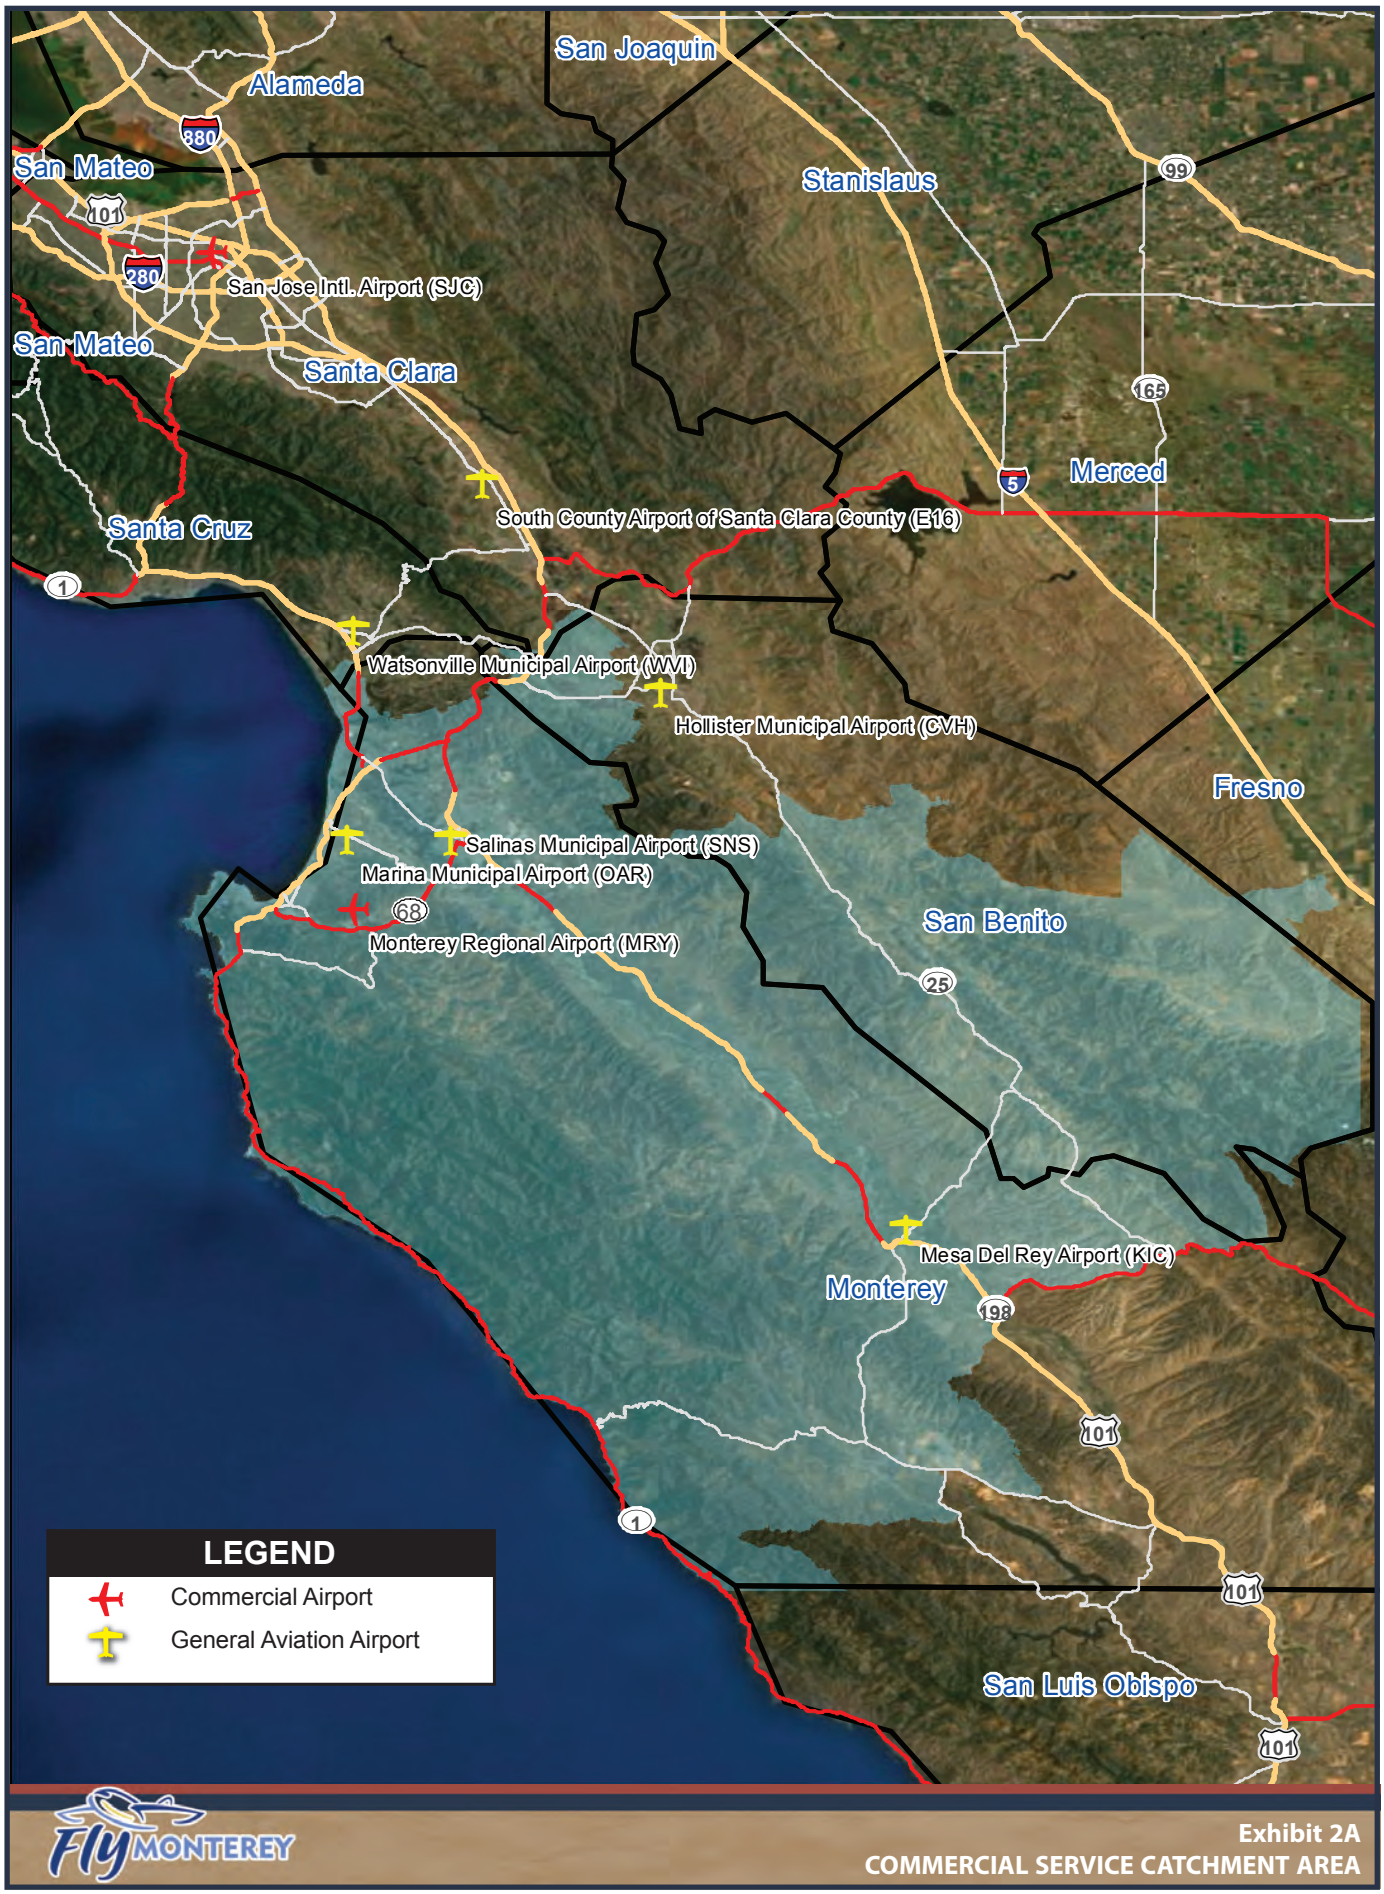
San Francisco International Airport (SFO) is a large hub commercial service airport offering service from more than 37 carriers with more than 50 non-stop destinations, including destinations in Europe and Asia. In 2012, the airport had more than 21.28 million passenger enplanements.

Oakland International Airport (OAK) is a medium hub commercial service airport offering 11 carriers and 50 non-stop or direct flights. In 2012, the airport experienced an 8.19 percent increase in passenger enplanements over the previous year. There were nearly five million enplanements in 2012.

COMMERCIAL SERVICE CATCHMENT AREA

The administration of the Airport monitors and maintains information regarding air service. In 2008, the Airport conducted a *Passenger Demand Analysis* and in 2011, portions of this study were updated in the *True Market Analysis* study of commercial service activity.

According to the *Passenger Demand Analysis* report, the primary catchment area represents the population of travelers who should use Monterey Regional Airport based on the shortest drive time to a commercial service airport. **Exhibit 2A** identifies the commercial service catchment area for the Airport as defined in the *Passenger Demand Analysis* (2008) study. The catchment area had an estimated 2012 population of 405,152 residents.



Source: Passenger Demand Analysis (2008)

Factors Affecting Air Service

An airport's commercial airline passenger service area is influenced by several factors, with competing transportation modes playing a key role. The higher the level of competing factors, the less likely an airport is to capture a large percentage of its service area passengers. This is especially true for regionalized commercial service airports offering limited airline services. Some factors affecting the ability of an airport to retain passengers include flight schedules, airfares, non-stop service offered at competing airports, travel time to competing airports, and the quality and capacity of air service offered by competing airports.

The first consideration for determining the Airport's commercial service area is an examination of the level of commercial services available at the Airport. Levels of service factors that typically shape the market share within a service area include frequency of service, number of airlines, type of aircraft utilized, and non-stop destinations available.

As of February 2014, Monterey Regional Airport had scheduled service from five different carriers: United Express, American Eagle, US Airways, Alaska, and Allegiant. United Express is the most active at the Airport offering eight daily departures. Of this total, four are to San Francisco International, three to Los Angeles International, and one to Denver International. The flights to San Francisco International utilize the 27-seat Embraer Brasilia, a twin-engine turboprop aircraft. The flights to Los Angeles International and Denver International utilize the 50-seat CRJ200.

American Eagle offers three daily departures to Los Angeles International utilizing the 50-seat CRJ 200 regional jet. US Airways offers three daily departures to Phoenix Sky Harbor International utilizing the CRJ200. Alaska Air offers one flight per day to San Diego International utilizing the 76-seat Q-400 twin turboprop aircraft. Finally, Allegiant provides twice weekly departures to Las Vegas McCarran International utilizing the 150/166 seat MD-80 aircraft. **Exhibit 2B** presents the flight schedule for these airlines as of February 2014. Republic Airlines provides non-scheduled charter service to Laughlin and Reno, Nevada for gambling trips.

The type of aircraft utilized can influence a passenger's decision of which airport to depart. Passenger preference surveys have shown that jet service is desirable. Airline reliability also needs to be factored for commercial service potential at Monterey Regional Airport. Typically, passengers with fixed schedules, primarily business travelers, may elect not to risk the chance of missing a flight due to a mechanical, weather, or scheduling conflict, instead opting for other transportation modes or other airports.

Ticket pricing is a significant factor for travelers when deciding which airport to originate from. According to the *Passenger Demand Analysis* (2008) study, when considering the top 25 destinations for travelers within the catchment area, average airfares were higher than those from Mineta San Jose International or Oakland International. Relative to San Francisco International, Monterey Regional Airport had a higher average fare in 18 of the top 25 markets. The overall average fare for calendar year 2007 was $83 higher than for flights from Mineta San Jose International or 37.0 percent higher. Flights from Monterey Regional

Airport were $10 higher than from San Francisco International or 4.5 percent higher. As compared to Oakland International Airport fares were $98 higher or 44.0 percent higher.

The driving distance, potential congestion, and parking rates can influence traveler decisions on which airport to depart from. The drive from the Monterey area to Mineta San Jose International is 77 miles and is estimated to take approximately an hour and a half. The drive from Monterey to San Francisco International is 101 miles and is estimated to take two hours. The drive from Monterey to Oakland International is 106 miles and is estimated to take two hours. Parking fees is another factor which increases the cost of driving versus flying from Monterey Regional Airport. The cost of driving to the Bay area for airline service can be high for a single passenger, but much lower if a family or group is traveling together.

According to the *True Market Analysis* (2011) study, Monterey Regional Airport captures approximately 40 percent of the air travelers who purchase tickets within the catchment area of the Airport; Mineta San Jose International captures 33 percent, San Francisco International captures 24 percent, and Oakland International captures the remaining three percent.

Top 25 Origin and Destination Markets

The U.S. Department of Transportation (DOT) maintains a rolling quarterly survey of 10 percent of all airline tickets sold for each commercial service airport. This Origin & Destination (O&D) Survey provides information on passengers' starting and ending cities and shows the volume of traffic between city pairs. The figures do not include "through" connecting/transfer passengers.

Information obtained from the O&D Survey for calendar year 2012 provides final destinations for those traveling from Monterey Regional Airport. This information is typically useful in determining if additional airline service is feasible by another carrier or by the same carrier offering additional destinations/connections from the airport. **Exhibit 2C** provides a depiction of the top 25 O&D markets based on the survey information. It also shows the top 25 markets in 2003 for comparison purposes.

In 2012, the top destination of passengers departing from Monterey Regional Airport was Los Angeles, accounting for 17.03 percent of all passengers. Next was Las Vegas, which accounted for 8.35 percent of passengers. The top five was rounded out by San Diego (7.38 percent), Phoenix (6.67 percent), and Washington, D.C. (6.04 percent). A total of 76.63 percent of all passenger enplanements are destined for one of the top 25 markets.

By comparison, in 2003, the top destination for passengers departing from Monterey Regional Airport was Washington, D.C., which was 8.71 percent of the passengers. Los Angeles was second with 7.81 percent, followed by Phoenix (6.91 percent), New York (5.14 percent), and Chicago (4.49 percent).

GENERAL AVIATION SERVICE AREA

General aviation is the term used to describe a diverse range of aviation activities which includes all segments of the aviation industry, with the exception of commercial air carriers and military. General aviation is the largest component of the national aviation system and includes common activities such as pilot training, recreational flying, agricultural applications, medical support, and other business and corporate uses. General aviation aircraft can range from small glider and single engine aircraft to large turboprop and jet-powered aircraft. In fact, some larger commercial airline aircraft models such as the Boeing 737, known as the Boeing Business Jet (BBJ), have been converted to private general aviation uses. Many retired military aircraft are now in service with general aviation functions.

The service area for the general aviation component is heavily influenced by the proximity of an airport to an aircraft owner's home or business, as well as the level of service available at competing airports. A description of airports within an approximate 30-nautical mile radius of Monterey Regional Airport was discussed in Chapter One. This included Marina Municipal Airport, Salinas Municipal Airport, Watsonville Municipal Airport, and Hollister Municipal Airport.

Monterey Regional Airport's location in the northwest portion of the county, adjacent to the City of Monterey, makes it an important facility serving the needs of general aviation users in Monterey County. Existing Airport facilities, including the 7,000+ -foot long primary runway, precision instrument approach capabilities, high quality aviation service providers, and hangar space, places the Airport as a premier general aviation option. No other airport in the immediate region can match the general aviation facilities and services provided at Monterey Regional Airport, especially for business jet operators.

When discussing the general aviation service area, another primary demand segment that needs to be addressed is an airport's ability to attract based aircraft. As long as reasonably priced hangars and aviation services are offered, most aircraft owners and operators will choose to base at an airport near their home or business. As a result, the general aviation service area will tend to be more compact than a commercial service area. The corporate aviation component (typically turboprops and business jets) of the service area can extend a bit further depending on the capabilities of competing airports.

For planning purposes, the primary general aviation service area for Monterey Regional Airport will be the northern portion of Monterey County. This service area will overlap somewhat with the service areas for both Marina Municipal Airport and Salinas Municipal Airport. For users of corporate aviation (turboprops and business jets), the service area is considered somewhat larger and may extend to the extent of the commercial service catchment area. **Exhibit 2D** identifies the general aviation service areas.

SOCIOECONOMIC FORECASTS

The socioeconomic conditions for the area provide an important baseline for preparing aviation demand forecasts. Local socioeconomic variables, such as population, employ-

ment, and income are indicators for understanding the dynamics of the county and, in particular, the trends in aviation growth. Socioeconomic data for the area has been utilized in various statistical analyses to develop forecasts of aviation demand for the Monterey Regional Airport. **Table 2A** presents historical trends and forecasts for population, employment, and income for both Monterey County and the State of California.

Source Employment and Income Historic and Forecast: Woods & Poole Economics - Complete Economic Demographic Data Source (CEDDS-2013)

The population in Monterey County has shown steady growth since 2000, growing from 401,762 to an estimated 421,494 in 2013. Population is forecast to continue to grow steadily at an annual rate of 0.81 percent. By 2033, the population is forecast to reach 487,324. The population growth in California is forecast to exceed that of the county on an annual rate.

Employment for Monterey County is forecast to grow at 1.43 percent from 2013 through 2033. Growth for the county is forecast to be slightly less than that forecast for the state as a whole (1.61 percent). Per Capita Personal Income is forecast to grow 1.60 percent annually from 2013 through 2033. This is nearly the same as that projected for the State of California (1.64 percent) over the same timeframe.

Employment and income for both the state and the county are forecast to grow at a higher rate over the next 20 years as compared to the period from 2000 through 2010. During the first decade of this century, employment in Monterey County grew at 0.06 percent and 0.16 percent in the state. Income for the county grew at 0.43 percent and 0.29 percent for the state.

GENERAL AVIATION SERVICE AREA

The draft Association of Monterey Bay Area Governments (AMBAG) *Regional Growth Forecast* was consulted to identify any significant differences from the primary data sources utilized. The primary data sources are the California Department of Finance for population and Woods & Poole Economics for employment and income. For population, the 2010 figures are identical and the 2033 figures are within 0.007 percent. There is a variance in employment numbers; however, the Woods & Poole Economics data presents both historical trends and forecast years, providing a consistency of data. Income data is not included in the AMBAG forecasts; therefore, the Woods & Poole data is utilized.

FORECASTING APPROACH

The development of aviation forecasts proceeds through both analytical and judgmental processes. A series of mathematical relationships is tested to establish statistical logic and rationale for projected growth. However, the judgment of the forecast analyst, based upon professional experience, knowledge of the aviation industry, and assessment of the local situation, is important in the final determination of the preferred forecast.

The most reliable approach to estimating aviation demand is through the utilization of more than one analytical technique. Methodologies frequently considered in the aviation industry include trend line projections, correlation/regression analysis, and market share analysis. By developing several projections for each aviation demand indicator, a reasonable planning envelope will emerge. The selected forecast may be one of the individual projections or a combination of several projections based on local conditions. The selected forecast will almost always fall within the planning envelope. Some combination of the following forecasting techniques is utilized to develop the planning envelope for each demand indicator.

Trend line projections are probably the simplest and most familiar of the forecasting techniques. By fitting growth curves to historical demand data, then extending them into the future, a basic trend line projection is produced. A basic assumption of this technique is that outside factors will continue to affect aviation demand in much the same manner as in the past. As broad as this assumption may be, the trend line projection does serve as a reliable benchmark for comparing other projections.

Correlation analysis provides a measure of the direct relationship between two separate sets of historic data. Should there be a reasonable correlation between the data, further evaluation using regression analysis may be employed.

Regression analysis measures the statistical relationship between dependent and independent variables, yielding a "correlation coefficient." The correlation coefficient (Pearson's "r") measures associations between the changes in a dependent variable and independent variable(s). If the r-squared (r^2) value (coefficient determination) is greater than 0.90, it indicates good predictive reliability. A value below 0.90 may be used with the understanding that the predictive reliability is lower.

Market share analysis involves a historical review of aviation activity as a percentage, or share, of a larger regional, state, or national aviation market. A historical market share trend is determined providing an expected market share for the future. These shares are then multiplied by the forecasts of the larger geographical area to produce a market share projection. This method has the same limitations as trend line projections, but can provide a useful check on the validity of other forecasting techniques.

It is important to note that forecasts will age and the further one is from the base year the less reliable a forecast may become, particularly due to changing local and national conditions. Nonetheless, the FAA requires that a Master Plan include a 20-year forecast for the airport. Facility and financial planning usually require at least a ten-year view, since it often takes more than five years to complete a major facility development program. However, it is important to use forecasts which do not overestimate revenue-generating capabilities or understate demand for facilities needed to meet public (user) needs.

A wide range of factors is known to influence the aviation industry and can have significant impacts on the extent and nature of air service provided in both the local and national markets. Technological advances in aviation have historically altered, and will continue to change, the growth rates in aviation demand over time. The most obvious example is the impact of jet aircraft on the aviation industry, which resulted in a growth rate that far exceeded expectations. Such changes are difficult, if not impossible, to predict, and there is simply no mathematical way to estimate their impacts.

Using a broad spectrum of local, regional, and national socioeconomic and aviation information and analyzing the most current aviation trends, forecasts are presented for the following demand indicators:

- COMMERCIAL PASSENGER SERVICE
  - Annual Enplaned Passengers
  - Operations and Fleet Mix

- COMMERCIAL AIR CARGO
  - Enplaned Tons

- GENERAL AVIATION
  - Based Aircraft
  - Based Aircraft Fleet Mix
  - Local and Itinerant Operations

- AIR TAXI AND MILITARY
  - Local and Itinerant Operations

- PEAKING CHARACTERISTICS
  - Airline Enplanement Peaks
  - Operations Peaks

COMMERCIAL PASSENGER SERVICE FORECASTS

To determine commercial service potential at Monterey Regional Airport and the facilities necessary to properly accommodate present and future airline activity, two basic elements must be forecast: annual enplaned passengers and annual airline operations. Annual enplaned passengers serve as the most basic indicator of demand for commercial passenger service activity. The combination of enplanements and deplanements would approximate the total passengers using the airport. The annual number of enplanements is the figure utilized by the FAA to determine entitlement funding levels for the airport.

The term "enplanement" refers to a passenger boarding an airline flight. Enplaning passengers are then described in terms of either "originating" or "connecting/transferring." Originating passengers depart a specific airport for a destination or hub airport to connect/transfer to another flight. Connecting/transferring passengers are those who have departed from another location and are using the airport as an intermediate stop. These passengers may disembark their originating flight to wait in the terminal for their next flight or could simply remain on the aircraft at an intermediary stop as a "through" passenger. Monterey Regional Airport and airports similar to it tend to have mostly originating passengers, while larger hubs like those in Denver, Chicago, and Dallas could have a majority of passengers who are connecting/transferring.

An important resource utilized in aviation demand forecasting is the annual FAA aviation forecasts. The most recent available version is *Aerospace Forecasts – Fiscal Years 2014-2034*, published in March 2014. The FAA forecasts a variety of aviation demand indicators on an annual basis. In the most current edition, fiscal year 2012 is presented as the baseline, with 2013 shown as an estimate. Years 2014 through 2034 are projections. Many forecasting elements utilized in this analysis will consider the history and projections presented by the FAA in its annual forecast.

FAA COMMERCIAL AIR CARRIER FORECASTS

Although the recession has been officially over for several years, in 2013 carriers continued to deal with economic uncertainties as business travel budgets remained strained, unemployment persisted and uncertainty surrounding federal fiscal policy (expiration of the payroll tax break in January, sequestration, and a partial shutdown of the federal government) remained. In such as uncertain economic environment, industry capacity growth was restrained (up 0.8 percent in 2013), after only a 0.1 percent increase in 2012. Given the minimal increase in seats available to the traveling public, carriers were still able to raise airfares despite the slow growth in demand. Higher airfares and ancillary revenue, coupled with flat to falling fuel prices resulted in U.S. carriers being profitable in 2013.

The FAA provides several measures for commercial airline activity in its *Aerospace Forecasts – Fiscal Years 2014-2034*. After experiencing slight growth in 2013 (up 0.8 percent), domestic system capacity (as measured in available seat miles – ASMs) was projected to increase 1.0 percent in 2014. From 2013 through 2034 domestic ASMs are projected to

grow 2.0 percent annually. Mainline carrier capacity is forecast grow 0.8 percent in 2014 and 2.0 percent through 2034. Regional carrier capacity grew by 2.2 percent and is forecast to grow 2.3 percent annually through 2034. Overall domestic capacity is projected to increase at an average annual rate of 2.1 percent through 2034, which is slightly slower that economic growth.

The FAA forecasts indicate that enplanements are forecast to grow slightly (up 0.6 percent) in 2014, following a 0.1 percent increase in 2013. Over the forecast period, domestic enplanements are projected to grow at an average annual rate of 1.9 percent, with mainline carriers growing at the same rate (1.9percent). **Exhibit 2E** presents the annual historical and forecast enplanement totals for both large air carriers and commuter airlines in the U.S. as forecast by the FAA.

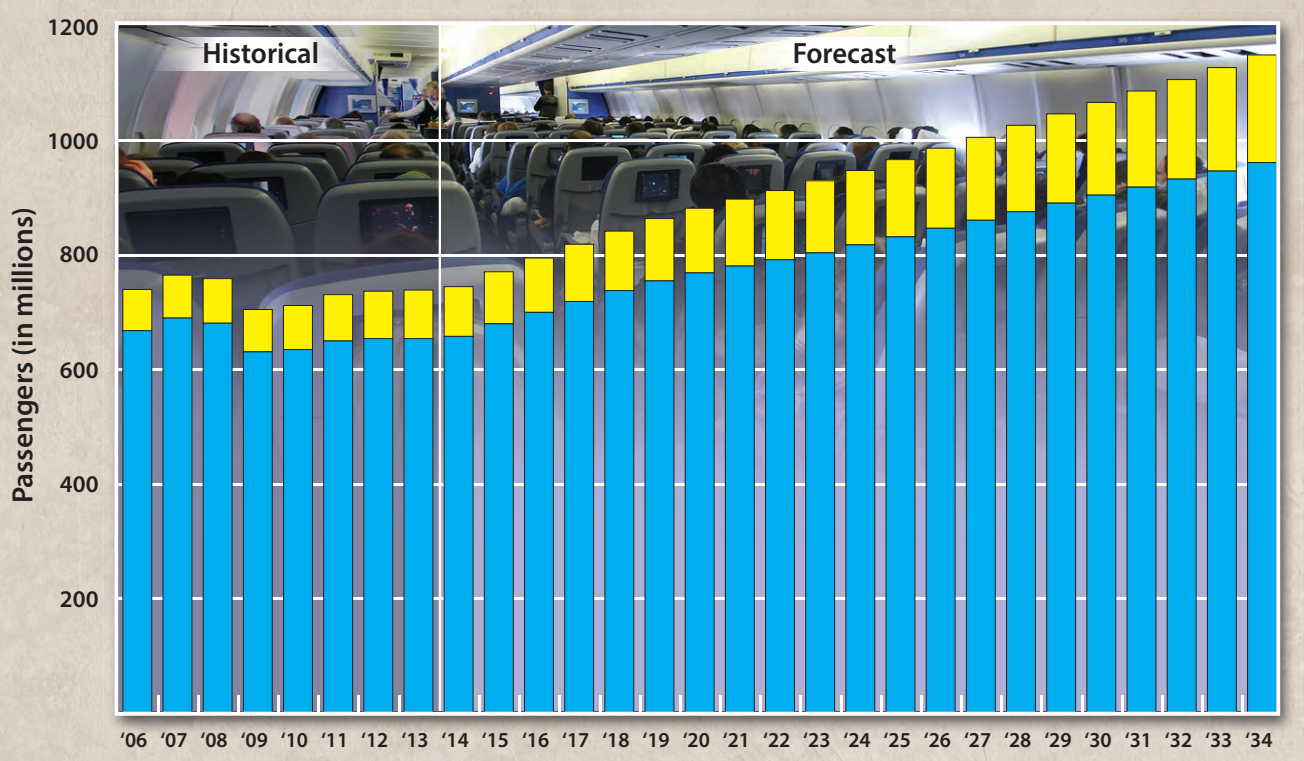
FAA COMMERCIAL AIRCRAFT FLEET FORECAST

The commercial passenger carrier fleet is undergoing transformation. The mainline carriers are retiring older, less fuel efficient aircraft (e.g. 737-300/400/500, 757/767, and MD-80) and replacing them with more technologically advanced A319/320 and 737-700/800/900 aircraft. The regional carriers are growing their fleet of 70-90 seat regional jet aircraft and reducing their fleet of 50-seat jet aircraft. The total number of aircraft in the U.S. commercial fleet (including regional carriers) is estimated at 6,727 for 2013, a decrease of 184 aircraft from 2012. This includes 3,774 mainline air carrier passenger aircraft (over 90 seats), 740 mainline air cargo aircraft and 2,213 regional carrier aircraft (jets, turboprops, and pistons).

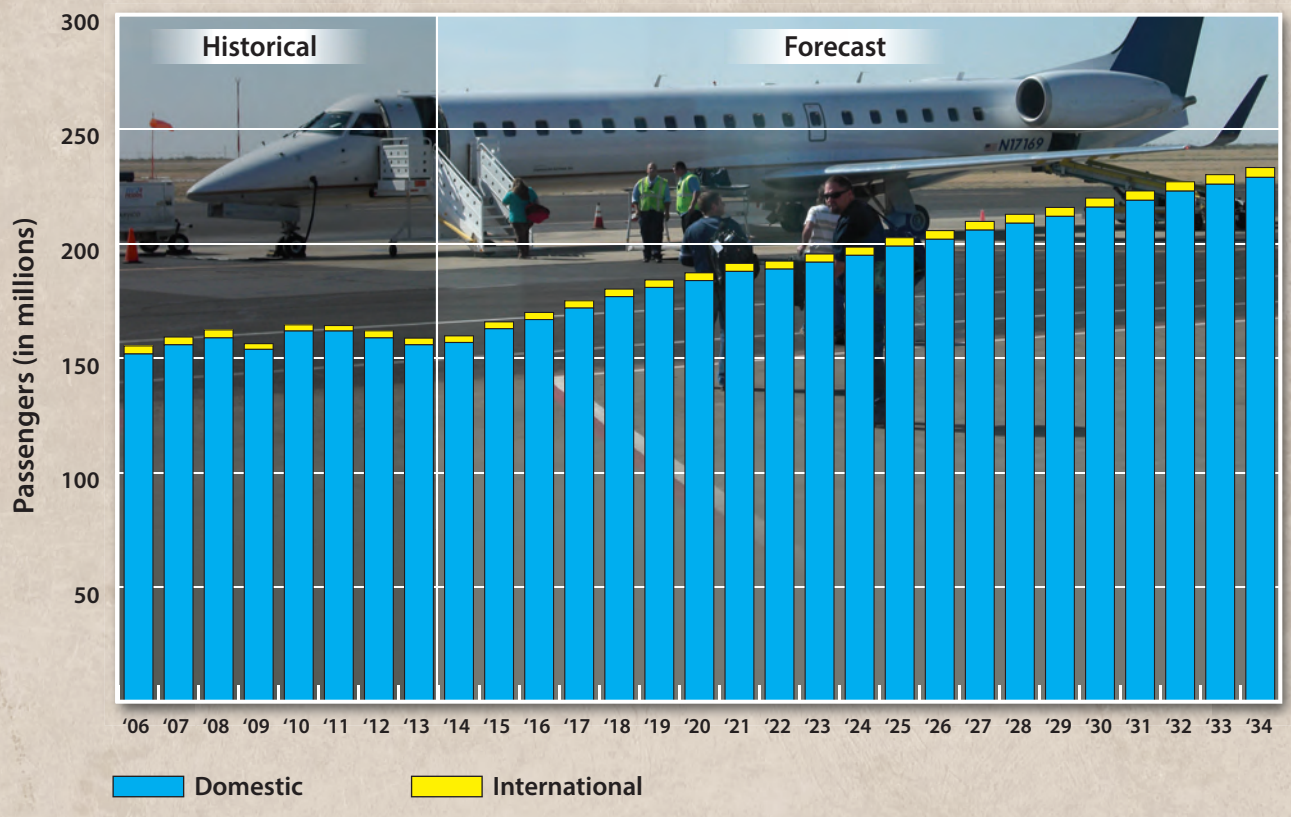
The number of passenger jets in the mainline fleet is estimated to have increased by 41 in 2013. After 2013, the mainline aircraft fleet was projected to add approximately 65 aircraft annually, totaling 5,112 aircraft in 2034. The mainline narrow-body fleet (including the Embraer 190s) was projected to grow by 42 aircraft annually from 2013-2034. The wide-body fleet (including the Boeing 787 and Airbus A-350) was projected to grow by 23 aircraft annually over the same period. Mainline passenger jet aircraft are forecast to increase 1.5 percent annually through 2034.

The regional passenger aircraft fleet is estimated to have decreased by 127 aircraft in 2013, as decreases in 50-seat and smaller regional jets and turboprops outpace production of new larger regional jets. After 2013, the regional carrier fleet (turboprops and jets) is expected to decrease by 0.1 percent per year over the remaining years of the forecast period, totaling 2,141 aircraft in 2034. The number of regional jets (90 seats or fewer) is projected to grow from 1,642 in 2013 to 1,953 in 2034, an average annual increase of 0.8 percent. All of the growth in regional jets over the forecast period occurs in the larger, 70- to 90-seat aircraft category. During the forecast period, all regional jets of 50 or less seats are projected to be retired from the fleet.

U.S. Scheduled Commercial Air Carrier Passenger Enplanements



U.S. Regional / Commuter Scheduled Passenger Enplanements



Source: FAA Aerospace Forecasts, Fiscal Years 2014-2034

FLY MONTEREY

Exhibit 2E
U.S. COMMERCIAL AIR CARRIER AND REGIONAL/COMMUTER FORECASTS

The commercial turboprop/piston fleet was expected to shrink from 571 units in 2013 to 188 in 2034. Turboprop/piston aircraft are expected to account for just 8.8 percent of the regional carrier passenger fleet in 2033, down from a 25.8 percent share in 2013.

Large cargo jet aircraft are forecast to grow from an estimate of 740 in 2013 to a total 1,182 aircraft in 2034. The narrow-body, cargo jet fleet is projected to increase by five aircraft per year over the 20-year forecast period as older 757s and 737s are converted to cargo service. The wide-body, cargo jet fleet is projected to increase by 18 aircraft yearly.

The FAA forecast of commercial aircraft in the U.S. fleet is presented on **Exhibit 2F**.

HISTORICAL COMMERCIAL PASSENGER ACTIVITY

Historical passenger enplanements at Monterey Regional Airport from 1986 through 2013 are presented on **Exhibit 2G**. The same information, with annual percentage rate change, is presented in **Table 2B**. This timeline is significant in that it documents most of the enplanement activity at the Airport since the U.S. airline industry was deregulated in the late 1970s.

The Airport reached more than 275,000 enplanements in 1987. Enplanements declined slightly from 1988 through 1993, the end of which coincided with a recessionary period from July 1990 through May 1991 and also coincided with the coming closure of nearby Fort Ord in 1994. The latter half of the 1990s saw substantial increases in enplanements, culminating with more than 258,000 enplanements in 1999. This period coincided with the longest period of economic growth in American history.

The end of the 1990s saw the collapse of the speculative dot-com bubble, a fall in business outlays and investments, and the subsequent terrorist attacks of September 11, 2001. This recessionary period, which lasted from March to November 2001, was relatively shallow, but enplanements dipped to only 176,000 in 2002. Moderate growth resumed and the Airport saw steady enplanement growth through 2007 when there were 215,797 enplanements. The Great Recession extended from De-

cember 2007 through June of 2009 officially, and the recovery has been slow. By 2011, enplanements had dipped to 181,640. Over the last three years, the economic recovery seems to have taken effect with enplanement figures reaching 196,268 for 2012 and then over 200,000 in 2013.

Table 2C presents annual passengers, which includes scheduled and non-scheduled flights and revenue and non-revenue passengers by airline for 2003, 2008, and 2013. In 2003, the Airport's market was dominated by United Airlines/SkyWest, its regional carrier, with 62.4 percent of the market. In 2013, SkyWest continued to maintain the largest market share; however, its share has currently dropped to 41.0 percent. US Airways (20.6%), American Eagle (19.3%), Alaska/Horizon (9.7%), and Republic (0.6%) combine to account for the remaining market share at the Airport in 2013.

TABLE 2C
Annual Total Passengers by Airline
Monterey Regional Airport

	2003		2008		2013	
	Passengers	% of Total	Passengers	% of Total	Passengers	% of Total

Monthly Passenger Distribution

Table 2D presents the monthly passenger enplanement levels for the Airport from 2003 through 2013. Consistently, the Airport realizes its busiest activity during the summer and into early fall. On average, the peak month has represented 9.6 percent of annual enplanements.

Exhibit 2H illustrates the monthly moving total airline enplanements from 2007 through 2013. As can be seen, the 12-month moving enplanement totals over the last seven years have followed a predictable trend with summers being busier than winters. The exhibit also shows the trend in revenue passengers over the same period. Revenue passenger data can be important to airlines for analysis of the sustainability of various routes.

ENPLANEMENT FORECAST

As discussed in this chapter's introduction, the first step involved in updating an airport's forecasts include reviewing previous forecasts in comparison to actual activity to determine what changes, if any, may be necessary. After that comes the consideration of the effects of any potential new factors that could impact the forecasts, such as changes in the socioeconomic climate or the effects of changes in air carrier services.

Previous Enplanement Forecasts

There are three existing forecasts of enplanement activity at Monterey Regional Airport to consider: the 1992 Master Plan forecasts, the forecasts developed for use in the 14 CFR Part 150 Noise Exposure Map Update (2008), and the 2014 FAA *Terminal Area Forecast* (TAF). The 1992 Master Plan enplanement forecast is over 20 years old and does not take into consideration recent aviation trends. Therefore, the forecasts from the 1992 Master Plan are considered outdated and are not utilized in this analysis.

In 2008, the Airport updated their noise exposure maps as part of a larger sound insulation program. Enplanement forecasts were developed as part of this effort. As of 2014, these forecasts are eight years old. When compared to the actual enplanement trends at the Airport, the NEM enplanement forecast appears to be outdated and may not provide useful information for analysis today.

The FAA TAF forecast is published annually and is utilized by the FAA as a starting point for considering the reasonableness of master plan forecasts. **Table 2E** presents the FAA TAF as published in January 2014 and the 2006 Part 150 NEM enplanement forecasts (which

Note: The Part 150 NEM study utilized the 2008 FAA TAF figures (rounded to nearest 1,000); figures interpolated and extrapolated to plan years.

Regression Enplanement Forecasts

A time-series extrapolation and regression analyses using multiple variables, including aviation and socioeconomic factors, were conducted. It is optimal to have an "r^2" value near or above 0.90, which would represent a very strong correlation and statistical reliability. The results of the regression analysis did not provide values near the 0.90 indicator. This is not surprising as historical enplanements have fluctuated, while comparative variables have followed relatively steady growth rates. As a result, the regression trends will no longer be considered in this analysis.

Travel Propensity Factor

There are a variety of local factors that affect the potential for passengers within an area. A key statistic to consider is the relationship of the airport's enplanements levels to the populace it serves. The ratio of enplanements to population is termed the Travel Propensity Factor (TPF). **Table 2F** presents a historical review of the TPF for Monterey Regional Airport since 1990.

The TPF is predominantly impacted by the proximity of an airport to other regional airports with higher levels of service or "hub" airports. Regional airports with higher TPF ratios tend to be located farther from hub airports in relatively isolated areas. These airports generally have a service area that extends into adjacent, well-populated regions or have some type of air service advantage that attracts more of those passengers that might otherwise choose to drive to a more distant hub airport. Generally, the higher the TPF, the more likely air travelers are to utilize the local airport for commercial service.

As can be seen in the table, the TPF has generally trended with the condition of the national economy. In 1990, when the economy was growing, the Airport experienced approximately 0.6746 enplanements per resident of Monterey County. This ratio declined to 0.5453 by 1995, a period following a recession. By 2000, the TPF had increased to 0.5860, a time when the economy was growing substantially. The recession and the terrorist attacks of

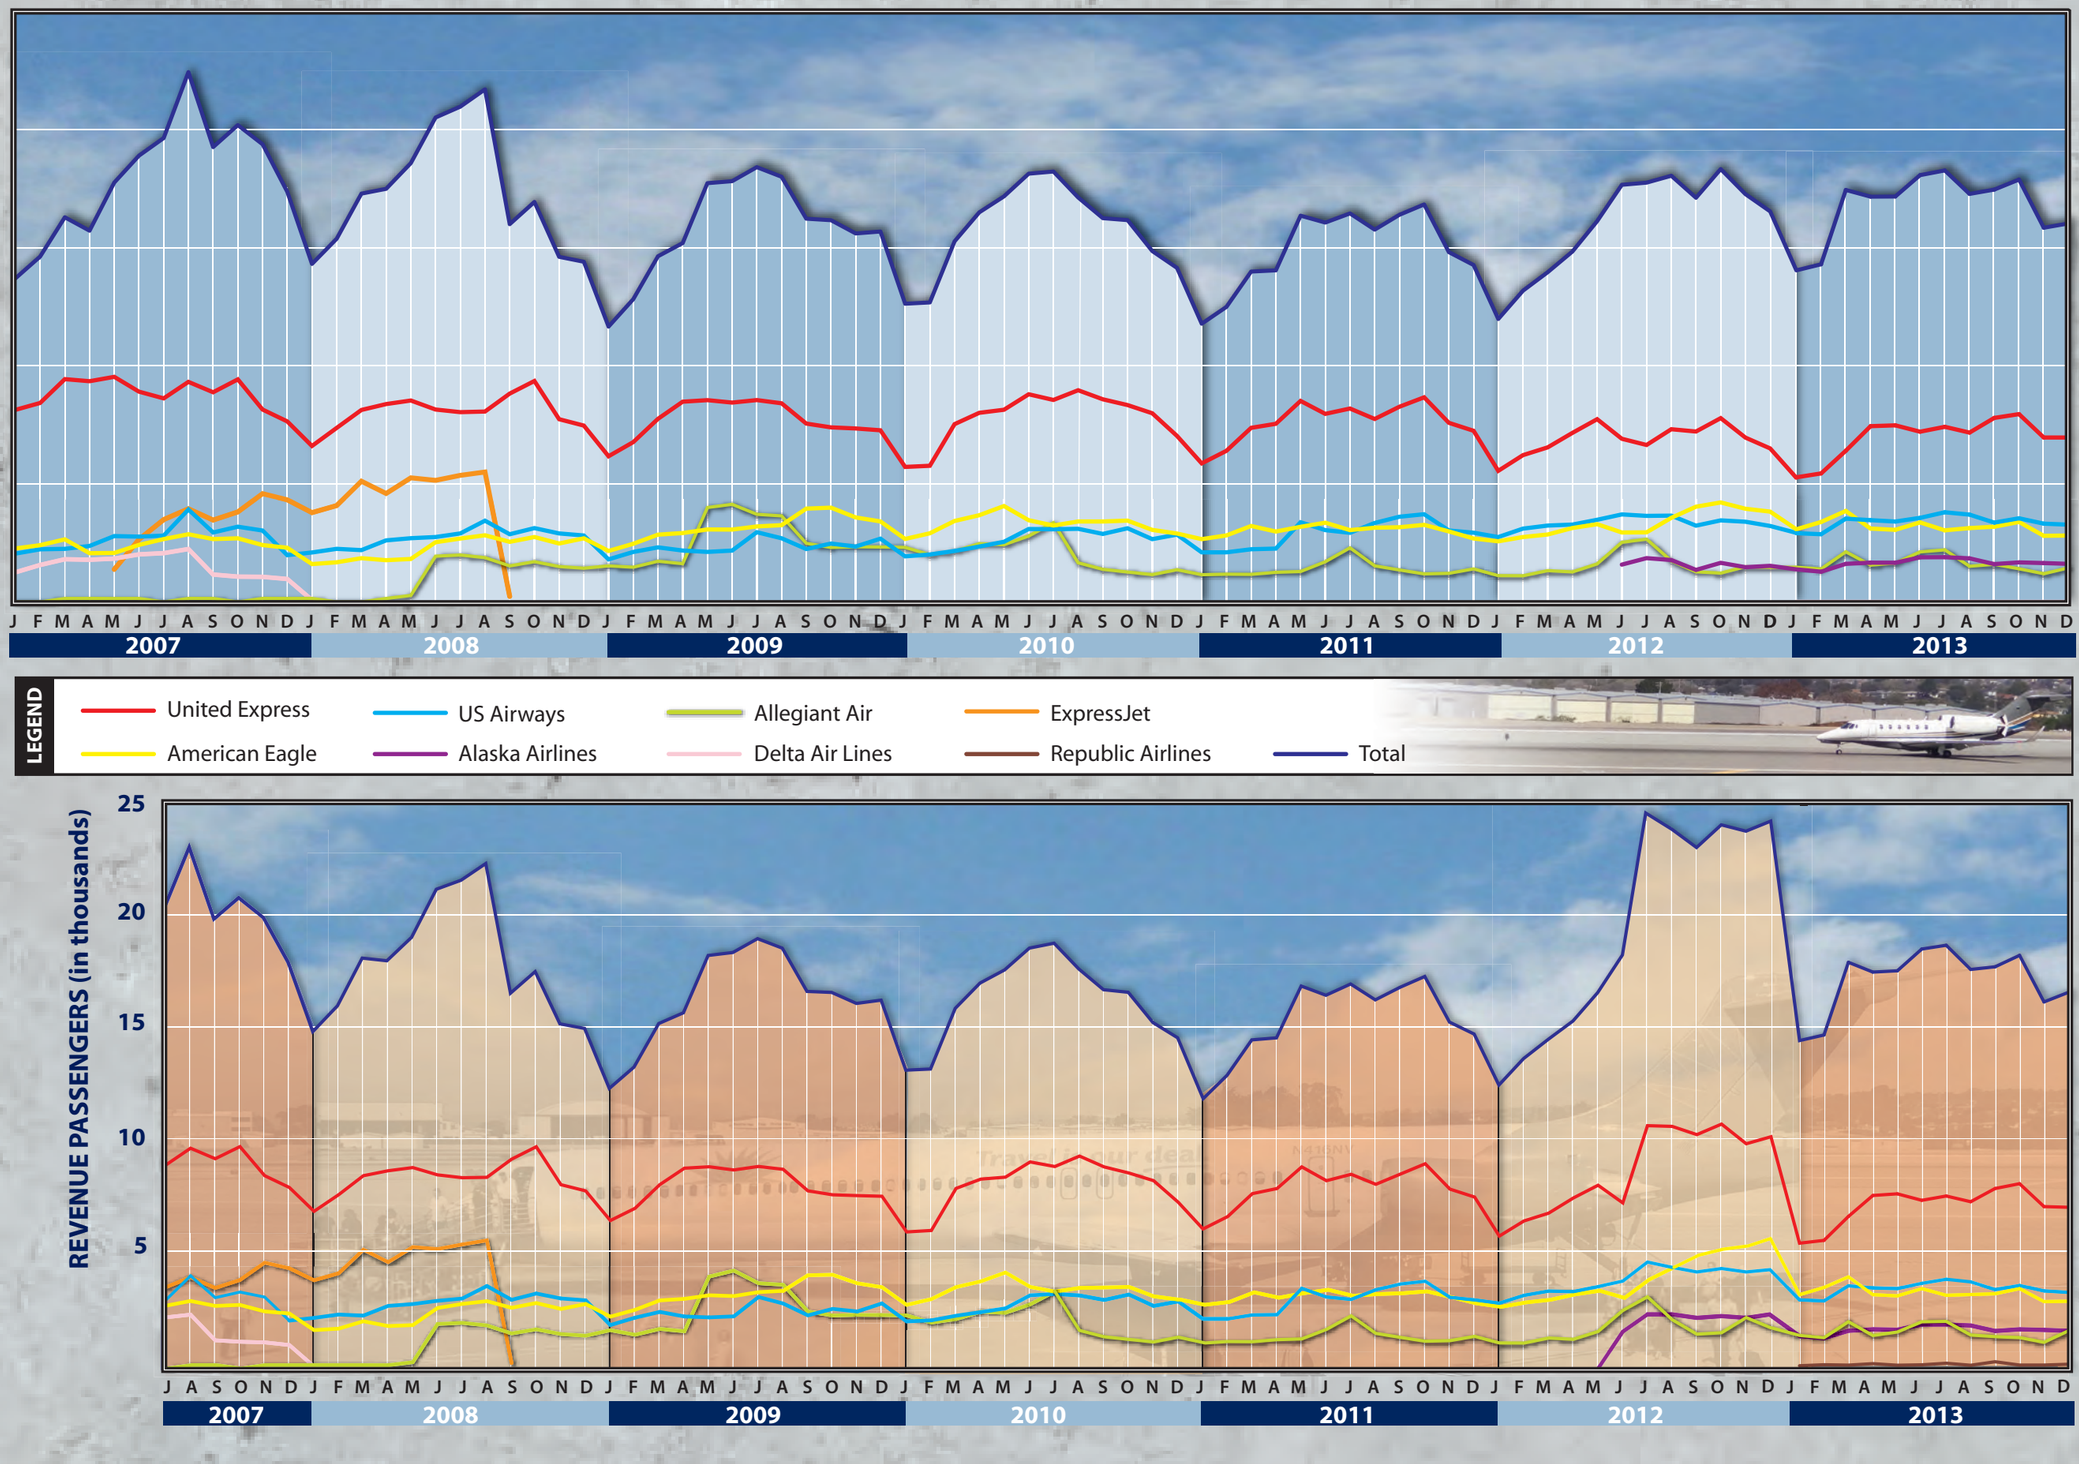

Exhibit 2H
12-MONTH MOVING TOTALS ENPLANEMENTS AND PASSENGERS

This page intentionally left blank

September 11 are reflected in a decreasing TPF for the Airport. By 2007, the TPF had increased again, coinciding with the steady economic growth occurring from 2002 through 2007. As would be expected, the TPF decreased again to coincide with the Great Recession of 2008-2009. The previous two years, 2012 and 2013, realized an increase in TPF as the economy began to grow again.

TABLE 2F
Historical Travel Propensity Factor
Monterey Regional Airport

Year	Monterey Regional Airport Enplanements[1]	Monterey County Population[2]	Travel Propensity Factor
1990	239,914	355,660	0.6746

For comparison purposes, those markets with 2012 (most recent available from the FAA) enplanement figures similar to Monterey Regional Airport were examined for their relative TPF. This analysis is presented in **Table 2G**. Each of these markets is served by an airport with scheduled commercial service, but is somewhat regionalized. Most of the airports are located within a manageable driving distance to a larger hub airport, while some are located farther distances from a major hub airport. Aspen, Colorado might be considered an outlier since this is clearly a tourist destination with a low population compared to the number of enplanements.

TPF: Travel Propensity Factor
Enp.: Enplanements
Source: Enplanements from FAA ACAIS database; MSA Population from Woods & Poole CEDDS data.

Of the 12 markets shown, 10 had growing or relatively flat TPFs from 2002 to 2012. This includes Monterey Regional Airport, which saw growth in its TPF. Only two saw significant decreases in TPF. The most common reason for movement in the TPF, other than the general condition of the economy, is the level of service provided by airlines. Generally, more flights to more destinations will help increase the TPF.

Two enplanement forecasts, developed utilizing the TPF, are shown in **Table 2H**. The first forecast considers the Airport maintaining a constant share of the 2013 TPF (0.4760). This forecast results in 231,989 enplanements by 2033. The last time the Airport reached this level of enplanements was in 2000, when there were 235,430. The 2000 enplanement level followed a period of sustained growth nationally. If such a sustained growth period were to return, then an increasing TPF might be considered.

TABLE 2H
Enplanement Projection Based on Travel Propensity Factor (TPF)
Monterey Regional Airport

Year	Enplanements	Monterey County Population	TPF
2013	200,651	421,494	0.4760
CONSTANT SHARE OF 2013 TPF (AAGR = 0.73%)			
2018	206,726	434,255	0.4760
2023	213,305	448,076	0.4760
2033	231,989	487,323	0.4760
INCREASING SHARE OF TPF (AAGR = 1.73%)			
2018	212,785	434,255	0.4900
2023	233,000	448,076	0.5200
2033	282,647	487,323	0.5800

AAGR: Average Annual Growth Rate
Source: 2013 enplanements from airport records. Population from California Department of Finance

The second projection considers a growing TPF to 0.5800 by 2033, which results in a 2033 enplanement forecast of 282,647. This long term TPF (0.5800) is below the level the Airport has achieved in the past (0.5860 in 2000) and may, therefore, still be somewhat conservative. One significant factor limiting consideration of a more aggressive TPF is the fact that airlines have been consolidating capacity with fewer flights and larger aircraft serving airports such as Monterey Regional Airport.

Market Share of U.S. Domestic Enplanements

The next forecasting method employed considers the Airport's market share of U.S. domestic enplanements. National forecasts of U.S. domestic enplanements are compiled each year by the FAA and take into account the state of the economy, fuel prices, and prior year developments. The most recent publication is FAA *Aerospace Forecasts – Fiscal Years 2014-2034*. Included are forecasts of both total domestic passenger enplanements as well as forecasts of regional carrier passenger enplanements. Enplanement forecasts based on Monterey Regional Airport's historic market share of total and regional carrier enplanements have been developed as follows.

U.S Air Carrier Enplanement Market Share

Two enplanement forecasts have been developed as a market share of total U.S. domestic airline enplanements, as shown in **Table 2J**. The FAA forecasts a 1.9 percent annual increase in U.S. commercial air carrier enplanements from 2013-2034. The first projection considers the Airport maintaining a constant market share of 0.03067 percent. This projection yields 290,565 enplanements by the end of the planning period. A second forecast projects Monterey Regional Airport gaining market share through the planning period as the Airport captures a higher percentage of the flying public in the region. This projection yields 336,363 enplanements by 2033.

U.S. Regional Carrier Enplanement Market Share

Two enplanement forecasts have been developed as a market share of U.S. domestic regional airline enplanement forecasts, as shown in **Table 2K**. The FAA forecasts enplanements by regional carriers grow at 1.9 percent annually from 2014-2034. The FAA's regional carrier forecast is a subset of total air carrier enplanements. The first projection considers the Airport maintaining a constant market share of 0.12904 percent. This projection yields 291,492 enplanements by the end of the planning period. A second forecast projects Monterey Regional Airport gaining market share through the planning period as the Airport captures a higher percentage of the flying public in the region. This projection yields 329,136 enplanements by 2033.

TABLE 2J
Market Share Projections of U.S. Commercial Enplanements

Enplanement Forecast Summary

Several projections of future enplanement levels have been presented. The first methodologies analyzed were various time-series and regression analyses. These included consideration of historical enplanements as the dependent variable and population, employment, income, and FAA forecasts of national enplanements as the independent variable(s). None of these analyses resulted in a reliable correlation coefficient (Pearson's "r"). To be considered reliable, the correlation coefficient should be above 0.9; however, all were below 0.62. As a result, neither the time-series nor the regression methods were considered statistically reliable.

The next forecast method employed considered the Travel Propensity Factor (TPF), which is the ratio of enplanements to total area population. Two forecasts were developed utilizing this method. The first considered maintaining the 2013 TPF (0.4760) through the 20-year planning horizon. The second considered a moderately increasing TPF with the Airport ultimately approaching the TPF experienced in 2000 (0.5860).

Four additional market share forecasts were developed which consider the FAA forecast of both total U.S. domestic enplanements and U.S. regional carrier enplanements, a subset of total enplanements. These forecasts consider both a constant market share of the Airport's 2013 percent as well as an increasing market share. Both of the increasing market share projections are moderate in nature as neither result in reaching enplanement levels achieved in the recent history of the Airport. For example, in 2004, the Airport captured 0.14978 percent of U.S. regional carrier enplanements, but the increasing scenario considers a 2033 market share of 0.14570 percent.

Table 2L presents a summary of the enplanement forecasts considered for the Airport. These forecasts are also shown graphically on **Exhibit 2J**. For comparative purposes, the FAA *Terminal Area Forecast* is also shown.

TABLE 2L
Enplanement Projection Summary
Monterey Regional Airport

2013 Enplanements - 200,651	2018	2023	2033	AAGR 2013-2033
Travel Propensity Factor (TPF) Projections				
Constant TPF Share	206,726	213,305	231,989	0.73%
Increasing TPF Share	212,785	233,000	282,647	1.73%
Market Share of U.S. Air Carrier Enplanements				
Constant	226,380	246,559	290,565	1.87%
Increasing	228,104	258,888	336,363	2.62%
Market Share of U.S. Regional Carrier Enplanements				
Constant	227,749	247,749	291,492	1.88%
Increasing	232,804	262,080	329,136	2.51%
Comparable Projections				
FAA TAF - 2014	219,220	234,692	269,322	1.38%
Selected Forecast	**223,000**	**245,000**	**275,000**	**1.59%**

AAGR: Average Annual Growth Rate

The six new forecasts developed create a reasonable planning envelope. The selected forecast considers higher than average growth in the short and intermediate terms as the economy returns to more normal growth patterns. Enplanement levels at the Airport over the last three years (2011-3013) have already begun showing signs of recovery with an annual growth rate in enplanements of nearly 3.4 percent. While it is not reasonable to assume this growth rate for the extended future, strong growth in enplanements in the short and intermediate term is reasonable. By the long term planning period, enplanement growth is forecast to level out somewhat. The selected enplanement forecast for the Monterey Regional Airport is for 223,000 by end of the short term planning period, 245,000 by the intermediate term, and 275,000 by the long term.

AIRLINE OPERATIONS AND FLEET MIX

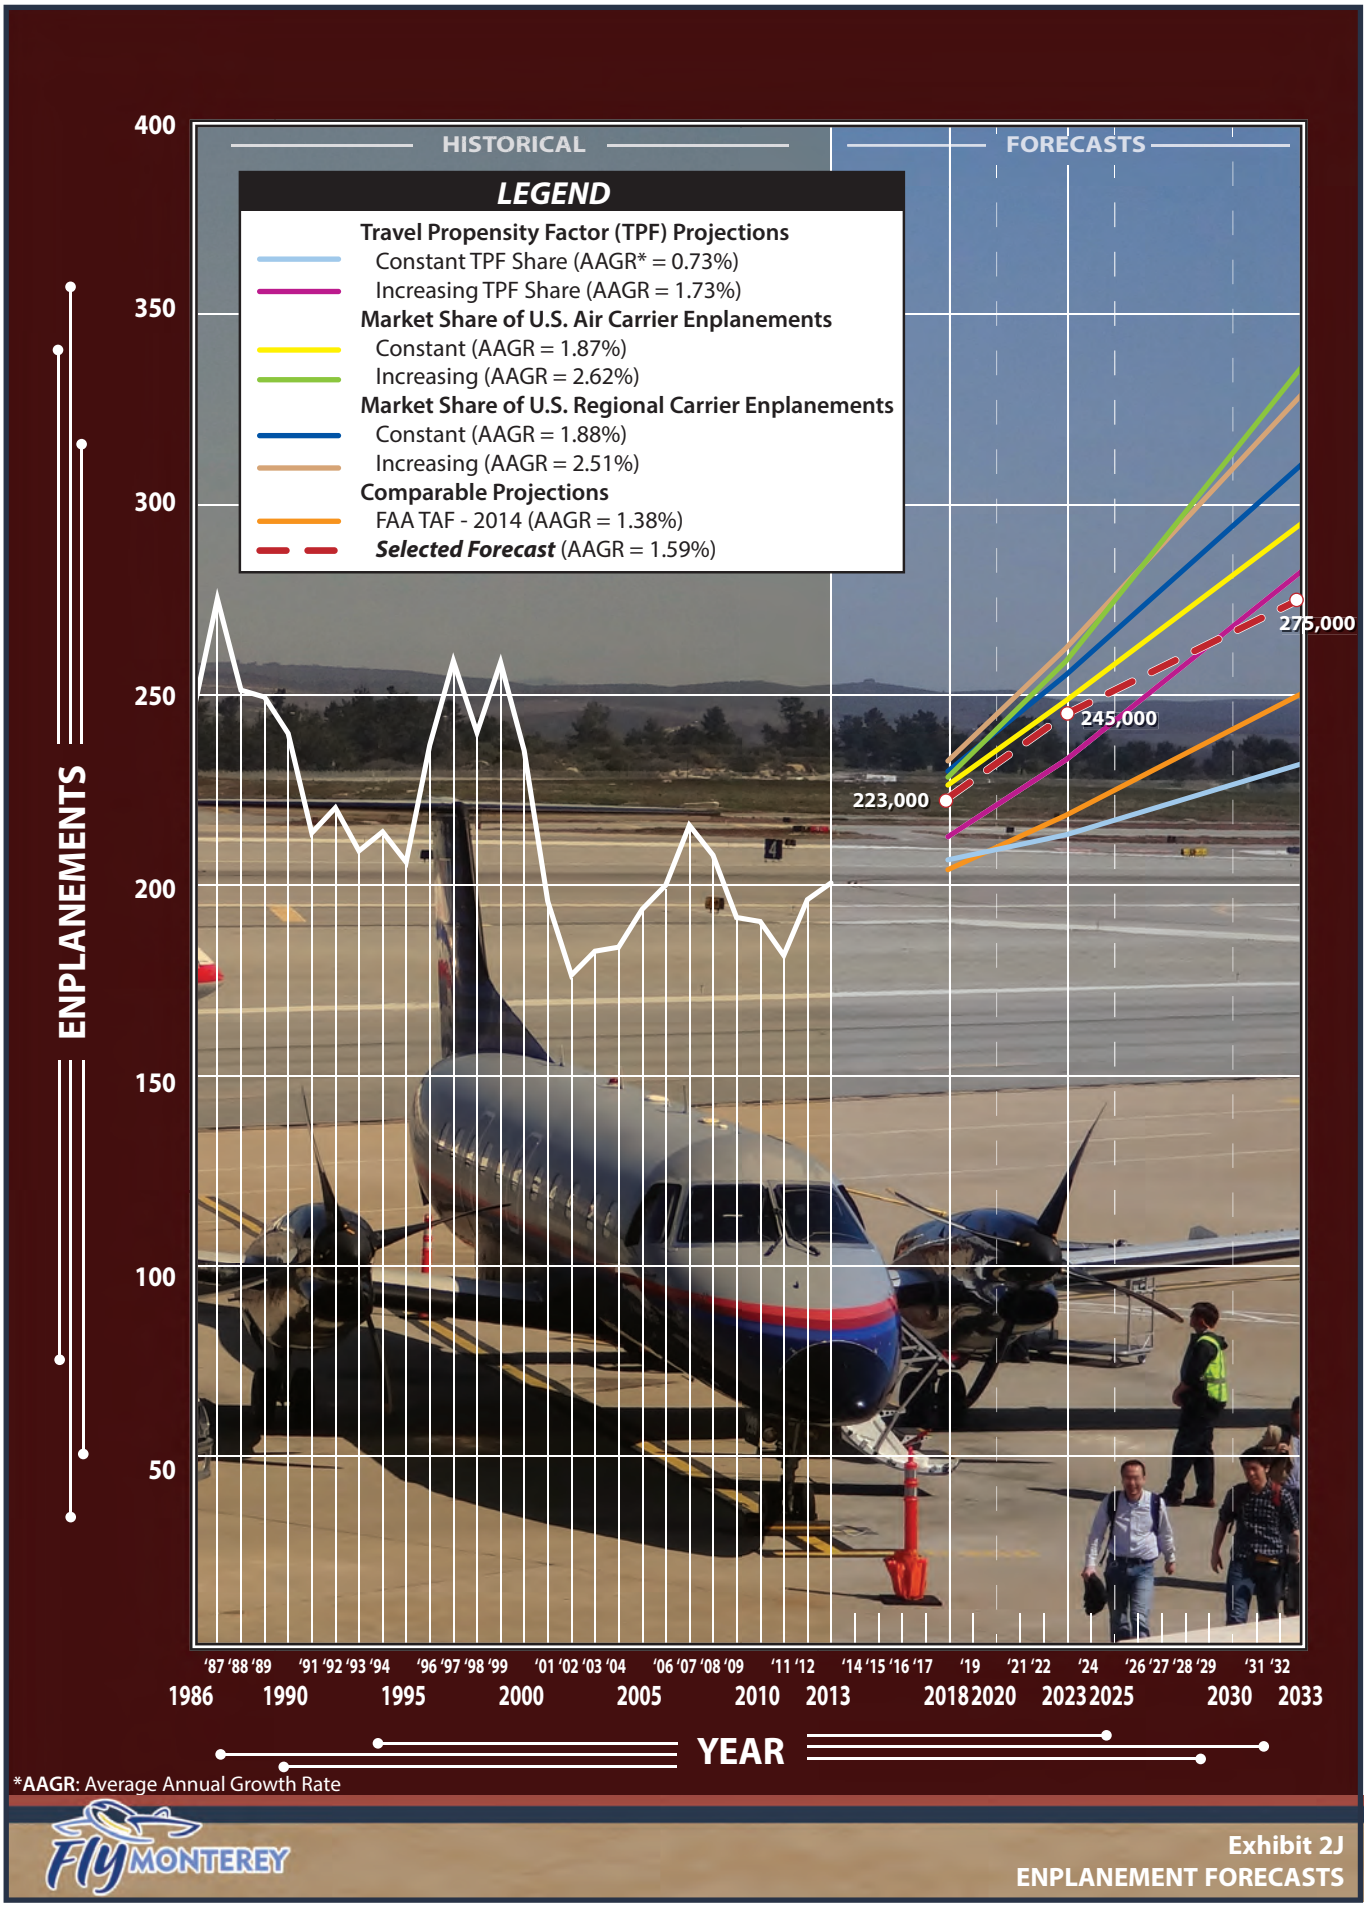
The type of aircraft in the commercial airline fleet serving the airport is an important component of airport planning. Not only is the commercial airline fleet mix serving an airport helpful in determining the number of commercial airline operations at an airport, but it is also helpful in defining many of the key parameters used in airport planning; namely, the critical aircraft serving the airport (used for pavement design, ramp apron geometry, and terminal complex layout), and the maximum stage length capabilities (which affects runway length evaluations).

Exhibit 2K presents the monthly moving totals for both airline landings and available seats since 2007 at the Airport. This graphic can be useful in identifying trends at the Airport. One noticeable trend has been the steady decline in the number of landings by United Express, yet at the same time, the number of available seats has remained fairly steady. This is an indication of the national trend toward consolidating flights using larger aircraft. United Express has done just this, moving from the smaller turboprop aircraft to regional jets over the years.

Table 2M presents an annual percentage breakdown of the airline fleet mix by seating capacity for the Airport since 2008. In 2013, approximately 61 percent of the commercial airline flights at the Airport were conducted by aircraft with between 50 and 59 passenger seats. This category includes the 50-seat CRJ-200 which is operated by US Airways, American Eagle, and United Express. The next highest category at approximately 30 percent is those aircraft with between 19 and 39 seats, which is exclusively the result of United Express's use of the Embraer 120 twin turboprop for flights to San Francisco.

By comparison, in 2008 these utilization rates were nearly reversed. The period in the mid-2000s saw many carriers transition from smaller turboprop aircraft, such as the Saab-340 and the DASH-8/200, to regional jets.

The 40-49 seat aircraft category accounted for up to 22 percent of activity at the Airport as recently as 2010. American Eagle utilized the 44-seat Embraer 140 until 2012 when they transitioned to the 50-seat CRJ-200. Today, there are no commercial flights utilizing an aircraft in this category and American Eagle is set to retire its entire fleet of Embraer 140 aircraft by 2017.



*AAGR: Average Annual Growth Rate

FLY MONTEREY

Exhibit 2J
ENPLANEMENT FORECASTS

With the introduction of service by Alaska Airlines utilizing the 76-seat Q-400 turboprop, activity by aircraft in the 60-79 seat category has begun to rise, accounting for slightly over six percent of activity in 2013. This is a growth category for air carriers as they look to consolidate flights onto larger aircraft. There are several other aircraft that fall in this category which may soon operate at the Airport. These include the 70-seat Embraer 170 and 78-seat 175 models.

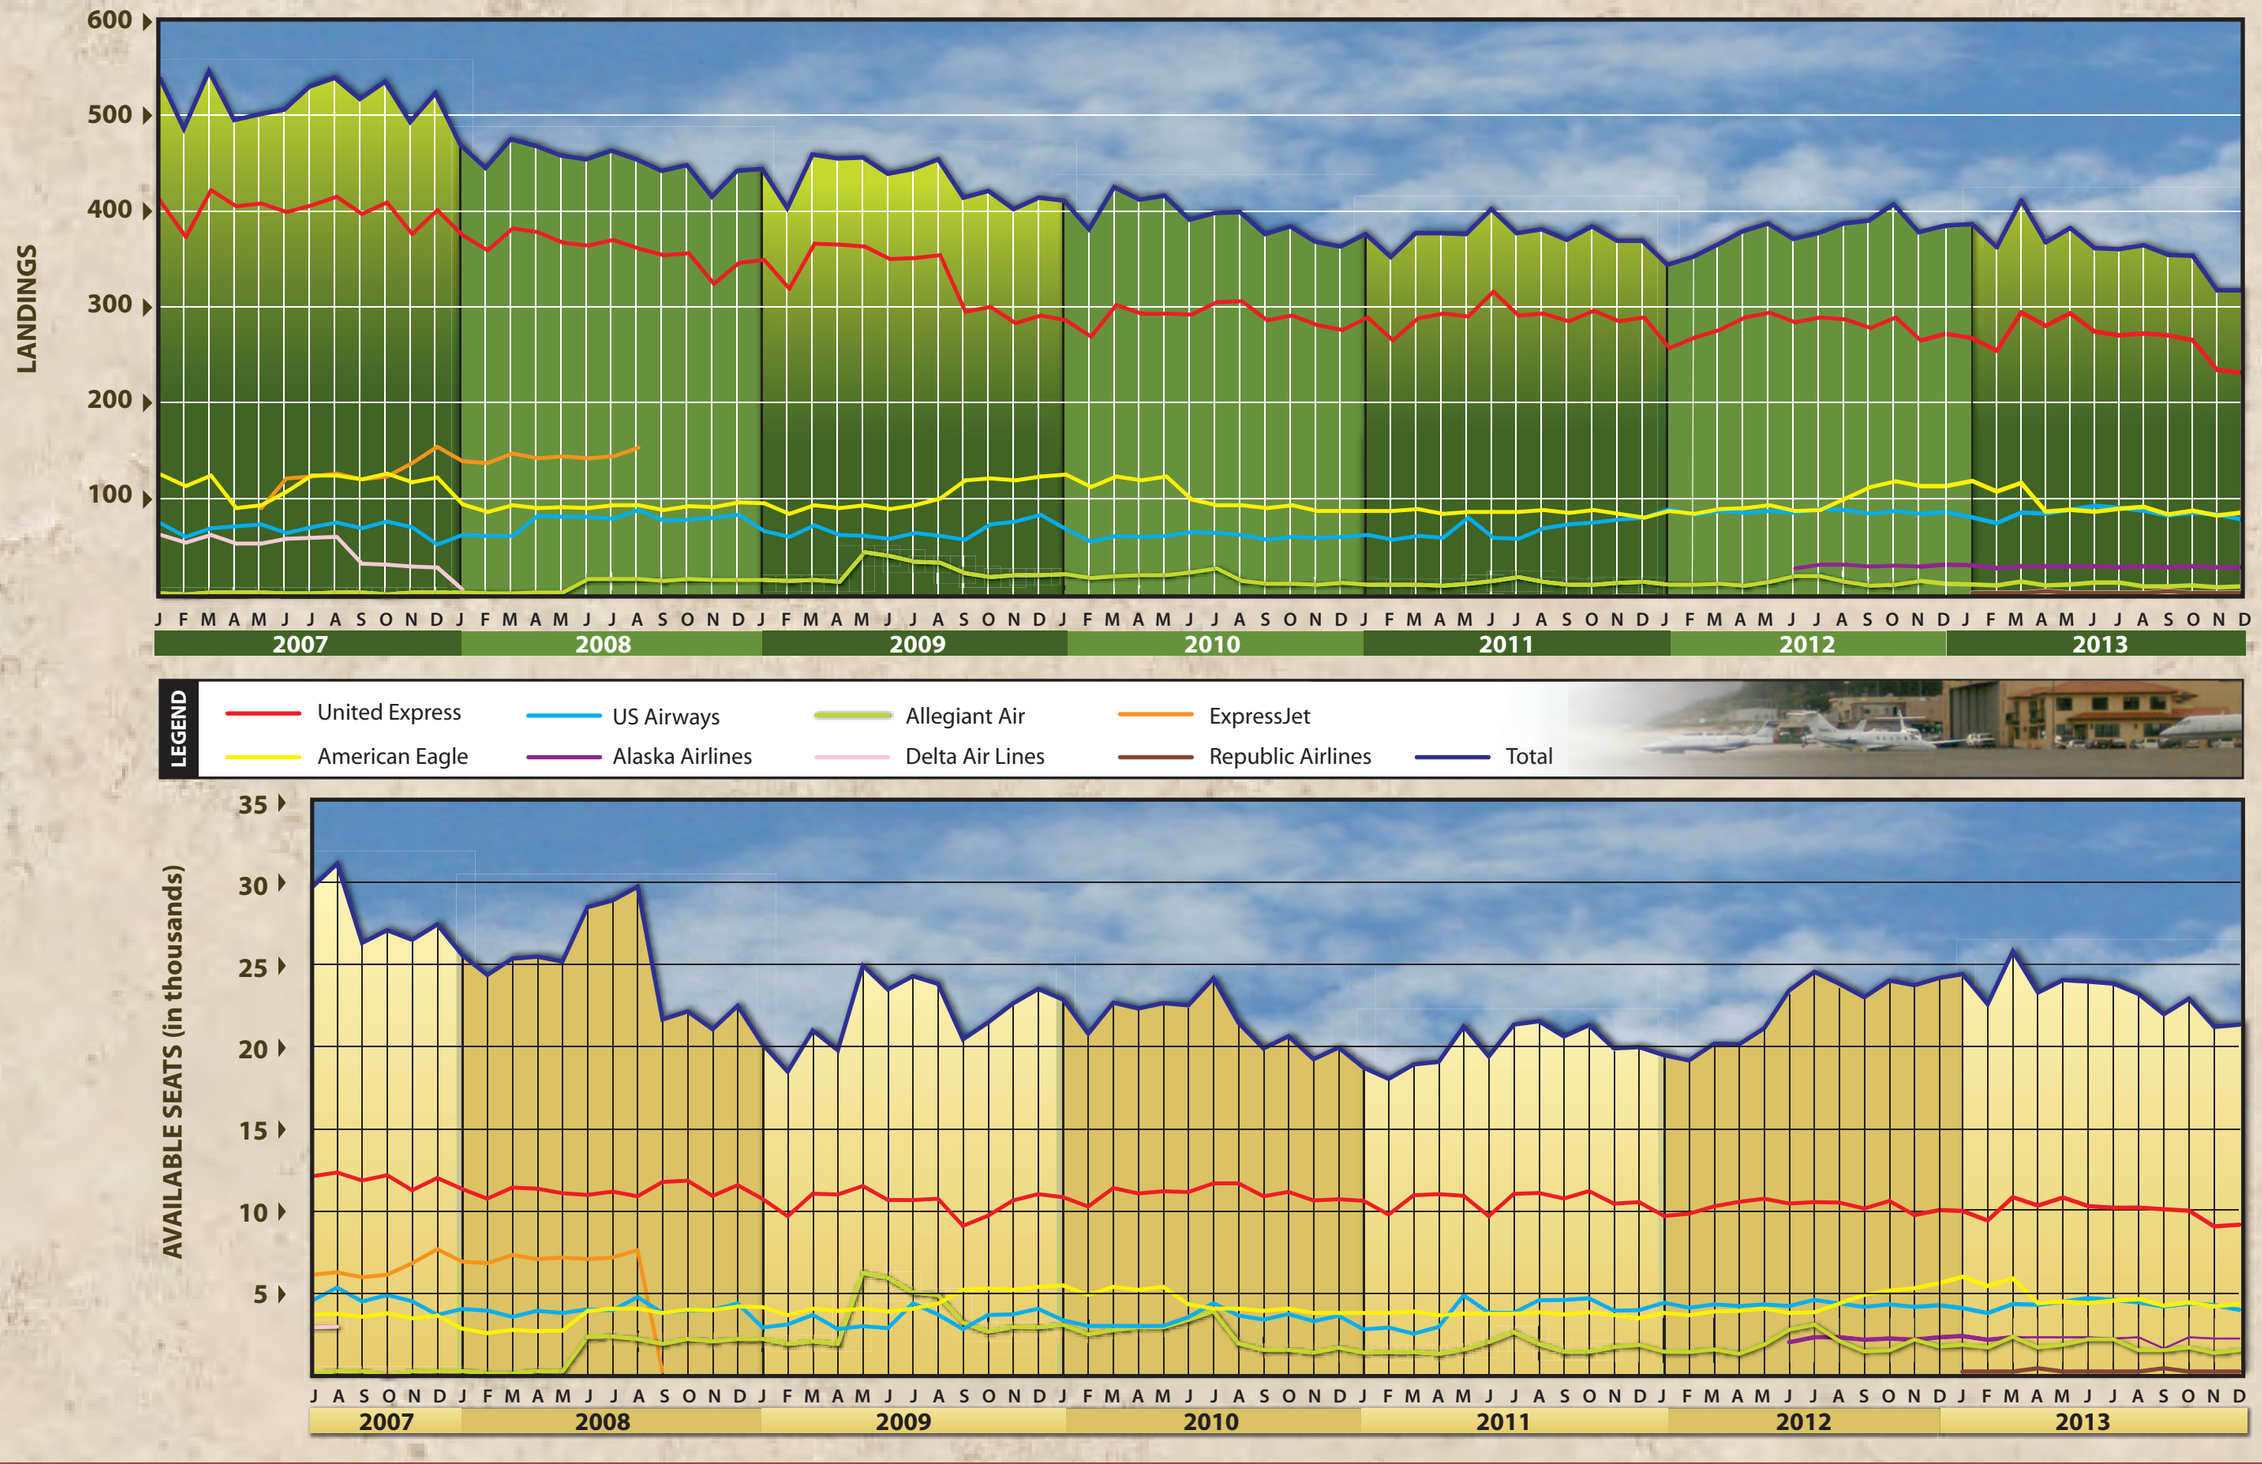
Commuter Ops (<60 seats)	14,040	11,118	9,922	9,824	11,100	10,724

Source: Airport records of enplanements, landings, and equipment.

The Airport is also beginning to realize activity with larger regional jets. Republic Airlines began regular charter service to Reno and Laughlin, catering to vacationers who gamble. Republic Airlines utilizes the 99-seat Embraer 190 aircraft.

Allegiant Airlines operates the largest category of aircraft at the Airport. Currently, they utilize the 150/166 seat MD-83/88 aircraft for twice weekly trips to Las Vegas. These larger aircraft accounted for 2.2 percent of the fleet mix in 2013.

The average seats per departure have risen steadily from 35 in 2008 to 47 in 2013, reflecting the airline's shift away from the 50-seat regional jets. Over the short and intermediate term, the 50-seat regional jets will be gradually phased out entirely. It is expected that the Airport will continue to realize activity by aircraft with even greater seating capacity, such as the Q-400 turboprop, CRJ-700 and 900, and the ERJ-170 and 190 models. As passenger enplanements grow at the Airport, airlines could eventually introduce aircraft in the 115-124 seat range, such as the Boeing 737-700 or the Airbus A319. Allegiant is currently ordering the 156-seat A-319 aircraft for use on the west coast to replace the aging MD-80 series aircraft.



FLY MONTEREY

Exhibit 2K
12-MONTH MOVING TOTALS LANDINGS AND AVAILABLE SEATS

This page intentionally left blank

The boarding load factor (BLF) is defined as the ratio of passengers boarding an aircraft compared to the seating capacity of the aircraft. The BLF percentage at the Airport has been in the low to mid-70 percent since 2009. The BLF experienced by the airlines can be expected to continue to grow modestly in the future as the airlines continue to seek profitability.

The airline industry has been undergoing a dramatic adjustment in its fleet mix composition. Higher fuel prices led to a reduction in domestic capacity as airlines attempted to generate a profit. A slowing U.S. economy also impacted their ability to quickly return to profitable operations. With rising fuel costs, the original 50-seat regional jets have been found to be less cost-effective than the newer stretched versions of 66 seats and up.

The long term outlook for the airline fleet mix at the Airport is dependent on traffic growth and additional technological advancements. Current trends and fleet orders have provided input into the projection of annual departures and operations by the scheduled carriers. **Table 2N** depicts the aircraft fleet mix and seating capacities and the number of operations by each aircraft in 2013.

TABLE 2N
2013 Aircraft Seating and Operations
Monterey Regional Airport

Source: Airport records

Currently, US Airways relies heavily on the CRJ-200, but has begun to introduce the CRJ-900. American Eagle relies exclusively on the CRJ-200. United Express also heavily utilizes the CRJ-200 but has, at times, utilized the CRJ-700 and -900 at the Airport. In addition, United Express utilizes the 27-seat Embraer 120 turboprop for four daily departures to San Francisco. Alaska Airlines is utilizing the Q-400 for their once-a-day service to and from San Diego. Allegiant utilizes the MD-80 series aircraft for their twice weekly (on average) flights to and from Las Vegas. Finally, 2013 saw a new offering at the Airport. Republic Airlines is providing charter service to Reno and Laughlin utilizing the 99-seat ERJ-190 aircraft.

Table 2P presents the resulting fleet mix and operations forecast for the Airport. The table also serves as a summary of both forecast airline enplanements and operations at the Airport.

Source: Airport records of enplanements, landings, and equipment. Forecast: Coffman Associates.

Generally, the Airport can expect to see a transition to slightly larger aircraft over the forecast period. Aircraft with more than 60 seats are forecast to increase from 8.8 percent of the fleet activity to 34 percent by 2033. The 50-59 seat category is projected to decline by approximately 10 percent by 2033. The small commuter aircraft category with fewer than 39 seats is also expected to decline. Monterey Regional Airport will likely always have at least one smaller turboprop commuter airline providing service to the Bay area. Likewise, the 50-seat CRJs are almost ideally suited for intrastate flights.

AIR CARGO FORECASTS

Air freight includes the combined activities of the scheduled passenger airlines carrying freight on scheduled flights and the dedicated all-cargo carriers. Air mail may also be carried by both the scheduled passenger airlines and all-cargo carriers. Freight and mail together make up air cargo activity at an airport. This section describes the national aviation trends in the air cargo airline industry, historical activity at Monterey Regional Airport, and future projections of air cargo activity.

NATIONAL AIR CARGO TRENDS

Air cargo activity has historically had a high correlation to gross domestic product (GDP). Other factors that affect air cargo growth are real yields, improved productivity, and globalization. Ongoing trends that are and will continue to improve the air cargo market include the opportunities from open skies agreements, decreasing costs from global airline allianc-

es, and increasing business volumes from e-commerce. At the same time, trends that could limit air cargo growth include increased use of mail substitutes (e-mail) and increased airline costs due to environmental and security restrictions.

Before 2001, air cargo was the fastest growing sector of the aviation industry. From 1994 through 2000, total tons and revenue ton-miles (RTMs) grew at annual average rates of 8.0 and 8.6 percent, respectively. An economic slowdown in the U.S., combined with the collapse in the high-tech industry and a slowing of imports, resulted in declines of 5.0 percent in tons and 3.9 percent in RTMs in 2002. Domestic RTMs grew modestly through 2007 and then realized a steep decline that coincided with the 2008-2009 national recession. In 2006, RTMs had reached 15.4 billion tons; by 2009, 11.9 billion RTMs were realized. Domestic RTMs have been growing since 2011 and are forecast to grow 1.4 percent annually through the forecast period. By 2034, RTMs are forecast to reach 16.4 billion.

The FAA notes there are several structural changes that are occurring within the air cargo industry. Among them are the following:

- **Security regulations** – On August 3, 2007, *Recommendations of the 9/11 Commission Act of 2007* was signed into law. Section 1602 of this Act states that air cargo placed on passenger aircraft will receive the same level of screening as passenger-checked baggage. Legislation called for the establishment of a system by 2010 that required 100 percent inspection of cargo transported by passenger aircraft.

- **Market maturation** – The express market in the United States has matured after dramatic growth over the last two decades. This represents the majority of domestic air cargo activity.

- **Modal shift** – Improved service and economics from the use of alternative modes of cargo transported by the integrated cargo carriers (e.g., FedEx and UPS) has matured.

- **Increases in air fuel surcharges** – Fuel costs are a significant factor for all aviation.

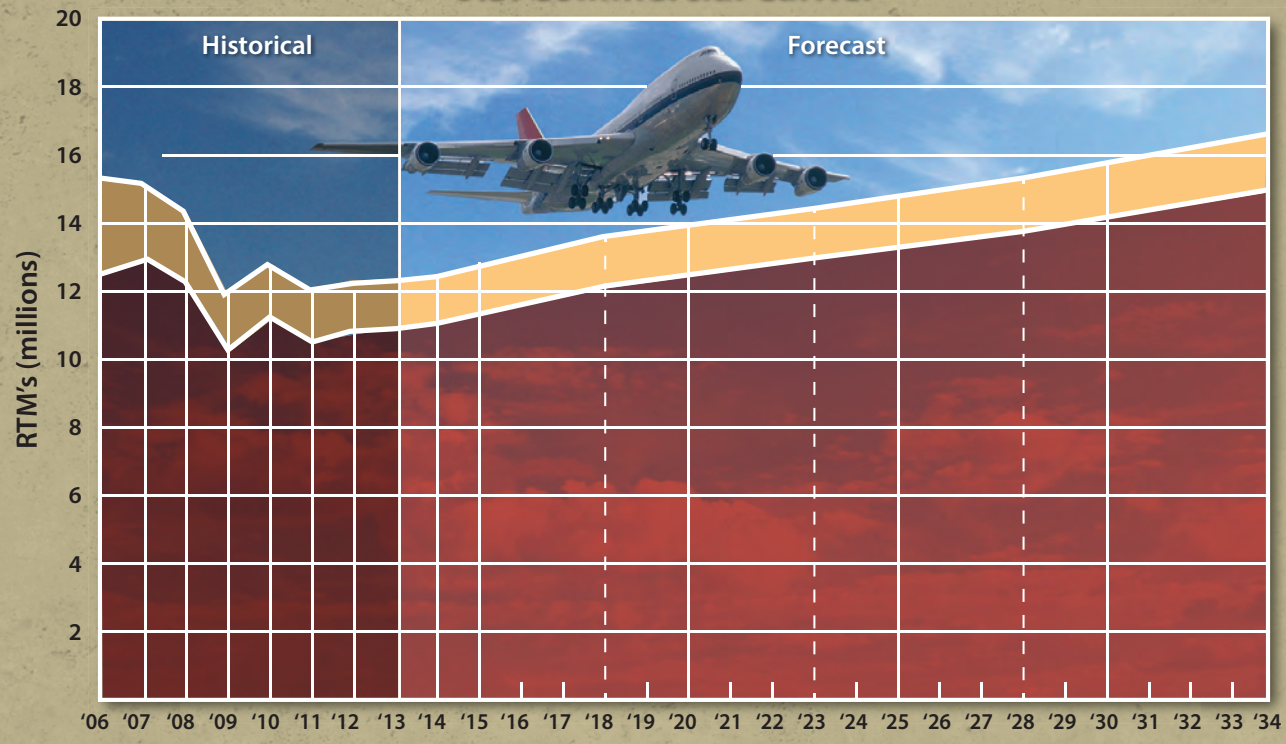
- **Increased USPS use of all-cargo carriers** – This initially resulted from the U.S. Postal Service's (USPS) need to improve control over delivery. The trend has continued due to security regulations.

- **Increased use of mail substitutes** – Substitutes such as e-mail affect mail volume. The residual fear of mail because of terrorism has also been a factor.

The FAA forecast for RTMs was based on several specific assumptions exclusive to the air cargo industry. First, security restrictions will remain in place. Second, most of the shift from air to ground transportation has occurred. Finally, long-term cargo activity is tied to economic growth.

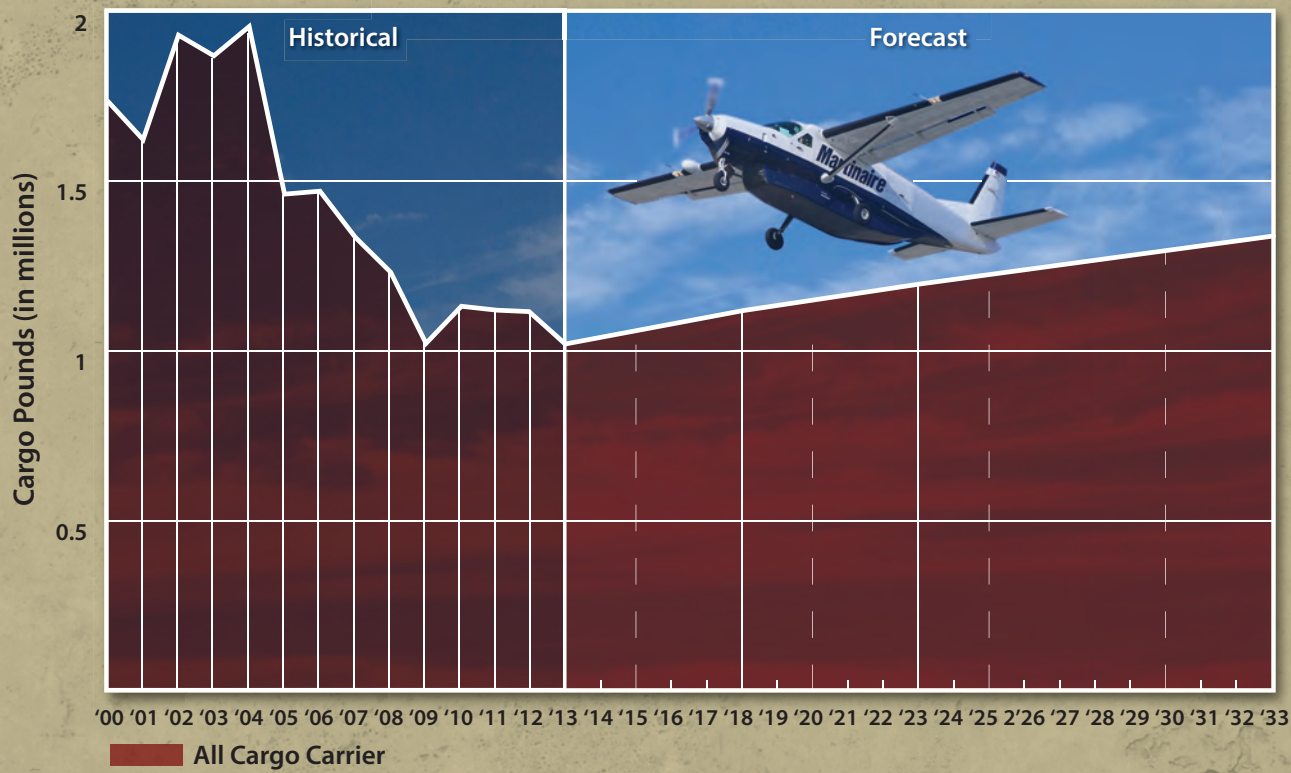
The largest growth will continue to be in international cargo, which is projected to grow at an annual average rate of 5.2 percent from 2013 through 2034. Domestic cargo is forecast to grow at an annual rate of 1.4 percent over the same period. **Exhibit 2L** depicts the FAA forecasts for air cargo and the forecast for cargo activity at Monterey Regional Airport.

Domestic Air Cargo Revenue Ton Miles (RTM's)
U.S. Commercial Carrier



Source: FAA Aerospace Forecasts 2014-2034

Monterey Air Cargo Total Pounds



FLY MONTEREY

Exhibit 2L
AIR CARGO FORECAST

Air cargo RTMs flown by all-cargo carriers comprised 79.7 percent of total RTMs in 2013, with passenger carriers flying the remainder. Total RTMs flown by the all-cargo carriers decreased 5.0 percent in 2013 from 29.2 billion to 27.7 billion. Total RTM flown by passenger carriers were 7.1 billion in 2013, 3.8 percent lower than in 2012. Both trends are forecast to reverse rather quickly with all-cargo RTMs increasing 4.3 percent annually through 2034, and passenger carrier RTM increasing 3.3 percent annually through the same period.

The number of large cargo jet aircraft declined by 98 aircraft in 2013, primarily due to the retirements of 727-200s and 747-200s by Federal Express, Evergreen, and Southern Air. For the remainder of the forecast period, cargo large jet aircraft at U.S. carriers are forecast to grow at an average annual rate of 2.4 percent to 1,182 aircraft in 2034. The narrow-body, cargo jet fleet is projected to increase by five aircraft per year over the forecast period as older 757's and 737's are converted to cargo service. The wide-body, cargo jet fleet is projected to increase by 16 aircraft yearly.

AIR CARGO FORECAST

Air cargo at Monterey Regional Airport is handled by primary carriers West Air/FedEx and Martin Aire/UPS. Both West Air and Martin Aire utilize the Cessna Caravan single engine turboprop aircraft. Both operate daily to Oakland International Airport. The Caravan has a maximum payload capacity of 3,665 pounds.

Table 2Q depicts air cargo activity at the Airport since 2000. The Airport has shown a steady decline in air cargo tons. The recessions of 2001 and 2008-2009 are clearly reflected by decreases in air cargo activity. The table provides a constant share projection of national domestic RTMs as the forecast for the Airport. Projected air cargo at the Airport is not expected to reach levels that will produce major air cargo fleet mix changes. The existing fleet of turboprops will be capable of accommodating the projected air cargo growth through 2033.

TABLE 2Q

Source: [1]Airport records; [2]FAA Aerospace Forecasts Fiscal Years 2014-2034.

GENERAL AVIATION FORECASTS

General aviation encompasses all portions of civil aviation except commercial service and military operations. To determine the types and sizes of facilities that should be planned to accommodate general aviation activity at Monterey Regional Airport, certain elements of this activity must be forecast. These indicators of general aviation demand include based aircraft, aircraft fleet mix, and annual operations.

FAA GENERAL AVIATION FORECASTS

The FAA forecasts the fleet and hours flown for single-engine piston aircraft, multi-engine piston aircraft, turboprops, business jets, piston and turbine helicopters, light sport, experimental, and others (gliders and balloons). The FAA forecasts "active aircraft," not total aircraft. An active aircraft is one that is flown at least one hour during the year. **Exhibit 2M** presents the historical and forecast U.S. active general aviation aircraft.

After growing rapidly for most of the past decade, the demand for business jet aircraft has slowed over the past few years as the industry has been hard hit by the economic recession. Nonetheless, the FAA forecast calls for robust growth in the long-term, driven by higher corporate profits and the growth of worldwide GDP. Additionally, continued concerns about safety, security, and flight delays keep business aviation attractive relative to commercial air travel. Overall, business aviation is projected to outpace personal/recreational use.

The active general aviation fleet is projected to increase at an average annual rate of 0.5 percent through 2034, growing from a 2013 estimate of 202,865 to 225,700 in 2034.

The turbine fleet, including helicopters, is forecast to grow annually at 2.6 percent, growing from 29,110 in 2013 to 49,565 in 2034. The fixed wing jet aircraft portion is forecast to grow 3.0 percent annually from a 2013 estimate of 11,890 to 14,370 in 2034. Turbine helicopter portion is forecast to grow 3.0 percent annually reaching 13,145 by 2034.

Piston-powered aircraft, including helicopters, are projected to decrease from the 2013 total of 141,325 to 131,615 through 2034, with declines in both single and multi-engine fixed wing aircraft but growth in piston helicopters. Over the forecast period, piston-powered fixed-wing aircraft are projected to decrease by an average annual rate of 0.4 percent. Although piston helicopters are forecast to increase by 1 percent a year, they are a relatively small portion of this segment of general aviation aircraft and, therefore, have little effect on the overall trend. Single-engine fixed-wing piston aircraft, which are much more numerous, are projected to decline at an annual rate of 0.4 percent, while multi-engine fixed wing piston aircraft are projected to decline by 0.5 percent a year.

The FAA began tracking the light sport aircraft segment of the general aviation fleet in 2005. At the end of 2013, a total of 2,110 of these aircraft were estimated. By 2034, a total

of 4,880 light sport aircraft are forecast to be in the fleet for an annual growth rate of 4.1 percent.

BASED AIRCRAFT FORECAST

The number of based aircraft is the most basic indicator of general aviation demand. By first developing a forecast of based aircraft for Monterey Regional Airport, other general aviation activities and demand can be projected. The process of developing forecasts of based aircraft begins with an analysis of aircraft ownership in the primary general aviation service area through a review of historical aircraft registrations.

Area Aircraft Ownership (Registered Aircraft)

Analysis presented earlier indicates that Monterey County is the primary service area for general aviation demand. Aircraft ownership trends for the primary service area typically dictate the based aircraft trends for an airport. As such, an analysis of Monterey County aircraft registrations was made.

Table 2R presents the history of registered aircraft in Monterey County from 1993 through 2013. These figures are derived from the FAA aircraft registration database that categorized registered aircraft by county based on the zip code of the registered aircraft. Although this information generally provides a correlation to based aircraft, it is not uncommon for some aircraft to be registered in the county, but based at an airport outside the county or vice versa.

TABLE 2R
Monterey County Registered Aircraft

Year	SEP	MEP	TP	J	H	O	Total
1993	388	53	11	19	30	7	508

Source: FAA Aircraft Registration Database

In 2013, there were 402 aircraft registered in the county. This represented the lowest level since 1993. The highest number of registered aircraft was 534 in 2001. Over the previous 20 years, the county has averaged 503 registered aircraft. Now that the actual number of registered aircraft has been identified, several projections of future registered aircraft are considered for the 20-year planning horizon.

Registered aircraft projections are presented in **Table 2S** and are graphically depicted on **Exhibit 2N**. These projections evaluate the potential growth of aircraft demand (registered aircraft) in Monterey County over the next 20 years.

TABLE 2S
Registered Aircraft Projections
Monterey County

Year	County Registrations[1]	U.S. Active Aircraft[2]	Market Share	County Population[3]	Aircraft Per 1,000 Residents

Exhibit 2N
REGISTERED AIRCRAFT FORECAST

Source: Registered Aircraft History - FAA Aircraft Registration database

Since 2009, the number of registered aircraft in Monterey County has declined annually. In 2013, there were 402 registered aircraft compared to 536 in 2008. As a result, various regression and time-series analyses did not result in a reliable forecast. Therefore, several market share forecasts have been developed.

The first two projections consider the county's market share of total active general aviation aircraft in the U.S. fleet as identified in the FAA's annual forecasts. The first projection considers the county maintaining its 2013 percent (0.1982%) as a constant into the forecast years. This results in a long term projection of 443 registered aircraft and an annual growth rate of 0.48 percent. The second projection applies the 10-year average market share of registered aircraft as a ratio to the U.S. active aircraft fleet. This results in a constant market share of 0.2249 percent and an annual growth rate of 1.12 percent. By 2033, this projection results in 502 registered aircraft in the county.

The next two projections consider the ratio of forecast population for the county to registered aircraft. The first of these projections considers the Airport maintaining its 2013 ratio of 0.9527 aircraft per 1,000 people in the county. This results in a 2033 projection of 464 registered aircraft and an annual growth rate of 0.72 percent. The second projection considers the 10-year average (1.2020) of registered aircraft per 1,000 county residents.

The selected forecast of registered aircraft assumes that by 2033, the county can achieve an average of the four projections presented. By the long term, 515 registered aircraft are forecast. The 2018 and 2023 projections show progressive growth toward the long term projection.

The registered aircraft projection is one data point to be used in the development of a based aircraft forecast. The following section will present several potential based aircraft forecasts as well as the selected based aircraft master plan forecast.

Based Aircraft Forecasts

Determining the number of based aircraft at an airport can be a challenging task. Aircraft storage can be somewhat transient in nature, meaning aircraft owners can and do move their aircraft. Some aircraft owners may store their aircraft at an airport for only part of the year. For many years, the FAA did not require based aircraft records; therefore, historical records are often incomplete or non-existent. For this study, the Airport provided leasing information for those hangars that the Airport owns and obtained the number of aircraft housed in hangars owned by others. As of 2013, there were 152 aircraft based at Monterey Regional Airport.

The FAA TAF is an initial forecast source for based aircraft at the Airport. The 2014 TAF estimated that there were 138 based aircraft in 2013, which was forecast to grow to 171 by 2033 for an annual growth rate of 1.08 percent. **Table 2T** shows the FAA TAF history and forecasts of based aircraft. As can be seen, the 2014 TAF underestimates the number of based aircraft by 14 aircraft. Form 5010 is the FAA *Airport Master Record* for an airport and it presents a single year based aircraft figure. In 2013, Form 5010 for the Airport identified 136 based aircraft, which consisted of 112 single engine piston, 14 multi-engine pis-

ton, 7 jets, and 3 helicopters. Obviously, there is a range of based aircraft that have been reported for the Airport.

Form 5010 Airport Master Record			136			

TAF - Terminal Area Forecast

Several forecasts of based aircraft for the Airport have been developed. As with forecasts of registered aircraft, the goal is to develop a planning envelope of reasonable forecasts, then select a 20-year planning forecast for use in this study.

Table 2U considers several market share forecasts for based aircraft utilizing the forecast of registered aircraft in the county. In 2013, Monterey Regional Airport, with 152 based aircraft, accounted for 37.81 percent of the registered aircraft in the county. By maintaining this percent as a constant, a long term forecast of based aircraft emerges which results in 195 based aircraft by 2033. A second projection considers a modestly increasing market share of the county's registered aircraft. This forecast results in 216 based aircraft by 2033. A third projection shown utilizes the 2014 TAF projected annual growth rate of 1.08 percent as applied to the current based aircraft figure of 152. This results in a 2033 based aircraft estimate of 188. For comparative purposes, the 2014 TAF based aircraft projection is also presented.

TABLE 2U
Based Aircraft Forecast
Monterey Regional Airport

Year	Monterey County Registered Aircraft	Based Aircraft	Market Share
2013	402	152	37.81%
Constant Share Projection (AAGR 1.25%)			
2018	430	163	37.81%
2023	460	174	37.81%
2033	515	195	37.81%
Increasing Share Projection (AAGE 1.78%)			
2018	430	166	38.50%
2023	460	184	40.00%
2033	515	216	42.00%
2014 TAF Growth Rate With Current Baseline of 152 Based Aircraft (AAGR = 1.07%)			
2018	430	160	37.21%
2023	460	169	36.74%
2033	515	188	36.50%
FAA TAF 2014 (AAGR = 0.59%)			
2018	430	146	33.95%
2023	460	154	33.48%
2033	515	171	33.20%
Selected Planning Forecast (AAGR 1.38%)			
2018	430	160	37.21%
2023	460	175	38.04%
2033	515	200	38.83%

AAGR: Average Annual Growth Rate
Notes: 2013 based aircraft count from airport records.

The three new forecasts represent the reasonable planning envelope. The selected forecast is an approximate average of the projections. In the next five years, 160 based aircraft are projected. In 10 years, 175 are projected and by 2033, 200 based aircraft are projected. **Exhibit 2P** illustrates the based aircraft forecast.

BASED AIRCRAFT FLEET MIX

The fleet mix of based aircraft is oftentimes more important to airport planning and design than the total number of aircraft. For example, the presence of one or a few large business jets can impact design standards for the runway and taxiway system more than a large number of smaller single engine piston-powered aircraft.

The based aircraft fleet mix forecast for Monterey Regional Airport is presented in **Table 2V**. It has been developed based on local aircraft type usage and national trends as presented in FAA *Aerospace Forecasts - Fiscal Years 2014-2034*. The FAA expects business jets will continue to be the fastest growing general aviation aircraft type in the future. Monterey Regional Airport is well positioned to accommodate business jets in the future; nevertheless, smaller piston-powered aircraft will continue to dominate the based aircraft total at the Airport.

TABLE 2V
Based Aircraft Fleet Mix

GENERAL AVIATION OPERATIONS

General aviation (GA) operations are classified by the airport traffic control tower (ATCT) as either local or itinerant. A local operation is a take-off or landing performed by an aircraft that operates within sight of an airport, or which executes simulated approaches or touch-and-go operations at an airport. Itinerant operations are those performed by aircraft with a specific origin or destination away from an airport. Generally, local operations are characterized by training operations. Typically, itinerant operations increase with business and commercial use, since business aircraft are operated on a higher frequency.

While the Airport is open 24-hours a day, year round, the tower is open from 6:00am to 9:00pm daily. Therefore, it is likely that the tower does not count all activity at the airport. To be consistence with FAA, the general aviation operations forecast to follow consider

those operations that occur when the tower is open. Certain analysis to be conducted later in the Master Plan may incorporate an estimate of nighttime activity.

Itinerant Operations

Table 2W depicts general aviation itinerant operations at the Airport from 2000 through 2013. General aviation itinerant operations have experienced a declining trend since the most recent national recession in 2008. National general aviation itinerant operations have been declining since 2005, but have taken a steeper decline since the beginning of the recession and have yet to recover; however, the FAA forecasts a reversal by 2014. From 2012 through 2033, the FAA forecasts an annual growth rate of 0.4 percent for itinerant general aviation operations.

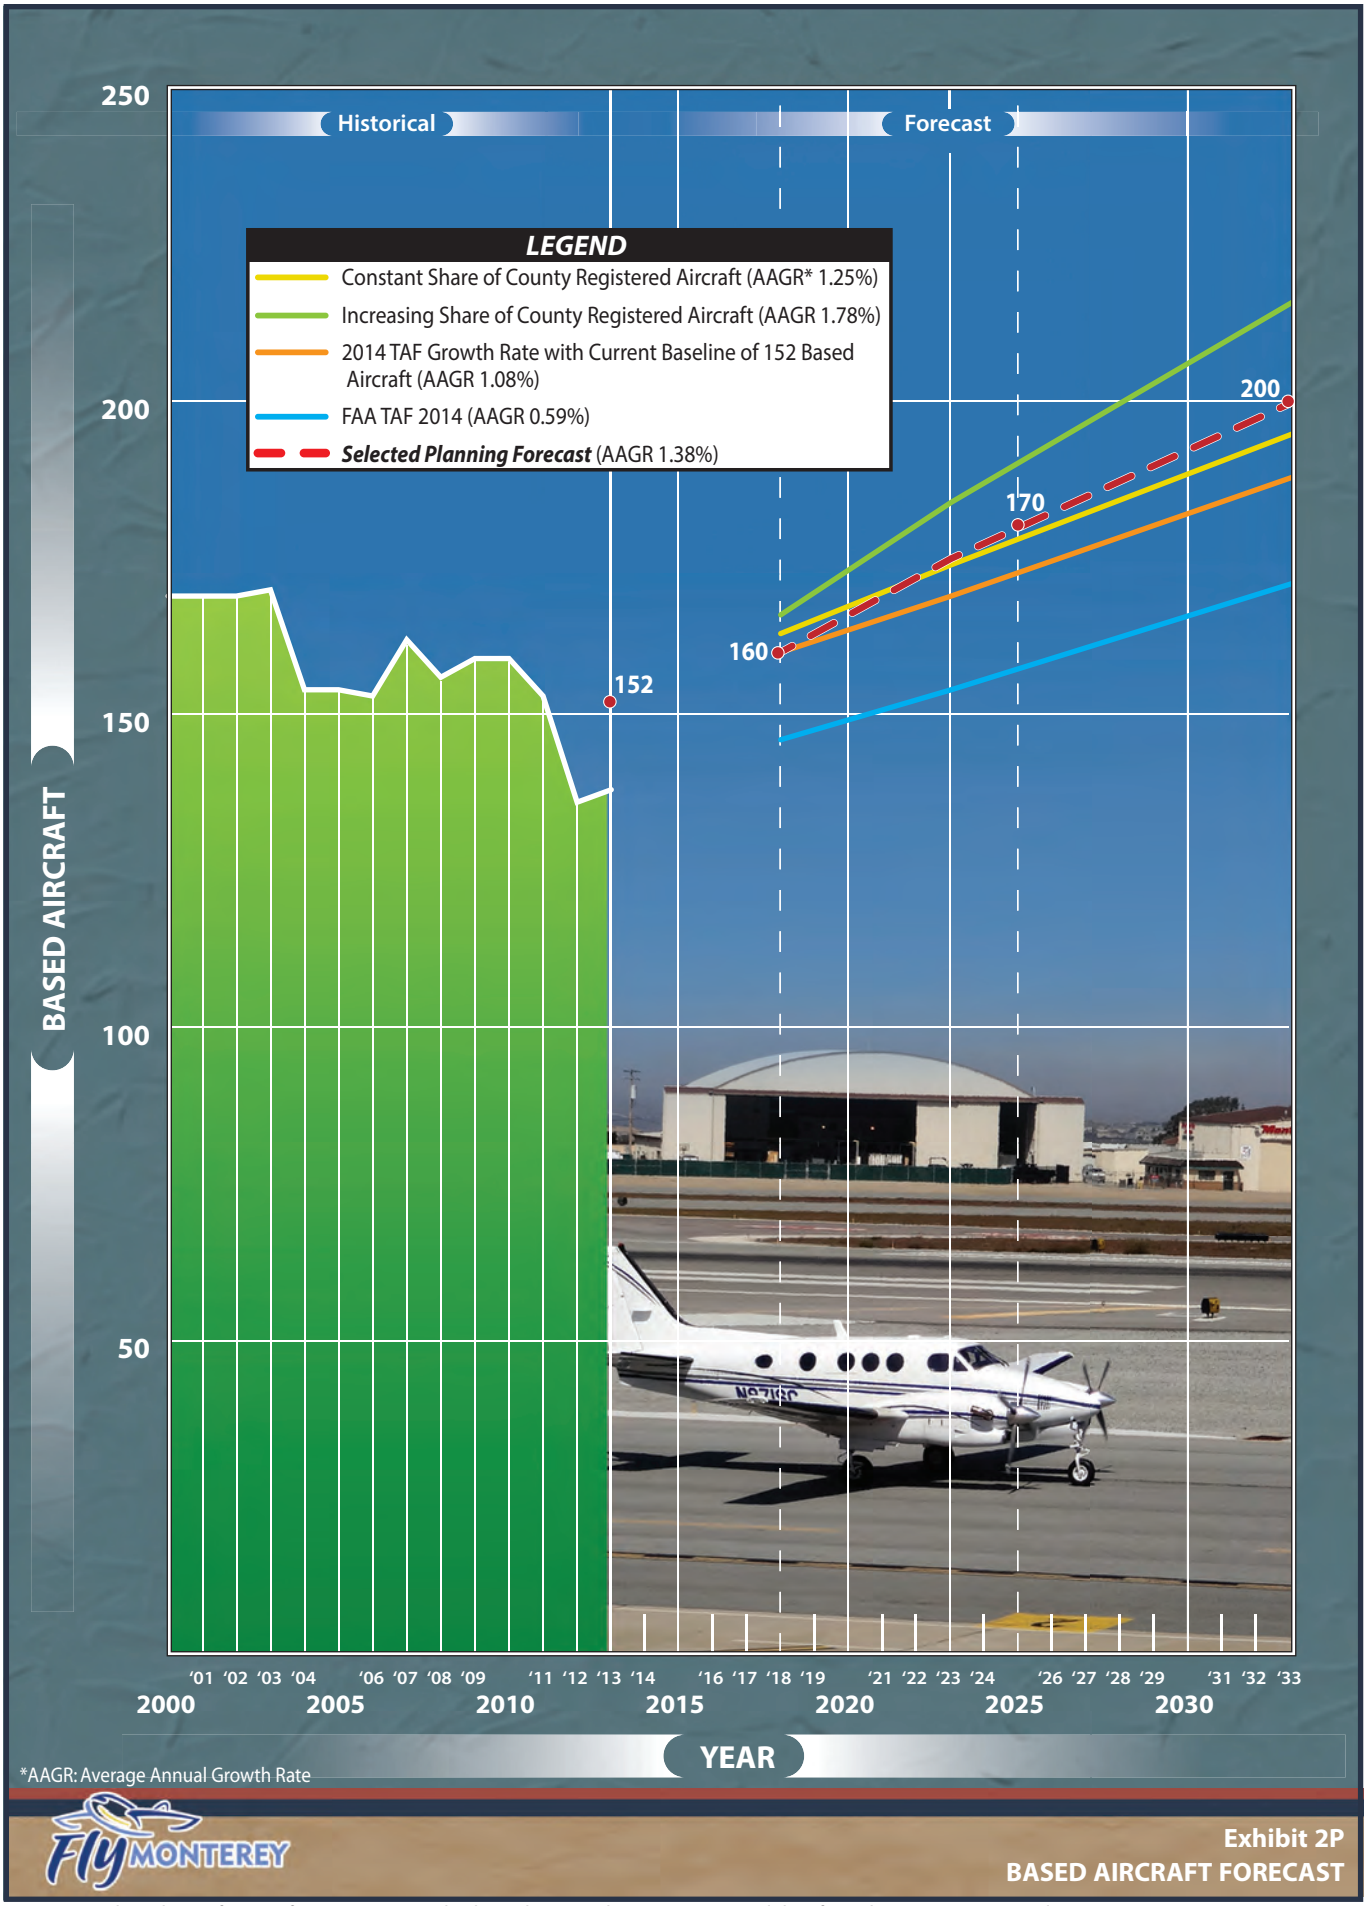
From 2000 through 2007, the Airport experienced more than 50,000 annual itinerant general aviation operations. With the onset of the 2008 recession and subsequent slow recovery, itinerant general aviation operations have steadily declined, reaching 25,270 in 2013.

The first two forecasts consider future itinerant general aviation operations in comparison to the Airport's market share of national itinerant general aviation operations as forecast by the FAA. The first forecast considers the Airport maintaining a constant market share (0.1790 percent) of national itinerant general aviation operations which yields 27,676 operations by 2033. The next considers the Airport beginning to regain market share with a modestly increasing share of national itinerant general aviation operations. By the long term, the increasing market share forecast results in 39,250 operations.

The next two projections consider the relationship between based aircraft and itinerant general aviation operations. In 2013, there were 166 itinerant general aviation operations per based aircraft. When maintaining this ratio, a forecast results in 33,250 itinerant general aviation operations by 2033. This represents an annual growth rate of 1.38 percent. The second forecast considers an increasing number of itinerant general aviation operations per based aircraft. By 2033, itinerant general aviation operations reach 44,000, which correspond to 220 operations per based aircraft and an annual growth rate of 2.81 percent.

The last new projection considers the Airport ultimately recapturing its high mark of itinerant general aviation operations, approximately 58,000, which was last achieved in 2006. This forecast results in an aggressive annual growth rate of 4.24 percent.

The 2014 FAA TAF also presents an itinerant general aviation operation forecast which is included in the table. The TAF forecasts a negative growth rate of -0.28 percent annually. This results in a 2033 itinerant general aviation operations projection of 23,896. The 20-year forecast from the TAF was exceeded as recently as 2013 and is, therefore, likely a very low estimate.



Notes: 2013 based aircraft count from airport records (through September 2013). Historical data from the 2014 FAA Terminal Area Forecast.

AAGR = Average Annual Growth Rate from 2013 to 2033
Source: Coffman Associates analysis

The selected planning forecast is an approximate average of the five new forecasts (excluding the FAA TAF). In the next five years, itinerant general aviation operations are forecast to reach 28,100. In 10 years, 31,300 itinerant general aviation operations are forecast and by 2033, 40,400 itinerant general aviation operations are projected. **Exhibit 2Q** presents both the itinerant and local general aviation operations forecast.

Local Operations

A similar methodology was utilized to forecast local general aviation operations. **Table 2X** depicts the history of local operations at the Airport and examines its historic market share of GA local operations at towered airports in the United States. Historical local operations range from a low of 4,660 in 2003 to a high of 14,644 in 2001. Over the last three years (2011-2013), the Airport has experienced more than 10,000 annual local general aviation operations.

As with national itinerant operations, local operations declined significantly beginning with the recession of 2008. By 2010, this decline had stabilized and growth returned by 2012. While local general aviation operations declined by 2.9 percent annually from 2000-2013, the FAA forecasts that growth will return and continue at an annual rate of 0.5 percent through 2033.

The first two forecasts of local general aviation operations consider the Airport's market share of national local general aviation operations as counted by the FAA. The first maintains the Airport's 2013 market share at 0.0930 percent resulting in 12,140 local general aviation operations by 2033. This is likely a lower end forecast due to the fact that as recently as 2012, the Airport experienced more than 11,000 local general aviation operations. This forecast results in an annual growth rate of 0.55 percent. The second forecast applies an increasing market share forecast. This forecast results in 17,223 local general aviation operations by 2033 and an annual growth rate of 2.33 percent.

The next two forecasts consider the relationship between based aircraft and local general aviation operations. In 2013, there were 72 local general aviation operations per based aircraft. When maintaining this as a constant, a 2033 forecast of 14,311 local general aviation operations results. This is an annual growth rate of 1.38 percent. An increasing market share forecast is also presented which considers up to 100 local general aviation operations per based aircraft. This forecast results in 20,000 operations by 2033 and an annual growth rate of 3.09 percent. This forecast likely represents a high end forecast as the Airport has not exceeded 15,000 local general aviation operations in the last 13 years.

The 2014 FAA TAF projection is also presented in the table. The TAF identifies a 2033 projection of 14,293 local general aviation operations. This is an annual growth rate of 1.38 percent.

Source: Coffman Associates analysis

The selected forecast is the approximate average of the four new forecasts presented. The planning forecast for local general aviation operations considers 11,800 by 2018, 12,800 by 2023, and 15,900 by 2033. The average annual growth rate is 1.92 percent.

AIR TAXI & MILITARY OPERATIONS FORECASTS

Air taxi operations include operations by for-hire aircraft with fewer than 60 passenger seats and/or less than 18,000 pounds payload. This will include many of the scheduled commercial service flights at Monterey Regional Airport. Some operations by aircraft operated under fractional ownership programs are also counted as air taxi operations. Air cargo and air ambulance activity is typically counted in the air taxi category as well. Since the airline and air cargo operations were forecast in the previous section, this section reviews the growth potential for the "other" air taxi operations at the Airport.

Exhibit 2M included the FAA forecasts for air taxi/commuter operations nationally. Following the national aviation trend, air taxi/commuter operations experienced a decline that corresponded with the recession years. From 2000-2012, air taxi/commuter operations declined at 1.5 percent annually, with the decline beginning in 2007. Unlike other sectors of aviation, the FAA projections indicate that air taxi/commuter operations may not return to a growth trend. In fact, the FAA's 2033 projection for air taxi/commuter operations is lower than that estimated for 2013. As a result, from 2013-2034, the FAA projects a negative growth rate of -0.1 percent annually.

According to ATCT records for 2013, there were 14,902 air taxi/commuter operations logged at the Airport. Of this total, Airport records indicate that approximately 72 percent were conducted by scheduled commercial airline service and four percent were conducted by air cargo carriers. The remaining 24 percent, or 3,610 operations, are classified in the "other" air taxi activity category which includes ultralights and lighter-than-air aircraft..

Historically, Monterey Regional Airport has had a high percentage of its overall operations included in the air taxi/commuter category. In 2000 and 2001, the Airport averaged nearly 30,000 air taxi/commuter operations. From 2002 through 2006, the Airport experienced a decline, averaging just over 22,000 air taxi/commuter operations. In 2007, the Airport had an increase to more than 25,500 operations, which was followed by the recession and a period of decline. By 2013, 14,902 air taxi/commuter operations were counted.

Air taxi forecasts have been prepared as a market share of all air taxi operations conducted at U.S. airports served by an ATCT. These forecasts are presented in **Table 2Y** and include the selected air taxi forecast.

The first air taxi/commuter forecast considers the Airport maintaining its 2013 market share (0.1693 percent) of national air taxi/commuter operations. Since 2013 represented the lowest number of air taxi/commuter operations recorded for the Airport, this forecast is likely the low end of the planning envelope. This forecast results in a negative growth rate of -0.20 percent. The next forecast considers an increasing market share with an an-

nual average growth rate of 1.56 percent. By 2033, this projection results in 20,317 air taxi/commuter operations.

TABLE 2Y
Air Taxi Operations Forecasts
Monterey Regional Airport

Year	MRY Air Taxi Operations[1]	U.S. ATCT Air Taxi Operations[2]	MRY Percent
2000	29,650	10,760,500	0.2755%

2033	19,300	8,465,500	0.2280%

[1]Historical data from ATCT records as reported to FAA in calendar years.
[2]FAA Forecasts 2014-2034
AAGR = Average Annual Growth Rate from 2013 to 2033
Source: Coffman Associates analysis

A third projection was developed that considers the Airport recapturing the average number of air taxi/commuter operations experienced from 2002 through 2007. This is the period immediately before the national recession. This forecast results in 23,000 air taxi/commuter operations by 2033 and an annual average growth rate of 2.19 percent.

The 2014 FAA TAF for air taxi/commuter operations at the Airport is also presented in the table. The TAF projects 17,891 air taxi/commuter operations by 2033 for an annual average growth rate of 0.92 percent.

The selected forecast is an approximate average of the three new forecasts presented (excluding the FAA TAF). By 2018, a total of 15,300 air taxi/commuter operations are forecast. By 2033, a total of 19,300 air taxi/commuter operations are forecast. The average annual growth rate of the selected planning forecast is 1.30 percent.

MILITARY ACTIVITY

Military pilots are free to utilize civilian airports across the country and, as such, Monterey Regional Airport experiences some activity by the military. In 2013, there were 1,717 military operations. This total represents the highest level the Airport has experienced since at least 2000. The Airport has experienced an increasing level of military activity every year since 2009. This is a phenomenon being experienced at airports across the country and is attributable to the fact that the various overseas military commitments are drawing to a close, which brings military pilots home for continued training.

Developing a reliable forecast of military activity at civilian airports is inherently difficult primarily because the military mission can change rapidly. Generally, during peace time civilian airports will experience higher levels of military operations. When there are overseas commitments, many of those pilots and equipment will be out of the country. The FAA recognizes these challenges to forecasting military activity and, therefore, provides only a flat forecast for both local and itinerant military activity.

Table 2Z presents the history of military activity at Monterey Regional Airport. The forecast presented considers a zero growth scenario of 1,500 annual operations. These operations are then categorized as either local or itinerant based on historical averages.

TABLE 2Z
Military Operations Forecast
Monterey Regional Airport

Year	Military Itinerant	Military Local	Total
2000	807	203	1,010
2001	827	254	1,081
2002	977	293	1,270
2003	822	64	886
2004	947	116	1,063
2005	821	129	950

COMPARISON TO THE FAA TAF

The FAA will review the forecasts presented in this master plan for comparison to the *Terminal Area Forecast*. The local Airports District Office (ADO) of the FAA can approve the forecasts if they do not differ by more than 10 percent in the first five years and 15 percent for years 6-10. If the master planning forecasts exceed these parameters, then the forecasts must be forwarded to FAA headquarters in Washington, D.C. for further review. Any deviation from these thresholds will require specific local documentation. **Table 2AA** presents the direct comparison of the master planning forecasts with the TAF published in January 2014.

The reason the FAA allows this differential is because the TAF forecasts are not meant to replace forecasts developed locally (i.e. in this Master Plan). While the TAF can provide a point of reference or comparison, their purpose is much broader in defining FAA national workload measures.

TABLE 2AA
Forecast Comparison to the 2014 FAA Terminal Area Forecast (TAF)
Monterey Regional Airport

	2013	2018	2023	2028	2033	AAGR 2013-2033
Passenger Enplanements

Source: Coffman Associates analysis

In the five-year planning horizon, all forecasting categories included in the TAF are within 10 percent of the forecasts developed in this master planning effort. In the 10-year planning horizon, all forecasting categories included in the TAF are within 15 percent of the TAF.

PEAKING CHARACTERISTICS

Many airport facility needs are related to the levels of activity during peak periods. The periods used in developing facility requirements for this study are as follows:

- **Peak Month** – The calendar month when peak aircraft operations occur.
- **Design Day** – The average day in the peak month. This indicator is easily derived by dividing the peak month operations by the number of days in a month.
- **Busy Day** – The busy day of a typical week in the peak month.
- **Design Hour** – The peak hour within the design day.

It is important to note that only the peak month is an absolute peak within a given year. All other peak periods will be exceeded at various times during the year. However, they do represent reasonable planning standards that can be applied without overbuilding or being too restrictive.

AIRLINE PEAKING

Airport capacity and facility needs related to commercial service operations typically consider the levels of activity during a peak or design period. Determination of peaking characteristics related to airline activity is important for the planning and design of passenger terminal services. This includes the appropriate size of the terminal building and the functional areas therein. Terminal building elements include hold rooms, security checkpoints, concessions, restrooms, baggage claim area, etc. The airline peaking characteristics also relate to aircraft gates, ramp apron space, and overnight parking.

Between 2003 and 2013, the peak month enplanement totals have averaged approximately 9.6 percent of the annual enplaned passengers. For planning purposes, the future peak month enplanement level is estimated at 9.6 percent of annual forecasted enplanements.

The design day enplanement level for the peak month is essentially the average weekday enplanements of the peak month. Typically, this is derived by dividing the peak month enplanement level by the number of days in the month. Since 2003, the peak month enplanement level has occurred in a month with 31 days: July, August, or October. Therefore, the design day is determined by dividing the peak month by the number of days in the month, 31 in this case.

The design hour enplanement estimate is based on the current (February 2014) airline schedule at the Airport. According to the schedule, the hourly peak for departures was five which occurs in the early morning between 5:15 and 6:15 am. The combination of these aircraft provides 227 available seats. Utilizing the current average board loading factor (BLF) of 72 percent, plus a buffer of 20 additional seats, a design hour of 183 is determined.

The design hour is approximately 31 percent of the design day. This factor is carried over to the forecast years. It should be noted that, at times, the design hour may be much higher. For example, in the recent past, Allegiant Airlines has scheduled the arrival of their 150-seat MD-80 series aircraft at the existing peak hour for other commercial operations.

The average peak month for airline operations is 9.2 percent of total annual airline operations. The current design day for operations is known from the flight schedule. There are, on average, 15 commercial arrivals and 15 commercial departures per day; therefore, the current daily airline operations count is 30. Future design day operations forecasts are a function of daily airline operations and are based on the forecast fleet mix, BLF, and schedule (See Table 2P). Design hour operations include both arrival and departure activity.

GENERAL AVIATION PEAKING

The peak month of general aviation operations at Monterey Regional Airport has averaged 9.97 percent of the yearly total for the last five years. The peak month for general aviation operations at the Airport typically occurs in late summer and early fall. The peak month for the forecast years was determined by applying a factor of 9.97 to general aviation operations. The design day was determined by dividing the peak month operations by 31 (the number of days in the peak month).

The 2013 design hour was determined from hourly operations records maintained by the ATCT for the peak month of 2013 (August). The design hour was calculated as the average of the peak hour of the peak day of each week in August 2013. The design hour calculated to 13.85 percent of the design day, which was carried forward to the forecast years.

TOTAL OPERATIONS PEAKING

The total operations peak periods are utilized in examining the capacity of the airfield. The peak month of total operations has averaged 9.8 percent of total annual operations over the last five years, typically occurring during the summer months. **Table 2BB** outlines the peak period forecasts for total airport operations.

ANNUAL INSTRUMENT APPROACHES

Forecasts of annual instrument approaches (AIAs) provide guidance in determining an airport's requirements for navigational aid facilities. An instrument approach as defined by the FAA is "an approach to an airport with intent to land by an aircraft in accordance with an instrument flight rules (IFR) flight plan, when visibility is less than three miles and/or when the ceiling is at or below the minimum initial approach altitude."

Historical data on instrument approaches (under IFR conditions) to the Airport is not readily available. Therefore, an estimate of AIAs was prepared based upon information from

similar airports. The number of AIAs was calculated for the planning period by utilizing 50 percent of itinerant operations (to concentrate on arrivals), times the percentage of estimated IFR conditions (28 percent). The AIA projections are presented on **Table 2CC**.

FORECAST SUMMARY

This chapter has outlined the various activity levels that might reasonably be anticipated over the planning period. **Exhibit 2R** is a summary of the aviation forecasts prepared in this chapter. Actual activity is included for 2013, which was the base year for these forecasts.

In 2013, the Airport exceeded 200,000 passenger enplanements for the first time since 2008. Enplanements have increased each year over previous years since 2010. Enplane-

FLY MONTEREY

Exhibit 2R
FORECAST SUMMARY

ments are forecast to reach 223,000 within the next five years and 275,000 within 20 years. Overall, Airport operations are forecast to continue to grow from 53,827 in 2013 to 80,600 by 2033. Based aircraft are forecast to grow from 152 in 2013 to 200 by 2033.

Naturally, projections of aviation demand will be influenced by unforeseen factors. In the recent past, factors such as the terrorist attacks of September 11, 2001, and two economic recessions impacted aviation demand. Nonetheless, the forecasts developed for this master planning effort are considered reasonable for planning purposes. The FAA will review and, if acceptable, approve these forecasts for planning purposes.

AIRCRAFT/AIRPORT/RUNWAY CLASSIFICATION

The FAA has established several aircraft classification systems that group aircraft types based on their performance (approach speed in landing configuration) and on design characteristics (wingspan and landing gear configuration). These classification systems are used to determine the appropriate airport design standards for specific airport elements such as runways, taxiways, taxilanes, and aprons.

AIRCRAFT CLASSIFICATION

The selection of appropriate FAA design standards for the development and location of airport facilities is based primarily upon the characteristics of the aircraft which are currently using or are expected to use an airport. The critical design aircraft is used to define the design parameters for an airport. The design aircraft may be a single aircraft type or, more commonly, is a composite aircraft representing a collection of aircraft classified by three parameters: Aircraft Approach Category (AAC), Airplane Design Group (ADG), and Taxiway Design Group (TDG). FAA AC 150/5300-13A, *Airport Design*, describes the following airplane classification systems, the parameters of which are presented on **Exhibit 2S**.

Aircraft Approach Category (AAC): A grouping of aircraft based on a reference landing speed (V_{REF}), if specified, or if V_{REF} is not specified, 1.3 times stall speed (V_{SO}) at the maximum certificated landing weight. V_{REF}, V_{SO}, and the maximum certificated landing weight are those values as established for the aircraft by the certification authority of the country of registry.

The AAC generally refers to the approach speed of an aircraft in landing configuration. The higher the approach speed, the more restrictive the applicable design standards. The AAC, depicted by a letter A through E, is the aircraft approach category and relates to aircraft approach speed (operational characteristic). The AAC generally applies to runways and runway-related facilities such as runway width, runway safety area (RSA), runway object free area (ROFA), runway protection zone (RPZ), and separation standards.

Airplane Design Group (ADG): The ADG, depicted by a Roman numeral I through VI, is a classification of aircraft which relates to aircraft wingspan or tail height (physical charac-

teristic). When the aircraft wingspan and tail height fall in different groups, the higher group is used. The ADG influences design standards for taxiway safety area (TSA), taxiway object free (TOFA), taxilane object free area, apron wingtip clearance, and various separation distances.

Taxiway Design Group (TDG): A classification of airplanes based on outer-to-outer Main Gear Width (MGW) and Cockpit to Main Gear (CMG) distance. The TDG relates to the undercarriage dimensions of the design aircraft. The taxiway design elements determined by the application of the TDG include the taxiway width, taxiway edge safety margin, taxiway shoulder width, taxiway fillet dimensions, and, in some cases, the separation distance between parallel taxiways/taxilanes. Other taxiway elements such as the taxiway safety area (TSA), taxiway/taxilane object free area (TOFA), taxiway/taxilane separation to parallel taxiway/taxilanes or fixed or movable objects, and taxiway/taxilane wingtip clearances are determined solely based on the wingspan (ADG) of the design aircraft utilizing those surfaces. It is appropriate for taxiways to be planned and built to different TDG standards based on expected use.

Exhibit 2T summarizes the classification of the most common jet aircraft in operation today. Generally, business jets will fall in approach categories B and C, while commercial aircraft will fall in C and D. Business jets typically have slower approach speeds as compared to commercial transport aircraft. Recreational and business piston and turboprop aircraft will generally fall in approach categories A and B and airplane design groups I and II.

AIRPORT AND RUNWAY CLASSIFICATION

These classifications, along with the aircraft classifications defined previously, are used to determine the appropriate FAA design standards to which the airfield facilities are to be designed and built.

***Airport Reference Code (ARC)*:** An airport designation that signifies the airport's highest Runway Design Code (RDC), minus the third (visibility) component of the RDC. The ARC is used for planning and design only and does not limit the aircraft that may be able to operate safely on the airport. The current Airport Layout Plan (ALP) for the airport, which will be updated as part of this master planning effort, identifies an ARC of D-III for the Airport currently with an ultimate ARC of D-IV.

Runway Design Code (RDC): A code signifying the design standards to which the runway is to be built. The RDC is based upon planned development and has no operational component.

The AAC, ADG, and runway visual range (RVR) are combined to form the RDC of a particular runway. The RDC provides the information needed to determine certain design standards that apply. The first component, depicted by a letter, is the AAC and relates to aircraft approach speed (operational characteristics). The second component, depicted by a Roman numeral, is the ADG and relates to either the aircraft wingspan or tail height (physical

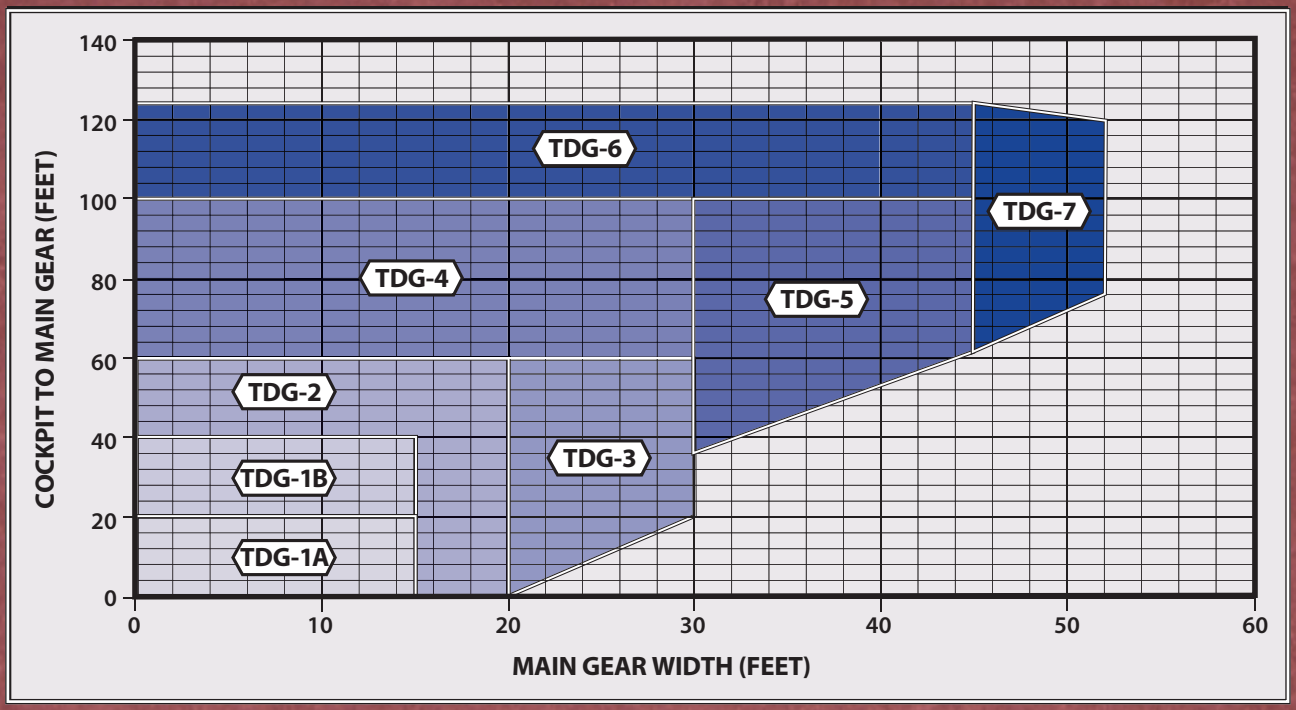
AIRCRAFT APPROACH CATEGORY (AAC)	
Category	**Approach Speed**
A	less than 91 knots
B	91 knots or more but less than 121 knots
C	121 knots or more but less than 141 knots
D	141 knots or more but less than 166 knots
E	166 knots or more

AIRPLANE DESIGN GROUP (ADG)		
Group #	**Tail Height (ft)**	**Wingspan (ft)**
I	<20	<49
II	20-<30	49-<79
III	30-<45	70-<118
IV	45-<60	118-<171
V	60-<66	171-<214
VI	66-<80	214-<262

VISIBILITY MINIMUMS	
RVR* (ft)	**Flight Visibility Category (statute miles)**
VIS	3-mile or greater visibility minimums
5,000	Not lower than 1-mile
4,000	Lower than 1-mile but not lower than ¾-mile
2,400	Lower than ¾-mile but not lower than ½-mile
1,600	Lower than ½-mile but not lower than ¼-mile
1,200	Lower than ¼-mile

***RVR**: Runway Visual Range

TAXIWAY DESIGN GROUP (TDG)



FLY MONTEREY

Exhibit 2S
AIRCRAFT CLASSIFICATION PARAMETERS

Source: FAA AC 150/5300-13A, Airport Design

characteristics), whichever is most restrictive. The third component relates to the visibility minimums expressed by RVR values in feet of 1,200 (⅛-mile), 1,600 (¼-mile), 2,400 (½-mile), 4,000 (¾-mile), and 5,000 (1-mile). The RVR values approximate standard visibility minimums for instrument approaches to the runways. The third component should read "VIS" for runways designed for visual approach use only.

Approach Reference Code (APRC): A code signifying the current operational capabilities of a runway and associated parallel taxiway with regard to landing operations. Like the RDC, the APRC is composed of the same three components: the AAC, ADG, and RVR. The APRC describes the current operational capabilities of a runway under particular meteorological conditions where no special operating procedures are necessary, as opposed to the RDC which is based upon planned development with no operational component. The APRC for a runway is established based upon the minimum runway to taxiway centerline separation.

Departure Reference Code (DPRC): A code signifying the current operational capabilities of a runway and associated parallel taxiway with regard to takeoff operations. The DPRC represents those aircraft that can takeoff from a runway while any aircraft are present on adjacent taxiways, under particular meteorological conditions with no special operating conditions. The DPRC is similar to the APRC, but is composed of two components, ACC and ADG. A runway may have more than one DPRC depending on the parallel taxiway separation distance.

CRITICAL DESIGN AIRCRAFT

The selection of appropriate FAA design standards for the development and location of airport facilities is based primarily upon the characteristics of the aircraft which are currently using or are expected to use an airport. The critical design aircraft is used to define the design parameters for an airport. The design aircraft may be a single aircraft or a composite aircraft representing a collection of aircraft classified by the three parameters: AAC, ADG, and TDG. In the case of an airport with multiple runways, a design aircraft is selected for each runway.

The first consideration is the safe operation of aircraft likely to use an airport. Any operation of an aircraft that exceeds design criteria of an airport may result in either an unsafe operation or a lesser safety margin; however, it is not the usual practice to base the airport design on an aircraft that uses the airport infrequently.

The design aircraft is defined as the most demanding category of aircraft, or family of aircraft, which conducts at least 500 itinerant operations per year at an airport or the most demanding aircraft in regularly scheduled commercial service. Planning for future aircraft use is of particular importance since the design standards are used to plan separation distances between facilities. These future standards must be considered now to ensure that short term development does not preclude the reasonable long range potential needs of the airport.

This page intentionally left blank

According to FAA AC 150/5300-13A, *Airport Design*, "airport designs based only on existing aircraft can severely limit the ability to expand the airport to meet future requirements for larger, more demanding aircraft. Airport designs that are based on large aircraft never likely to be served by the airport are not economical." Selection of the current and future critical design aircraft must be realistic in nature and supported by current data and realistic projections.

AIRPORT DESIGN AIRCRAFT

The Airport experiences frequent activity by both commercial service and business jets. The largest commercial service jet currently in service at the Airport is the Boeing MD88 as operated by Allegiant Air. The Airport experiences activity by the largest business jets including the Gulfstream V and Bombardier Global Express.

The FAA maintains the Traffic Flow Management System Count (TFMSC) database which documents certain aircraft operations at certain airports. Information is added to the TFMSC database when pilots file flight plans and/or when flights are detected by the National Airspace System, usually via radar. It includes documentation of commercial traffic (air carrier and air taxi), general aviation, and military aircraft. Due to factors such as incomplete flight plans and limited radar coverage, TFMSC data does not account for all aircraft activity at an airport by a given aircraft type. Therefore, it is likely that there are more operations (touch and go's, for example) at the airport than are captured by this methodology. TFMSC data is available for activity at Monterey Regional Airport and was utilized in this analysis.

Exhibit 2U presents the TFMSC activity for the calendar year 2013 at the Airport. Aircraft in AAC D accounted for 770 operations and aircraft in ADG III accounted for 1,684 operations. Both of these categories exceed the 500 operations threshold. Aircraft classified in C-IV do occasionally operate at the Airport, but total operations by these aircraft have not reached the FAA's critical aircraft threshold in the recent past. The current design aircraft for the Airport is those falling in AAC/ADG D-III. A representative aircraft would be the Boeing MD88. The TDG of this aircraft is 4. **Therefore, the current design aircraft for the airport is best described as D-III-4.** Where practicable, planning should not preclude the future capability of the Airport to accommodate ARC D-IV.

As the airline fleet mix transitions away from the 50-seat regional jets towards 70-plus seat regional jets, the Airport's share of ARC C-III (e.g., Embraer 170 & 190) and D-II (e.g., CRJ 900) classified aircraft are projected to grow. Additionally, with continued operational growth of larger business jets, operations in the ARC D-III category are expected to increase through the planning period as well.

RUNWAY DESIGN AIRCRAFT

Each runway is assigned an RDC. The RDC relates to specific FAA design standards that should be met in relation to each runway.

FLY MONTEREY

Exhibit 2U
OPERATIONS FORECAST BY FLEET MIX

Source: 2013 figures interpolated from calendar year as reported by the FAA's Traffic Flow Management System Counts (TFMSC) database to match ATCT operational counts as reported by the FAA.

Runway 10R-28L Design Aircraft

Runway 10R-28L is the primary runway and should be designed to accommodate the critical design aircraft. This runway is currently 7,603 feet long (7,175 upon completion of the runway safety area project currently underway) and has an instrument landing system providing ½-mile visibility minimums for instrument approaches to Runway 10R. **Therefore, the applicable RDC is D-III-2400**. This RDC determination is supported by current activity levels as determined previously, and it corresponds to the airport reference code identified on the previous airport layout plan (ALP).

Runway 10L-28R Design Aircraft

Runway 10L-28R is the shorter parallel runway measuring 3,504 feet long and 60 feet wide. This runway is utilized by operators of small aircraft, those under 12,500 pounds. Instrument approaches with visibility minimums of 1¼-mile are available to both runway ends. **The RDC for Runway 10L-28R is A/B-I-5000 (small aircraft exclusively).**

FUTURE DESIGN AIRCRAFT

As documented previously, operations are forecast to grow over the 20-year planning horizon; however, the mix of aircraft types is anticipated to remain largely unchanged. The airport will continue to be utilized by all sectors of aviation including air carrier, air taxi, general aviation, and military. The frequency of these operations may increase somewhat, but the category of the design aircraft for the Airport and each runway is not anticipated to change. **Therefore, the overall design aircraft for the airport will remain D-III-4 as represented by the Boeing MD88 aircraft.**

The AAC and ADG design components for each Runway RDC are anticipated to remain unchanged. The RVR (visibility component) may change based on analysis and recommendations regarding potential instrument approach capability.

SUMMARY

This chapter has presented aviation demand forecasts as projected over the next 20 years for the Airport. Following input from the Planning Advisory Committee, the forecasts will be provided to FAA for their review. The next step in the master plan is to reassess the capacity of the existing facilities and determine what facilities will be necessary to meet both existing and future demands. The Facility Requirements chapter will be developed utilizing the forecasts of aviation demand.

MONTEREY REGIONAL AIRPORT TAXIWAY "A" RELOCATION RISK ASSESSMENT

November 4, 2015

Mr. Mark Bautista, AAE
Deputy General Manager
MONTEREY PENINSULA AIRPORT DISTRICT
Planning and Development
200 Fred Kane Drive, Suite 200
Monterey, CA 93940

RE: Monterey Regional Airport – Taxiway "A" Relocation Risk Assessment

Dear Mark,

The purpose of this letter is to present the results of a risk assessment for the relocation of a portion of parallel Taxiway "A" which is located south of Runway 10R-28L at the Monterey Regional Airport (MRY). This risk assessment was requested during a June 16, 2015 MRY Airport Master Plan briefing meeting with the Airports Division Manager of the Federal Aviation Administration's (FAA's) Western-Pacific Region and his staff. As outlined below, increasing the runway centerline to taxiway centerline distance from 275 feet to 327.5 feet reduces the risk to less than 1.E-07 (1 accident per 10,000,000 landings) and would be considered acceptable to the FAA for purposes of issuing a Modification of Airfield Separation Standards.

Background

As part of the ongoing Airport Master Plan for the Monterey Regional Airport, one of the major issues that needed to be addressed is the 275 foot centerline-to-centerline separation distance between Runway 10R-28L and a ±2,800 foot portion of Taxiway "A" between exit Taxiways "E" and "K". Because this portion of Taxiway "A" is only 275 feet from the runway centerline, the wingtips of aircraft with wingspans greater than 50 feet operating on Taxiway "A" penetrate the Runway Safety Area (RSA) of Runway 10R-28L. In addition, the Hold Line locations for Taxiways "F", "G", "J", and "K" are located at 200 feet from the centerline of Runway 10R-28L, and are inside the RSA.

According to FAA Advisory Circular (AC) 150/5300-13A (Change 1), the runway centerline to parallel taxiway centerline separation should be 400 feet. However, during the evaluation of alternatives for the Airport Master Plan, it was determined that is was not practicable, or feasible, to relocate Taxiway "A" to the 400 foot separation distance due to various engineering and environmental issues. As a result, the recommendation was to relocate the ±2,800 foot section of

Taxiway "A" to 327.5 feet which would then be consistent with the separation distance of the balance of Taxiway "A". Moving the ±2,800 foot section of Taxiway "A" to 327.5 feet would ensure that Airplane Design Group (ADG) III aircraft (wingspans less than 118 feet) could taxi the full length of Taxiway "A" and their wingtips would not penetrate the RSA. In addition, the Hold Line locations for Taxiways "F", "G", "J", and "K" could be moved to 250 feet and remain outside of the RSA. Correcting the RSA issue by relocating a portion of Taxiway "A", however, would limit the apron space available for parking and maneuvering of commercial passenger aircraft directly in front of the existing Passenger Terminal Building. The limited apron space as well as the age (60 plus years) and condition of the Terminal Building resulted in the additional master plan recommendation to construct a new Terminal Building in a new and better location.

Methodology

Because the 327.5 foot runway centerline-taxiway centerline distance does not meet the 400 foot separation distance recommended by FAA's AC, a Modification of Standards (MOS) will need to be approved by the FAA. During a recent meeting between the FAA and the Monterey Peninsula Airport District staff to discuss this issue, FAA requested that the Airport District analyze the reduction of risk associated with moving the ±2,800 portion Taxiway "A" to the 327.5 distance. Because FAA does not provide any specific guidance on how to quantify the risk associated with the separation between a runway centerline and a parallel taxiway centerline, it was decided that the use of Airport Cooperative Research Program (ACRP) Report 51 (***Risk Assessment Method to Support Modification of Airfield Separation Standards***) would provide the appropriate guidance. According to ACRP Report 51:

"*The Risk Assessment Method to Support Modification of Airfield Separation Standards provides a methodology that airports can use to support their request for modification of standards. It is intended to be used in those circumstances where the design criteria for separations between taxiways/taxilanes and (1) other taxiways/taxilanes and (2) fixed or movable objects as well as separations between taxiways and runways cannot be met. This risk-based methodology will be useful to airport staff and their consultants as they assess the risks associated with non-standard separations at existing constrained airports where the standards can't be practicably met.*"

ACRP Report 51 further states:

"What is the risk if larger aircraft are allowed to operate at these airports with non-standard separations? Currently, there are no risk-based methodologies for assessing such risks, and each situation is treated as a unique case. The FAA may allow operations at airports that do not comply with minimum separation distances by evaluating an MOS submitted by the airport operator. The objective is to keep the airport/aircraft operations at a level of safety equivalent to that achieved by standard separations."

The objective of ACRP Report 51 research effort was to develop a simple and practical methodology for assessing the risk of aircraft collisions associated with non-standard airfield separations. The tool which was developed for analysis is intended to support MOS requests for non-standard separations. The methodology is based on the probability of lateral and vertical deviations from the intended path during landing, takeoff, and taxiing operations. A series of risk

plots based on centerline or wingtip separations is provided for each Aircraft Design Group (ADG), and step-by-step procedures are described for each type of separation involved in the analysis, such as runway and taxiway, and taxiway and taxiway. The methodology was validated using actual MOS cases approved by the FAA that covered a spectrum of scenarios, airports, and FAA regions. Relevant information was gathered by the ACRP consultant for each case to characterize the non-standard situation and was analyzed using the methodology developed in this study. Risk criteria were suggested based on the risk matrix used by the FAA in safety management systems, on the evidence of accident and incident rates, and the consequences gathered in this research effort.

Risk Assessment Results

Based on the guidance provided in ACRP Report 51, two (2) risk assessment scenarios for Monterey Regional Airport were evaluated. The first scenario (Scenario #1) provided an assessment of the risk associated with keeping the centerline of the ±2,800 foot segment of parallel Taxiway "A" in its present location which is 275 feet from the centerline of Runway 10R-28L. The second scenario (Scenario #2) provides an assessment of the risk associated with relocating the same segment of parallel Taxiway "A" to 327.5 feet. According to the ACRP Report 51, two segments of the aircraft's flight should be evaluated: the segment associated with the airborne (approach) phase, and the ground phase associated with the landing rollout of the aircraft. The takeoff phase is not evaluated because the highest risk condition is for landing. Figure AA-33 of the ACRP Report was used to estimate the risk of collision for the approach phase for Aircraft Design Group III aircraft utilizing a Category I Instrument Landing System (ILS). Figure AA-43 of the ACRP Report was used to estimate the risk of collision for the landing roll-out phase for Aircraft Design Group III aircraft.

Scenario #1 (275 foot separation)

- Probability of an accident during the airborne (approach) phase: 1 accident per 588,235,294 landings (1.7E-9)
- Probability of an accident during the ground (landing rollout) phase: 1 accident per 7,692,307 landings (1.3E-7).

Scenario #2 (327.5 foot separation)

- Probability of an accident during the airborne (approach) phase: 1 accident per 1,333,333,333 landings (7.5E-10).
- Probability of an accident during the ground (landing rollout) phase: 1 accident per 12,048,192 landings (8.3E-8).

According to the ACRP Report, FAA's acceptable level of risk is considered to be less than 1 accident per 10,000,000 landings (1.E-07). As outlined above, the risk associated with the approach phase for both Scenarios is less than 1.E-07. The existing risk for the landing rollout phase is greater than 1.E-07 for Scenario #1 (275 foot separation) and is considered by FAA to be unacceptable. However, increasing the separation to 327.5 feet reduces the risk to less than

1.E-07 and would be considered acceptable to the FAA for purposes of issuing a Modification of Standards.

Conclusions

Increasing the separation distance from the centerline Runway 10R-28L to the centerline of Taxiway "A" from 275 feet to 327.5 feet reduces the probability of an accident during the airborne (approach) phase by approximately 127 percent. In both cases, the level of risk is less than 1 accident per 10,000,000 landings. However, for the landing rollout phase, the increase in separation distance reduces the probability of an accident by approximately 57 percent and the level of risk is reduced from greater than 1 accident per 10,000,000 landings (**unacceptable**) to less than 1 accident per 10,000,000 landings (**acceptable**). As a result, based on the significant increase in safety resulting from the change in separation distances, the FAA should support a Modification of Airfield Separation Standards for the increase of runway to parallel taxiway centerline separation distance of 327.5 feet.

If you have any questions regarding this evaluation, or if you need additional information, please don't hesitate to give me a call.

Sincerely,

James M. Harris
President

FAA TAXIWAY SEPARATION WAIVER (MONTEREY REGIONAL AIRPORT)

DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

DATE: AUG 4 1976

IN REPLY REFER TO: SFO-621: MRY-04C

SAN FRANCISCO AIRPORT DISTRICT OFFICE
831 Mitten Road
Burlingame, California 94010

SUBJECT: Monterey (California) Peninsula Airport; Waiver of Standards for Runway - Taxiway Centerline Separation

FROM: SFO-600

TO: Mr. O. N. Ford
District Manager
Monterey Peninsula Airport District
P.O. Box 550
Monterey, California 93940

This is in response to your letter (C. B. Neill, May 19, 1976) regarding the proposed alignment of the south parallel taxiway extension to the west end of Runway 10. The proposed alignment as shown on the preliminary plans submitted on June 8, 1976 is approved.

This waiver of standard taxiway - runway separation requirements is subject to the development of satisfactory procedures to prevent large aircraft (B-737 and larger) from using the segment of taxiway with 277.5 ft. separation when another large aircraft is operating on Runway 10/28. If serious operational problems develop because of the reduced separation, realignment of the taxiway to a greater separation will be necessary. Also, general aviation parking in front of Del Monte Aviation must be controlled to provide adequate wingtip clearance for taxiing large aircraft.

FREDERICK M. ISAAC
Chief, Airport District Office, SFO-600

DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

Airport District Office
831 Mitten Road
Burlingame, Calif. 94010

JUN 19 1978

Mr. O.N. Ford
District Manager
Monterey Peninsula Airport District
P.O. Box 550
Monterey, CA 93940

Subject: Monterey (California) Peninsula Airport; Waiver of Standards for Runway-Taxiway Centerline Separation

Dear Mr. Ford:

The proposed alignment of the south parallel taxiway extension as shown on your plans for ADAP Project No. 6-06-0159-06, dated June, 1978 is approved.

This waiver of runway-taxiway centerline separation standards is subject to the same conditions as those presently governing operations on the existing reduced separation taxiway segment.

That is, large aircraft (B-737 and larger) cannot use the segment of taxiway with 277.5 feet separation when another large aircraft is operating on Runway 10/28.

Sincerely,

LES HOPKINS
Chief, Planning Section

FREDERICK M. ISAAC
Chief, Airport District Office

Appendix E

AIR POLLUTANT AND GREENHOUSE GAS EMISSIONS MODELING REPORTS

APPENDIX E
AIR POLLUTANT AND GREENHOUSE GAS EMISSIONS MODELING REPORTS

Introduction

This appendix includes the California Emissions Estimator Model (CalEEMod) Version 2016.3.2 and the Federal Aviation Administration (FAA) Aviation Environmental Design Tool (AEDT) air pollutant emissions and greenhouse gas modeling summary reports.

CalEEMod

The CalEEMod software model, published by the California Air Pollution Officers Association (CAPCOA) in collaboration with various California air districts, estimates on-road vehicle emissions, such as those from dump trucks or light-duty work trucks, and off-road vehicle emissions, such as heavy construction equipment. The modeling results also include emissions resulting from earthmoving (e.g., grading and site preparation), structure demolition, and building construction. CalEEMod inputs for worker trips, haul trips, equipment activity, disturbed ground surface area, and material quantities are based on engineering estimates for each component of the project and its construction schedule. CalEEMod includes emissions factors that are adjusted to local climatic conditions in the area overseen by Monterey Bay Air Resources District (MBARD).

CalEEMod reports are provided for construction of new buildings associated with the Proposed Project and Alternative 1. CalEEMod reports are also provided for operation of existing and future buildings associated with the Proposed Project and Alternative 1. Modeling input assumptions are also included in the output reports following this introduction.

It should be noted that airport land uses are not included in CalEEMod. Therefore, similar land uses were selected to represent the existing facilities. Specifically, the approximate 70,000-square foot (sf) existing terminal is represented by 11,200 sf of light industrial space and 58,800 sf of government office space in CalEEMod. For the ARFF, a public facility land use, with 8,400 sf of building space, was selected. The southeast hangar areas were modeled using light industrial land uses totally approximately 126,000 sf. The model year for the calculations is 2015.

For the Proposed Project and Alternative 1, 30,000 sf of industrial development was selected to represent the hangars for the purposes of this analysis. Additionally, aircraft terminals are not a default land use included in the CalEEMod model. Therefore, for purposes of this analysis, the 100,000 sf terminal was represented by 16,000 sf of light industrial space and 84,000 sf of government office space. For the relocated ARFF, a building size of 13,400 sf was used, and a public facility was selected. Beginning in approximately 2022, additional trips could occur on the north side following construction of seven hangars. CalEEMod was used to estimate air pollutant emissions related to operation of these hangars. Because aircraft storage hangars are not a default land use included in the CalEEMod model, a user-input value of 10 vehicle trips per day associated with the entire hangar development was used based on

information provided in the *Monterey Regional Airport Environmental Impact Report Traffic Analysis* (**Appendix M**).

AEDT

Aircraft operational air pollutant emissions associated with the cumulative growth forecast approved by FAA for planning purposes and related indirect vehicle air pollutant emissions are also included in this appendix. The standard methodology for analyzing air emissions conditions at airports involves the use of a computer simulation model. FAA has approved the AEDT for calculating aircraft operational emissions for environmental documentation.

AEDT air pollutant and GHG emissions outputs are based on the inputs described in **Appendix K**. Emissions estimates for the 2015, 2025, and 2035 are included in this appendix.

July 2018

CONTENTS

1 Introduction 1
1.1 Project Location 1
1.2 Project Description 1
1.2.1 Proposed Project 1
1.2.2 Comparison of Project Alternatives 6
2 Methodology 7
2.1 Literature Review and Field Surveys 7
2.2 Short-Term Project Study Areas 8
2.3 Special-Status Biological Resources Investigated for Potential Occurrence 8
3 Survey Results 25
3.1 Topography and Soils 25
3.2 Vegetative Communities 25
3.2.1 Ruderal 25
3.2.2 Pinus Radiata Forest (Monterey Pine Forest) 25
3.2.3 Arctostaphylos Pumila Shrubland (Sandmat Manzanita Chaparral) 26
3.2.4 Quercus Agrifolia Woodland Alliance (Coast live oak Woodland) 26
3.2.5 Baccharis Pilularis Shrubland Alliance (Coyote Brush Scrub) 26
3.2.6 Salix lasiolepis Shrubland (Arroyo Willow Thickets) 29
3.3 Special-Status Plants Observed in the Study Areas 29
3.3.1 Sandmat Manzanita (*Arctostaphylos pumila*) 30
3.3.2 Monterey Spineflower (*Chorizanthe pungens*) 30
3.3.3 Eastwood's Goldenbush (*Ericameria fasciculata*) 30
3.3.4 Monterey Ceanothus (*Ceanothus cuneatus* var. *rigidus*) 30
3.3.5 Yadon's Piperia (*Piperia yadonii*) 33
3.3.6 Seaside Bird's Beak (*Cordylanthus rigidus* ssp. *littoralis*) 33
3.3.7 Small-Leaved Lomatium (*Lomatium parvifolium*) 33
3.3.8 Monterey Pine (*Pinus radiata*) 33
3.4 Federal and State Protected Wildlife 34
3.4.1 Migratory Birds 34
3.4.2 California Red-Legged Frog (*Rana draytonii*) 34
3.4.3 California Tiger Salamander (*Ambystoma californiense*) 35
3.4.4 California Red-Legged Frog and California Tiger Salamander Discussion 35
3.4.5 California Legless Lizards (*Anniella pulchra pulchra, A. p. nigra*) 36
3.4.6 Federal and State Regulated Habitats 36
4 Regulatory Overview 37
4.1 Federal Policies and Regulations 37
4.1.1 Federal Endangered Species Act of 1973 37
4.1.2 Migratory Bird Treaty Act of 1918 38
4.1.3 Section 404 of the Clean Water Act 38
4.2 State Policies and Regulations 38
4.2.1 California Fish and Game Code 38
4.2.2 California Endangered Species Act of 1984 39
4.2.3 Section 401 of the Clean Water Act of 1977 39
4.2.4 Senate Bill 1334 39
5 Thresholds of Significance 40

6 Short-Term Projects Impact Analysis 40
6.1 Threshold #1: Candidate, Sensitive, or Special-Status Species 40
6.1.1 Proposed Project 41
6.1.2 Alternative 1 45
6.1.3 Threshold 1 Proposed Project and Alternative 1 Compared Impacts 49
6.2 Threshold #2: Riparian Habitat or Sensitive Natural Community 49
6.2.1 Proposed Project 50
6.2.2 Alternative 1 50
6.3 Threshold #3: Wetlands 50
6.4 Threshold #4: Movement of Resident or Migratory Species 51
6.5 Threshold #5: Local Policies or Ordinances Regarding Biological Resources 51
6.5.1 Proposed Project 52
6.5.2 Alternative 1 53
6.6 Threshold #6: Conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other Conservation Plan 54
7 Short-Term Projects Mitigation 54
7.1 Threshold #1: Candidate, Sensitive, or Special-status Species 54
7.1.1 Sandmat Manzanita Proposed Project 54
7.1.2 Sandmat Manzanita Alternative 1 57
7.1.3 Monterey Pine Proposed Project and Alternative 1 57
7.1.4 Eastwood's Goldenbush Proposed Project and Alternative 1 57
7.1.5 Monterey Ceanothus Proposed Project and Alternative 1 57
7.1.6 Small-Leaved Lomatium Proposed Project and Alternative 1 58
7.1.7 Monterey Spineflower Proposed Project and Alternative 1 58
7.1.8 Yadon's Piperia Proposed Project and Alternative 1 59
7.1.9 Seaside Bird's Beak Proposed Project and Alternative 1 60
7.1.10 Nesting Birds Proposed Project and Alternative 1 60
7.1.11 California Legless Lizard Proposed Project and Alternative 1 61
7.2 Threshold #2: Riparian Habitat or Sensitive Natural Community 61
7.2.1 Proposed Project and Alternative 1 61
7.3 Threshold #3: Wetlands 64
7.4 Threshold #4: Movement of Resident or Migratory Species 64
7.5 Threshold #5: Local Policies or Ordinances Regarding Biological Resources 65
7.5.1 Proposed Project and Alternative 1 65
7.5.2 Proposed Project 65
7.5.3 Alternative 1 65
7.6 Threshold #6: Conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other Conservation Plan 65
7.6.1 Proposed Project and Alternative 1 65
8 Master Plan Programmatic Impact Analysis 66
8.1 Threshold #1: Candidate, Sensitive, or Special-status Species 66
8.1.1 California Red-Legged Frog and California Tiger Salamander 67
8.2 Threshold #2: Riparian Habitat or Sensitive Natural Community 68
8.3 Threshold #3: Wetlands 68
8.4 Threshold #4: Movement of Resident or Migratory Species 68
8.5 Threshold #5: Local Policies or Ordinances Regarding Biological Resources 68

8.6 Threshold #6: Conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other Conservation Plan 69

9 Master Plan Programmatic Mitigation 69

9.1 Threshold #1: Candidate, Sensitive, or Special-status Species 69

9.2 Threshold #2: Riparian Habitat or Sensitive Natural Community 71

9.3 Threshold #3: Wetlands 73

9.4 Threshold #4: Movement of Resident or Migratory Species 73

9.5 Threshold #5: Local Policies or Ordinances Regarding Biological Resources 73

9.6 Threshold #6: Conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other Conservation Plan 74

1 INTRODUCTION

SWCA Environmental Consultants (SWCA) prepared this Biological Resources Survey Report (BRSR) at the request of Coffman Associates (Coffman). The intent of this BRSR is to provide a project-specific biological evaluation of the Monterey Peninsula Airport District's (Airport, Project Sponsor) short-term projects that are proposed by the master plan update (master plan) and a programmatic evaluation of the Airport's proposed master plan long-term projects. SWCA prepared this BRSR to facilitate the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) evaluations of the master plan and associated short-term projects. As such, this BRSR addresses potential impacts to biological resources that are considered sensitive under the California Fish and Game Code (CFGC), Native Plant Protection Act (NPPA), federal Endangered Species Act (FESA), and California Endangered Species Act (CESA), as well as local policies and ordinances. Where potential impacts have been identified, mitigation recommendations are included to avoid or minimize the impacts. This report includes the results of an in-depth literature review and surveys of the project study areas.

1.1 Project Location

The master plan and associated projects are located at the Monterey Regional Airport (airport) in Monterey, California (Figures 1 and 2). The airport is a commercial service aviation facility located immediately south of Fremont Street and between Highways 68 and 218.

1.2 Project Description

1.2.1 Proposed Project

The projects that are evaluated within the BRSR include the projects recommended in the Airport Master Plan's (AMP) capital improvement program, as well as the AMP's overall on-airport land use plan (which could include non-aviation development and redevelopment on the airport property). Proposed short-term development projects (occurring within 10 years) are evaluated within the project's Environmental Impact Report (EIR) at a project-specific level, while future long-term development projects (occurring within 20 years) are evaluated to the level of detail feasible based on available project information (i.e., at a programmatic level). Proposed long-term development projects would likely develop in phases over a long period of time, and future environmental analysis could be required prior to their approval and construction.

One primary aspect of the proposed AMP is a multi-component airport safety enhancement project. This project is known as the Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations. Due to the need for federal funding and approval, a federal Environmental Assessment (EA) is also being prepared consistent with the requirements of NEPA. The Federal Aviation Administrative (FAA) is the lead agency for the EA.

Figure 1. Project vicinity map.

Figure 2. Project location map.

This page intentionally left blank.

The proposed Airport Safety Enhancement Project includes the following and would be phased over approximately 10 years (Table 1):

- Relocate 44 general aviation (GA) hangars and a fuel tank from the southeast side of the airport to the north side of the airport
- Add up to 7 new GA hangars on the north side of the airport
- Relocate the existing aircraft rescue and firefighting (ARFF) building and construct an ARFF service road
- Relocate the commercial terminal and necessary apron pavement (and associated parking and roadway improvements)
- Close Taxiway "K" at its connection with the new commercial terminal apron
- Implement a 52.5-foot southerly shift of 1,850 linear feet of Taxiway "A" and associated lighting, signage, and markings
- Remark hold lines on Taxiway "A" at Taxiway Connectors "G" and "J" to a 250-foot separation from the Runway 10L-28R centerline
- Install taxiway "islands" at Taxiway Connectors "G" and "J"
- Construct replacement vehicular parking along Fred Kane Drive

Other proposed short-term AMP projects include:

- Acquire a 5.5-acre private parcel near the proposed commercial terminal complex
- Construct a Highway 68 frontage road

Proposed long-term AMP projects include:

- Construct 106 new GA hangars on the north side of the airport
- Redevelop the existing GA (small aircraft) hangar area (no increase in use intensity)
- Redevelop the existing airport industrial area (no increase in use intensity)
- Construct non-aviation uses on the north side of the airport (north of Airport Road)
- Construct non-aviation uses on the south side of the airport (north of Highway 68)
- Upgrade the perimeter fence
- Construct a consolidated maintenance building
- Acquire runway protection zone (RPZ) land (20 acres)
- Acquire RPZ avigation easement (14 acres)
- Extend Taxiway "B" to the Runway 28L threshold and construct geometry improvements for Taxiways "K" and "L"

One additional AMP project is construction of a new "north side" road, which would extend from Del Rey Gardens Drive in Del Rey Oaks (off Highway 218) to the northeast side of the airport. Access to the north side of the airport is currently provided via Airport Road, which runs through the Casanova Oak Knoll (CONA) neighborhood, located northwest of the airport. The new "north side" road would provide additional access to the north side of the airport and would allow access through the CONA neighborhood for areas east of Gate 22 to be discontinued.

1.2.2 Comparison of Project Alternatives

There are two alternatives being considered in detail—the Proposed Project and Alternative 1. The major difference between the two projects is the location of the permanent ARFF building and the timing of the construction of the "north side" road. Under the Proposed Project, the existing ARFF building would be permanently relocated on the south side of the airport in the general location of the existing commercial terminal building. Since there would be up to a 6- or 7-year gap between when the existing ARFF building would be demolished and the permanent ARFF building would be constructed, a temporary ARFF building would be necessary. This temporary ARFF building would be installed on the north side GA apron. An on-airport ARFF service road would be constructed to maintain acceptable on-airport emergency response times. However, for off-airport calls, the ARFF emergency vehicles would use existing Airport Road west through the CONA neighborhood since the new "north side" road would not yet be constructed. This would create longer off-airport emergency response times than currently occur.

Under Alternative 1, the existing ARFF building would be permanently relocated to the north GA apron at the same time as the southeast GA hangars and fuel tank are relocated to the north side. The new "north side" road would be constructed, as well as an on-airport ARFF service road, to provide acceptable on- and off-airport emergency response times. Maps of the two alternatives are included in Appendix A. Table 1 compares the phasing of the Safety Enhancement Project between the two alternatives.

Table 1. Comparison of Phasing for the Safety Enhancement Project between the Two Alternatives

Construction Phases	Proposed Project	Alternative 1
Phase 1	Years 1–3: Construct the necessary pavement and infrastructure to relocate approximately 44 GA tenants from the southeast part of the airport to north of the airfield. Install a temporary ARFF facility on the Navy Flying Club apron.	Years 1–3: Construct the necessary pavement and infrastructure to relocate approximately 44 GA tenants from the southeast part of the airport to north of the airfield. Concurrent with site preparation for the north side GA area, construct a 24-foot-wide "north side" road that would go from the north GA area to Highway 218 via a connection with Del Rey Garden Drive. Construct a permanent ARFF building in the general location of the existing Navy Flying Club buildings.
Phase 2	Years 4–8: Demolish the existing ARFF building and demolish or relocate the southeast GA facilities. Construct a new commercial terminal complex (including apron, terminal loop road and roundabout, and vehicular parking lots and garage). Close Taxiway "K" between Runway 10R-28L and Taxiway "A."	Years 4–7: Demolish the existing ARFF building and demolish or relocate southeast GA facilities. Construct a new commercial terminal complex (including apron, terminal loop road and roundabout, and vehicular parking lots). Close Taxiway "K" between Runway 10R-28L and Taxiway "A."
Phase 3	Year 9: Demolish the existing terminal building. Construct a new ARFF building.	Year 8: Re-mark 1,850-linear-foot portion of Taxiway "A" to 327.5 feet from Runway 10R-28L and relocate taxiway signage and lighting. Re-mark hold lines on Taxiways "G" and "J" at 250 feet from the Runway 10R-28L centerline. Provide apron islands at Taxiways "G" and "J." Demolish the existing terminal building.
Phase 4	Year 10: Re-mark 1,850-linear-foot portion of Taxiway "A" to 327.5 feet from Runway 10R-28L and relocate taxiway signage and lighting. Re-mark hold lines on Taxiways "G" and "J" at 250 feet from the Runway 10R-28L centerline. Provide apron islands at Taxiways "G" and "J." Realign Fred Kane Drive and construct a second parking structure and surface parking lots, as needed.	Year 9: Construct replacement surface parking along Fred Kane Drive.

In addition to the new permanent ARFF building, the Proposed Project and Alternative 1 have differences in the type and amount of vehicular parking proposed for south of the new commercial terminal and along Fred Kane Drive. Under the Proposed Project, a net increase of 669 vehicular parking spaces for the commercial terminal complex in two parking garages and three surface lots is planned. Under Alternative 1, initially, a net increase of 321 vehicular parking spaces for the commercial terminal complex in three surface lots is proposed.

Finally, depending on the alternative, a proposed Highway 68 frontage road would also be changed. Under the Proposed Project, the frontage road is planned as a full loop, while under Alternative 1 it is planned as a cul-de-sac to avoid some of the rare plants located in the area. The proposed acquisition of a 5.5-acre parcel near the proposed commercial terminal complex would occur under either alternative as would all future long-term projects.

2 METHODOLOGY

2.1 Literature Review and Field Surveys

Prior to conducting a site visit, SWCA performed a literature review to gain familiarity with the project area and identify target species. The review consisted of a search of the California Natural Diversity Data Base (CNDDB) RareFind 5 (CNDDB 2018), administered by the California Department of Fish and Wildlife (CDFW), that focused on the Seaside (California) U.S. Geological Survey (USGS) quadrangle map and the surrounding quadrangles (i.e., Monterey, Marina, Salinas, Spreckels, Soberanes Point, Mt. Carmel, and Carmel Valley). Additionally, a Trust Resources Report was obtained from the U.S. Fish and Wildlife Service (USFWS) Information for Planning and Consultation (IPaC) database (USFWS 2018). These database queries are included as Appendix B. SWCA also reviewed several environmental documents prepared for other projects on the airport property.

SWCA biologists Travis Belt, Kristin Outten, Lauren Brown, Chad Jackson, and/or Chennie Castañon conducted botanical and wildlife surveys in the project areas on the following dates: April 18–19 and 25–26, May 19–20, July 14, August 4 and 24, and October 13, 2016; March 29–31, April 27–28, May 22–23, August 10–11, and September 27, 2017; and February 12, 2018. The biological surveys were conducted during the appropriate blooming period for all special-status plant species that have potential to occur on the airport property. To verify the blooming status of Monterey spineflower (*Chorizanthe pungens* var. *pungens*), Yadon's piperia (*Piperia yadonii*), and seaside bird's beak (*Cordylanthus rigidus* ssp. *littoralis*) in the vicinity of the study areas, the surveyors visited known populations of these species prior to each survey event. The seaside bird's beak reference population was visible and identifiable during every survey event; the Monterey spineflower reference population was visible and identifiable during the April, May, and July surveys; and the Yadon's piperia was visible and identifiable during the April and May surveys. SWCA also visited a known population of sand gilia (*Gilia tenuiflora* ssp. *arenaria*) on June 8, 2016. The sand gilia at the reference site was desiccated and had completed its flowering cycle in early June. This indicated that sand gilia in the Monterey area was likely identifiable during the April and May surveys.

The surveyors mapped biological resources with a Trimble® GeoXT Global Positioning System (GPS) Unit capable of sub-meter accuracy. In addition to the surveys conducted for this BRSR, SWCA has conducted numerous other biological surveys on the airport property since February 2009. The knowledge and data obtained in the previous survey efforts have been applied in this report. When necessary, the surveyors referred to *The Jepson Manual: Vascular Plants of California* (Baldwin et al. 2012) and *The Plants of Monterey County* (Matthews and Mitchell 2015) to identify plant species. Classification and mapping of the vegetative communities in the Biological Study Area (BSA) was conducted in accordance

with *A Manual of California Vegetation* (Sawyer et al. 2009). A complete list of species observed within the project study areas is included in Appendix C. Photos of the project study areas are included in Appendix D. An inventory of trees present in the study areas is included as Appendix E.

2.2 Short-Term Project Study Areas

The short-term projects include two alternatives with several related actions that would occur on different parts of the airport property. This BRSR and associated analysis segregates the various short-term projects into project study areas. The segregation provides a framework for discussing and analyzing the resources that occur within the footprint of each project element. Table 2 below lists the study areas and the alternative(s) with which the study areas are associated; Figure 3 is a map of the study areas.

Table 2. Short-Term Project Study Areas and their Associated Alternative

Study Area	Alternative Study Areas (Acres)	
	Proposed Project	**Alternative 1**
Highway 68 Frontage Road with Loop	4.13	
North Access Road	5.92	
General Aviation Relocation Area	17.29	
Proposed Parking and Circulation	11.87	
Proposed Drainage Improvements	1.26	
Highway 68 Frontage Road with Cul-de-Sac		3.42
Alternative 1 North Access Road and GA Relocation Area		23.20
Alternative 1 Parking and Circulation		11.83
Alternative 1 Drainage Improvements		0.72
Soil Deposition Areas	25.26	25.26
Terminal Area	17.04	17.20

2.3 Special-Status Biological Resources Investigated for Potential Occurrence

Prior to conducting the surveys, SWCA performed a search of the CNDDB and obtained a list of species to consider from the USFWS IPaC (Appendix B). Table 3 provides a description of the plant species reviewed and a rationale for expecting their presence or absence in the project areas, Table 4 includes an evaluation of natural communities of concern, and Table 5 includes an evaluation of the animal species including nesting birds. Special-status species with occurrences in the study areas are listed in bold and shaded grey. Species observed during the surveys or otherwise warranting specific focus are discussed in Sections 3.3 and 3.4.

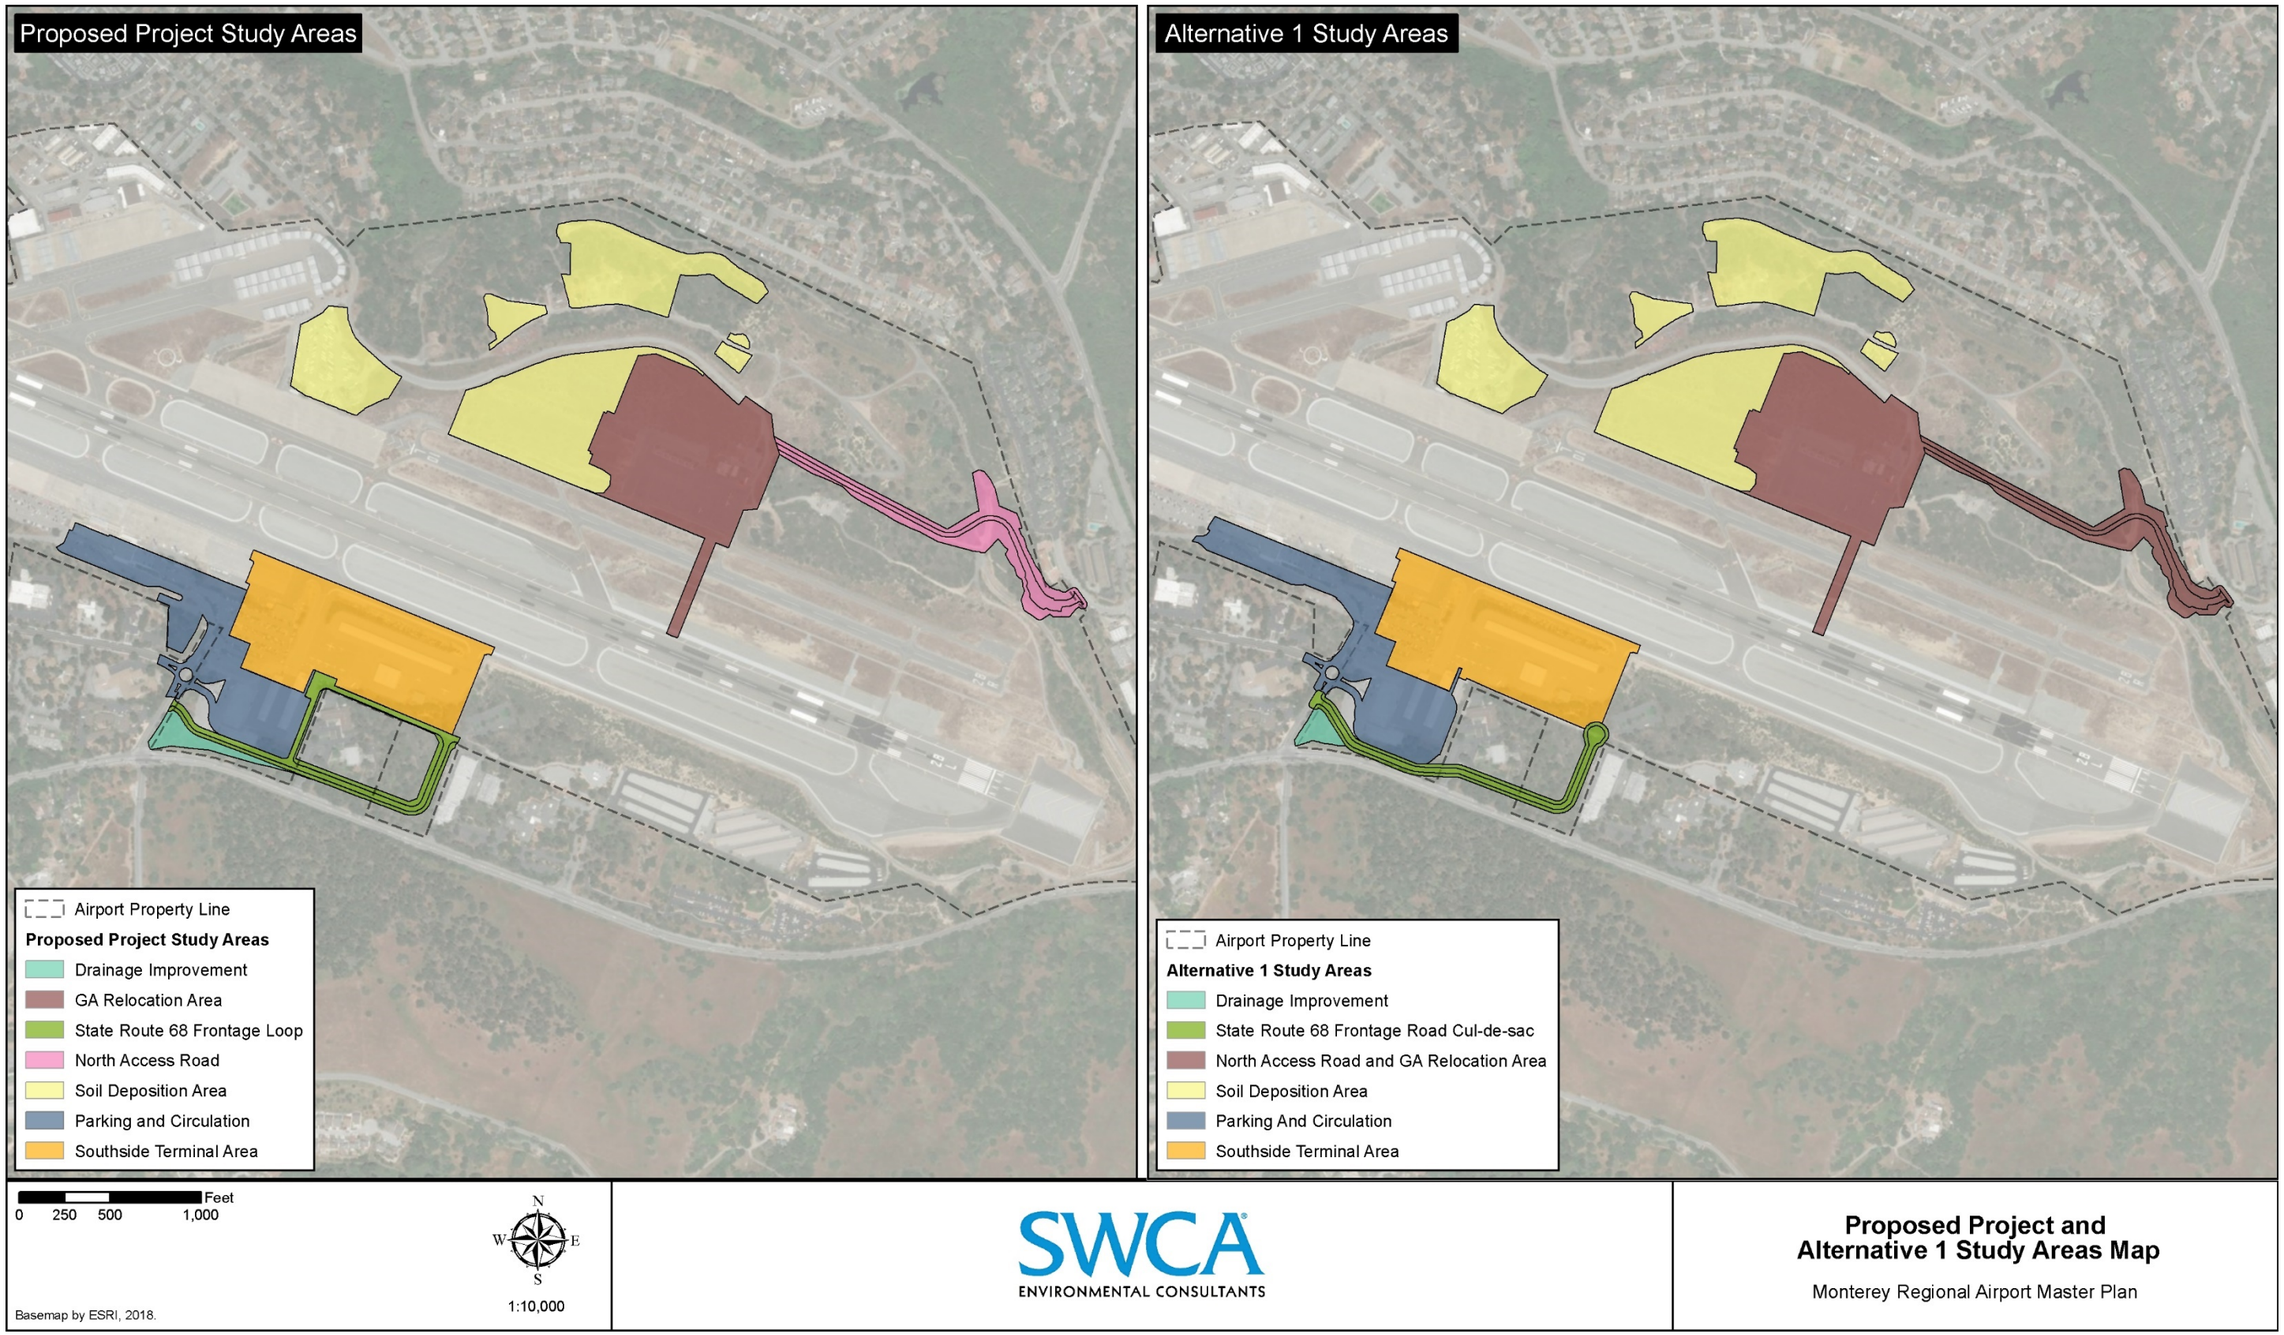

Figure 3. Proposed Project and Alternative 1 study areas map.

This page intentionally left blank.

Table 3. Special-Status Plant Species Investigated for Potential Occurrence

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
vernal pool bent grass *Agrostis lacuna-vernalis*	Annual herb; occurs in vernal pools or margins of mima mounds. Known from occurrences on Fort Ord National Monument. 115–145 meters.	April–May	--/--/1B.1	**Suitable Conditions Absent:** The airport property does not support any vernal pool or mima mound habitats. Species was not observed in the project areas during surveys conducted in the appropriate season. This species has not been documented on the airport property.
Hickman's onion *Allium hickmanii*	Usually occurs on sandy loam in grasslands, closed cone coniferous forest, chaparral, and coastal scrub. 5–200 meters.	March–May	--/--/1B.2	**Suitable Conditions Present:** Suitable soil and habitats occur in the project areas. Species not observed in the project areas during surveys conducted in the appropriate season. This species has not been documented on the airport property.
little sur manzanita *Arctostaphylos edmundsii*	Evergreen shrub; occurs on sandy soils in coastal bluff scrub and chaparral. 30–105 meters.	November–April	--/--/1B.2	**Suitable Conditions Present:** Suitable soil and habitat occur in the project areas. Species not observed in the project areas during surveys conducted in the appropriate season. This species has not been documented on the airport property.
Hooker's manzanita *Arctostaphylos hookeri* ssp. *hookeri*	Evergreen shrub; occurs on sandy soils, shaly soils, and sandstone outcrops. Associated with closed cone coniferous forest, chaparral, and coastal scrub. 85–536 meters.	January–June	--/--/1B.2	**Suitable Conditions Present:** Suitable soil and habitat occur in the project areas. Species not observed in the project areas during surveys conducted in the appropriate season. This species has not been documented on the airport property.
Toro manzanita *Arctostaphylos montereyensis*	Evergreen shrub; occurs in cismontane woodland, chaparral, and coastal scrub on sandy soils. 30–730 meters.	February–March	**--/--/1B.2**	**Suitable Conditions Present:** Suitable soil and habitat occur in the project areas. Species not observed in the project areas during surveys conducted in the appropriate season.
Pajaro manzanita *Arctostaphylos pajaroensis*	Evergreen shrub; occurs in chaparral on sandy soils. 30–760 meters.	December–March	--/--/1B.1	**Suitable Conditions Present:** Suitable soil and habitat occur in the project areas. Species not observed in the project areas during surveys conducted in the appropriate season. This species has not been documented on the airport property.
sandmat manzanita *Arctostaphylos pumila*	**Low-growing evergreen shrub; occurs in maritime chaparral and openings within Monterey pine forest. 3–205 meters.**	**February–March**	**--/--/1B.2**	**Species Present: Sandmat manzanita is present in the project areas.**

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
alkali milk-vetch *Astragalus tener* var. *tener*	Annual herb; occurs on playas, valley and foothill grassland, and vernal pools within adobe clay and alkaline soils. 1–60 meters.	March–June	--/--/1B.2	**Suitable Conditions Absent:** The project areas do not support clay soils or vernal pools. Species not observed in the project areas during surveys conducted in the appropriate season. This species has not been documented on the airport property.
coastal dunes milk-vetch *Astragalus tener* var. *titi*	Annual herb; occurs in coastal bluff scrub, coastal dunes, and coastal prairie. Often in vernally mesic areas. 1–50 meters.	March–May	FE/SE/1B.1	**Suitable Conditions Absent:** The project areas are not located on the coastal strand or adjacent bluffs. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the MRY property.
twisted horsehair lichen *Bryoria spiralifera*	Epiphytic lichen; typically associated with north coast coniferous forests located on immediate coast. Largest known population is on Samoa Peninsula in Humboldt County. 0–30 meters.	NA	--/--/1B.1	**Suitable Conditions Absent:** The project areas do not support North Coast coniferous forests and are not located on the immediate coast. Lichens were not observed on the Monterey pines located in the survey areas.
pink johnny-nip *Castilleja ambigua* ssp. *insalutata*	Annual herb; occurs in coastal prairie and coastal scrub. 0–100 meters.	May–August	--/--/1B.1	**Suitable Conditions Present:** Suitable open habitat occurs in the northern study areas. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Congdon's tarplant *Centromadia parryi* ssp. *congdonii*	Occurs in depressional areas within valley and foothill grassland known to occur in clay soils. 1–230 meters.	June–November	--/--/1B.2	**Suitable Conditions Absent:** The project areas do not contain the appropriate soils. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Monterey spineflower ***Chorizanthe pungens***	**Annual herb; occurs in chaparral, cismontane woodland, coastal dunes, coastal scrub, and valley and foothill grassland on sandy soils. 3–450 meters.**	**April–June**	**FT, CH/--/1B.2**	**Species Present: Monterey spineflower was observed in the project study areas.**
robust spineflower *Chorizanthe robusta* var. *robusta*	Annual herb; occurs in chaparral, cismontane woodland, coastal dunes, and coastal scrub with sandy or gravelly soils. 3–300 meters.	April–September	FE, CH/--/1B.1	**Suitable Conditions Present:** The project study areas support suitable sandy soil and habitats. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
Jolon clarkia *Clarkia jolonensis*	Annual herb; occurs in chaparral, cismontane woodland, coastal scrub, and riparian woodland. 20–660 meters.	April–June	--/--/1B.2	**Suitable Conditions Present:** The study areas support appropriate habitats Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
purple amole *Chlorogalum purpureum* var. *purpureum*	Bulbiferous herb; occurs in chaparral, cismontane woodland, and valley and foothill grassland on gravelly or clay soils. 205–350 meters.	April–June	FT, CH/--/1B.1	**Suitable Conditions Absent:** The project areas do not contain suitable soils and the elevation is lower than documented range for this species. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
San Francisco collinsia *Collinsia multicolor*	Annual herb; occurs in closed-cone coniferous forest and coastal scrub. Occasionally found in serpentinite. 30–250 meters.	March–May	--/--/1B.2	**Suitable Conditions Present:** The study areas support appropriate habitats Species not observed in the project areas during surveys conducted in the appropriate season. Species has been documented on airport property approximately 4,000 feet east of the project area.
seaside bird's-beak ***Cordylanthus rigidus* ssp. *littoralis***	**Annual herb; occurs in closed-cone coniferous forest, chaparral, cismontane woodland, coastal dunes, and coastal scrub with sandy soils. Often found in disturbed sites. 0–425 meters.**	**April–October**	**--/SE/1B.1**	**Species Present: Seaside bird's-beak was observed in study areas.**
Hutchinson's larkspur *Delphinium hutchinsoniae*	Perennial herb; occurs in broadleaf upland forest, chaparral, coastal prairie, and coastal scrub. 0–427 meters.	March–June	--/--/1B.2	**Suitable Conditions Present:** The study areas support the appropriate habitats. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
umbrella larkspur *Delphinium umbraculorum*	Perennial herb; occurs in cismontane woodland. 400–1,600 meters.	April–June	--/--/1B.3	**Suitable Conditions Absent:** The elevation of the project study areas is lower than documented range for this species. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Eastwood's goldenbush ***Ericameria fasciculata***	**Perennial shrub; occurs in closed-cone coniferous forest, chaparral, coastal dunes, and coastal scrub and within openings on sandy soil. 30–275 meters.**	**July–October**	**--/--/1B.1**	**Species Present: Eastwood's goldenbush was observed in the project study areas.**

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
Pinnacles buckwheat *Eriogonum nortonii*	Annual herb; occurs in chaparral and valley and foothill grassland with sandy soils, often colonizing recently burned areas. 300–975 meters.	May–August	--/--/1B.3	**Suitable Conditions Absent:** The project areas support the appropriate soils but the elevation is lower than documented range for this species. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
sand-loving wallflower *Erysimum ammophilum*	Perennial herb; occurs in chaparral, coastal dunes, and coastal scrub with sandy soils and openings. 0–60 meters.	February–June	--/--/1B.2	**Suitable Conditions Present:** The project areas support suitable soil and habitat conditions for this species. Species was not observed in the project areas during surveys conducted in the appropriate season. Species has been documented on the northern portion of the AMP study area (ESA 2004).
Menzies' wallflower *Erysimum menziesii* ssp. *menziesii*	Perennial herb; occurs in coastal dunes. 0–35 meters.	March–June	FE/SE/1B.1	**Marginal Conditions Present:** The project study areas support suitable sandy soil does not support coastal dunes. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been observed on the airport property.
fragrant fritillary *Fritillaria liliacea*	Bulbiferous herb; occurs in cismontane woodland, coastal prairies, coastal scrub, and valley and foothill grassland; often associated with serpentinite. 3–410 meters.	February–April	--/--/1B.2	**Suitable Conditions Absent:** The project study areas do not support the appropriate soils. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
sand gilia *Gilia tenuiflora* ssp. *arenaria*	Annual herb; occurs in chaparral, cismontane woodland, coastal dunes, and coastal scrub in sandy soil with openings. 0–45 meters.	April–June	FE/ST/1B.2	**Suitable Conditions Present:** The project study areas support suitable sandy soil and open habitat conditions for this species. Species not observed in the project areas during surveys conducted in the appropriate season. Surveys conducted by in 2005 by Denise Duffy and Associates indicate that approximately 15 sand gilia individuals were observed near the North Access Road study area. However, the Denise Duffy report does not map or describe the locations of occurrences.
Gowen cypress *Hesperocyparis goveniana*	Evergreen tree; occurs in closed-cone coniferous forest and maritime chaparral. Typically associated with sandy soil. Known from only three native occurrences in the Monterey area, including the Del Monte Forest/Huckleberry Hill, Point Lobos, and Pacific Grove. 30–300 meters	NA	FT/--/1B.2	**Suitable Conditions Absent:** The airport is not located within any of the three known stands of this species. Species not observed in the project areas. Species has not been documented on the airport property.

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
Monterey cypress *Hesperocyparis macrocarpa*	Evergreen tree; occurs in closed-cone coniferous forest. Known from only two native occurrences in the Monterey area. 10–30 meters	NA	--/--/1B.2	**Suitable Conditions Absent:** The airport is not located within any of the two known stands of this species. Natural occurrences of this species are absent; however, numerous planted species occur in the study areas.
Kellogg's horkelia *Horkelia cuneata* ssp. *sericea*	Perennial herb; occurs in closed-cone coniferous forest, maritime chaparral, and coastal scrub with sandy or gravelly openings. 10–200 meters.	April–September	--/--/1B.1	**Suitable Conditions Present:** The study areas support suitable sandy soil and open habitat conditions for this species. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Point Reyes horkelia *Horkelia marinensis*	Perennial herb from the Rosaceae family that occurs in coastal dunes, prairie, and scrub habitats. 5–755 meters.	May–September	--/--/1B.2	**Suitable Conditions Absent:** The project study areas do not support coastal dune habitat. Species was not observed in the project areas during surveys conducted in the appropriate season. Species has not been observed on the airport property.
Contra Costa goldfields *Lasthenia conjugens*	Annual herb; occurs in mesic sites with cismontane woodland, playas, valley and foothill grassland, or vernal pools. 0–470 meters.	March–June	FE, CH/--/1B.1	**Suitable Conditions Absent:** The study areas include a stormwater runoff collection area that provides marginal conditions for this species, but ongoing disturbances likely preclude this species from occurring. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
beach layia *Layia carnosa*	Annual herb; occurs in coastal dunes and coastal scrub on sandy soils. 0–60 meters.	March–July	FE/SE/1B.1	**Marginal Conditions Present:** The project study areas support suitable sandy soil and open habitat but are not located in the coastal dunes. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
legenere *Legenere limosa*	Annual herb; occurs in vernal pools. 1–880 meters.	April–June	--/--/1B.1	**Suitable Conditions Absent:** The project areas do not support vernal pools. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
Tidestrom's lupine *Lupinus tidestromii*	Rhizomatous herb; occurs on coastal dunes. 0–100 meters.	April–June	FE/SE/1B.1	**Suitable Conditions Absent:** The study areas support suitable sandy soil and open habitat conditions but are not located at the immediate coast. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Carmel Valley bush-mallow *Malacothamnus palmeri* var. *involucratus*	Perennial shrub; occurs in chaparral, cismontane woodland, and coastal scrub. 30–1,100 meters.	May–August	--/--/1B.2	**Suitable Conditions Present:** The study areas support suitable habitat conditions. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Santa Lucia bush-mallow *Malacothamnus palmeri* var. *palmeri*	Deciduous shrub; occurs in chaparral with rocky substrates. 60–360 meters.	May–July	--/--/1B.2	**Suitable Conditions Absent:** The study areas are located at a lower elevation than the species' documented range and do not support rocky soils. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Carmel Valley malacothrix *Malacothrix saxatilis* var. *arachnoidea*	Rhizomatous herb; occurs in chaparral and coastal scrub with rocky substrates. 25–1036 meters.	June–December	--/--/1B.2	**Suitable Conditions Absent:** The study areas do not support rocky soils. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
white fairypoppy *Meconella oregana*	Annual herb; occurs in coastal prairie and coastal scrub habitats; only known from five occurrences in California. 250–620 meters.	March–April	--/--/1B.1	**Suitable Conditions Absent:** The study areas are located at a lower elevation than the species' documented range. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
marsh microseris *Microseris paludosa*	Perennial herb; occurs in closed-cone coniferous forest, cismontane woodland, coastal scrub, and valley and foothill grassland. 5–300 meters	April–June	--/--/1B.2	**Marginal Conditions Present:** Appropriate habitat occurs in the study areas but the lack of vernally mesic areas is not **c**onducive to this species. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
northern curly-leaved monardella *Monardella sinuata* ssp. *nigrescens*	Annual herb; occurs in sandy soil among chaparral, lower montane coniferous forest, coastal dunes, and coastal scrub with openings. 0–300 meters	April–September	--/--/1B.2	**Suitable Conditions Present:** Species occurs on the airport property approximately 700 feet east of the study area. CNDDB documents occurrences along Highway 68, south of the airport fence, east of Olmstead Road, and west of Canyon Del Rey. This roughly corresponds with the study area. Species was not observed in the project areas during surveys conducted in the appropriate season.
San Joaquin wooly-threads *Monolopia (Lembertia) congdonii*	Annual herb; occurs in chenopod scrub and valley and foothill grassland on sandy soils. 60–800 meters.	February–May	FE/--/1B.2	**Suitable Conditions Absent:** The study areas do not support appropriate soil types and are at a lower elevation than this species' range. Species was not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
woodland woollythreads *Monolopia gracilens*	Annual herb; associated with serpentine soil. Often found in openings within broadleafed upland forest, chaparral, cismontane woodland, north coast coniferous forest, and valley and foothill grassland. 100–1200 meters	February – July	--/--/1B.2	**Suitable Conditions Absent:** The study areas do not support appropriate soil types and are at a lower elevation than this species' range. Species was not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Monterey pine ***Pinus radiata***	**Evergreen tree; only native stands restricted to Año Nuevo, Cambria, and the Monterey Peninsula. Occurs in closed-cone coniferous forest and cismontane woodland. 25–185 meters.**	**n/a**	**--/--/1B.1**	**Species Present: Monterey pines are present in the study areas.**
Yadon's piperia ***Piperia yadonii***	**Perennial herb; occurs in coastal bluff scrub, closed-cone coniferous forest, and maritime chaparral with sandy soil. 10–510 meters.**	**May–August**	**FE, CH/--/1B.1**	**Species Present: Yadon's piperia is present in the study areas.**
Choris' popcorn-flower *Plagiobothrys chorisianus* var. *chorisianus*	Annual herb; occurs in vernal pools and other wet areas among chaparral, coastal prairie, and coastal scrub habitats. 15–160 meters	March–June	--/--/1B.2	**Suitable Conditions Absent:** Vernal pools are not present in the study areas. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
hooked popcorn-flower *Plagiobothrys uncinatus*	Annual herb; occurs in chaparral, cismontane woodland, and valley and foothill grassland with sandy soils. 300–760 meters.	April–May	--/--/1B.1	**Suitable Conditions Absent:** The study areas are located at a lower elevation than the species' range and do not support the appropriate communities. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
Hickman's cinquefoil *Potentilla hickmanii*	Perennial herb; occurs in wet areas associated with coastal bluff scrub, closed-cone coniferous forest, meadows and seeps, and freshwater marshes. 10–149 meters.	April–August	FE/SE/1B.1	**Marginal Conditions Present:** The southern BSA includes a stormwater collection area that provides marginal habitat for this species. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
angel's hair lichen *Ramalina thrausta*	Epiphytic lichen; grows on dead twigs and other lichens in north coast coniferous forests. 75–430 meters	n/a	--/--/2B.1	**Suitable Conditions Absent:** The study areas do not support north coast coniferous forests. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
pine rose *Rosa pinetorum*	Perennial shrub; occurs in closed-cone coniferous forest. 2–300 meters.	May–July	--/--/1B.2	**Suitable Conditions Present:** The study areas support Monterey pine forest. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
maple-leaved checkerbloom *Sidalcea malachroides*	Perennial herb; occurs in broad-leafed upland forest, coastal prairies, coastal scrub, north coast coniferous forest, and riparian woodland. Often found in disturbed areas. 2–730 meters.	April–August	--/--/4.2	**Suitable Conditions Present:** The study areas support coastal scrub and grassland habitats. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Santa Cruz microseris *Stebbinsoseris decipiens*	Annual herb; occurs in broadleaf upland forest, closed-cone coniferous forest, chaparral, coastal prairie, coastal scrub, and valley and foothill grassland. Associated with open areas; occasionally occurring in serpentinite. 10–500 meters.	April–May	--/--/1B.2	**Suitable Conditions Present:** The study areas support coastal scrub, chaparral, forested areas, and grassland habitats. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
California screw moss *Tortula californica*	Moss; occurs in chenopod scrub and valley and foothill grassland associated with sandy soil. 10–1,460 meters.	n/a	--/--/1B.2	**Suitable Conditions Absent:** The BSA does not support the appropriate habitats. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Santa Cruz clover *Trifolium buckwestiorum*	Annual herb; occurs in broadleaf upland forest, cismontane woodland and coastal prairies with gravelly margins. 105–610 meters.	April–October	--/--/1B.1	**Suitable Conditions Absent:** The study areas do not support the appropriate habitat or soils. The study areas are at lower elevation than this species known range. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.

Species Name	Habitat and Distribution	Flower Season	Legal Status Federal/State/ CNPS	Rationale for Expecting Presence or Absence
saline clover *Trifolium hydrophilum*	Annual herb; occurs in marshes and swamps, valley and foothill grassland (mesic, alkaline), and vernal pools. 0–300 meters.	April–June	--/--/1B.2	**Suitable Conditions Absent:** The study areas do not support the appropriate wetland habitats. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Pacific Grove clover *Trifolium polyodon*	Annual herb; usually associated with mesic sites in closed-cone coniferous forest, coastal prairies, meadows and seeps, and valley and foothill grassland. 5–120 meters.	April–June	--/SR/1B.1	**Marginal Conditions Present:** The study area includes a stormwater collection area that provides marginal habitat for this species. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.
Monterey clover *Trifolium trichocalyx*	Annual herb; occurs in closed-cone coniferous forest with sandy openings or burned areas. 30–240 meters.	April–June	FE/SE/1B.1	**Suitable Conditions Present:** The study area supports the appropriate habitats. Species not observed in the project areas during surveys conducted in the appropriate season. Species has not been documented on the airport property.

Status Codes

--= No status

Federal: FE = Federal Endangered; FT = Federal Threatened; CH = Federal Critical Habitat

State: SE = State Endangered; ST= State Threatened; SR= State Rare

California Native Plant Society (CNPS): Rank 1B = rare, threatened, or endangered in California and elsewhere; Rank 2 = rare, threatened, or endangered in California, but more common elsewhere; Rank 3 = plants that about which more information is needed; Rank 4 = a watch list plants of limited distribution.
Threat Code: _.1 = Seriously endangered in California (over 80% of occurrences threatened; _.2 = Fairly endangered in California (20-80% occurrences threatened); _.3 = Not very endangered in California (<20% of occurrences threatened)

Rationale Terms: **Species Present:** Species was or has been observed in the survey area. **Suitable Conditions Present:** The appropriate habitat, soils, and elevation are present in the survey area. **Marginal Conditions Present:** The appropriate habitat and/or soils are present but other factors (past disturbances, elevation range) may preclude species occurrence. **Suitable Conditions Absent:** The survey area did not support the appropriate habitat, soils, and/or elevation for the species.

Table 4. Natural Communities of Concern Investigated for Occurrence

Natural Community	Description	Rationale for Expecting Presence or Absence
central dune scrub	A back-dune plant community characterized by low-growing, drought tolerant shrubs that develop considerable cover. Diagnostic species include *Ericameria ericoides* and *Lupinus chamissonis*.	The project study areas are not located on the coast and do not support dune scrub habitats.
central foredunes	A foredune plant community characterized by scattered low-growing perennial plants including *Abronia* sp., *Ambrosia* sp., and *Cackile* sp. Usually occurring in areas exposed to tidal action.	The project study areas are not located on the coast and do not support any foredune habitats.
central maritime chaparral	**A variable scrub community of moderate to high cover dominated by various *Arctostaphylos* sp. Found on well-drained sandy soils in areas subject to summer fog.**	**Central maritime chaparral is present in the project study areas.**
coastal and valley freshwater marsh	A wetland community that is found in areas of permanently or prolonged freshwater saturation without significant current or flow. Vegetation is dominated by perennial emergent monocots including cattails and rushes.	The project study areas do not support coastal and valley freshwater marsh.
Monterey cypress forest	A moderately dense forest dominated by *Callitropsis macrocarpa*; understory usually consists of scattered shrubs and perennial herbs. This community is confined to rocky granitic soils of coastal bluffs.	The project study areas do not support Monterey cypress forest.
Monterey pine forest	**Open to dense forest dominated by *Pinus radiata* with a significant presence of coast live oak. The understory is variable in density and composition. Monterey pine forests are limited to areas with well-drained sandy soils and marine fog.**	**Monterey Pine forest is present in the project study areas.**
northern bishop pine forest	Open to dense serotinous forest dominated by *Pinus muricata.* This community often intergrades with northern coastal scrub on rocky soils, upland redwood forest on protected sites, or pygmy cypress forest on coastal terraces with podzol soils. .	The project study areas do not support northern bishop pine forest.
northern coastal salt marsh	Marsh habitat supporting herbaceous, suffrutescent, salt-tolerant hydrophytes often active in summer and dormant in winter. Characteristic species include *Jaumea carnosa*, *Limonium californicum*, and *Frankenia salina.* Developed around Humboldt Bay, Tomales Bay, San Francisco Bay, Elkhorn Slough, and Morro Bay.	The project study areas do not support northern coastal salt marsh.
valley needlegrass grassland	Grassland reaching up to 2 feet tall and dominated by *Nassella* sp., which is a native tussock-forming grass. Annual grasses occur between the perennials, often exceeding the bunch grasses in cover. Usually occurs on fine-textured soils that are wet in the winter and very dry in the summer.	The project study areas do not support valley needlegrass grassland.

Table 5. Special-Status Animal Species Investigated for Potential Occurrence

Species Name	Habitat and Distribution	Legal Status Federal/State/ CDFW	Rationale for Expecting Presence or Absence
Invertebrates			
vernal pool fairy shrimp *Branchinecta lynchi*	Occur in vernal pool habitats including depressions in sandstone to small swale, earth slump, or basalt-flow depressions with a grassy or, occasionally, muddy bottom in grassland.	FT, CH/--/--	**Habitat Absent:** The project areas do not support suitable vernal pool habitat. Species is not expected to occur in the project areas.
California linderiella *Linderiella occidentalis*	Occur in seasonal ponds in grasslands, sandstone depressions, and alluvial flats with hardpan beneath.	--/--/SA	**Habitat Absent:** The project areas do not support suitable sandstone depressions. Species is not expected to occur in the project areas.
globose dune beetle *Coelus globosus*	Inhabitant of coastal sand dune habitat. Inhabits foredunes and sand hummocks, burrowing beneath the sand surface. Most common beneath dune vegetation.	--/--/SA	**Habitat Absent:** The project areas do not include coastal sand dunes. Species not expected to occur.
monarch butterfly *Danaus plexippus*	Species occurs along the coast from northern Mendocino to Baja California, Mexico. Winter roosts in wind-protected tree groves (e.g., eucalyptus, Monterey pine, and cypress) where nectar and water sources are abundant.	--/--/SA	**Habitat Present:** Suitable winter roost habitat occurs in the Monterey pines located in the study area.
Smith's blue butterfly *Euphilotes enoptes smithi*	Occurs in coastal dunes and coastal sage scrub plant communities in Monterey and Santa Cruz counties. Utilizes *Eriogonum latifolium* and *Eriogonum parvifolium* as a host plant for larval and food.	FE, PCH/--/--	**Habitat Absent**: The necessary host plants were not observed in the BSA.
Fish			
tidewater goby *Eucyclogobius newberryi*	Occurs in brackish shallow lagoons and lower stream reaches where water is fairly still, but not stagnant.	FE, CH/--/SSC	**Habitat Absent**: The project areas do not support suitable aquatic habitat.
steelhead – south/central California coast DPS *Oncorhynchus mykiss irideus*	Occurs in clear, cool water with abundant in-stream cover, well-vegetated stream margins, relatively stable water flow, and a 1:1 pool-to-riffle ratio.	FT, CH/--/SSC	**Habitat Absent**: The project areas do not support suitable aquatic habitat.
Amphibians			
California tiger salamander *Ambystoma californiense*	Occurs in vernal pools within grassland or oak woodlands; require seasonal water, ground squirrel burrows, or other underground refuges.	FT, CH/ST/--	**Habitat Absent**: The project areas do not support suitable aquatic breeding habitat and are separated from other breeding areas by development and roads. Species is not expected to occur in the project areas.
California red-legged frog *Rana draytonii*	Occurs in aquatic habitats with little or no flow and surface water depths to at least 2.3 feet. Presence of fairly sturdy underwater supports such as cattails.	FT, CH /--/SSC	**Habitat Present:** The northern detention pond in the AMP project study area could support this species.

Species Name	Habitat and Distribution	Legal Status Federal/State/ CDFW	Rationale for Expecting Presence or Absence
Coast range newt *Taricha torosa torosa*	Breed in ponds, reservoirs, and slow-moving streams. Frequents terrestrial habitats such as oak woodlands.	--/--/CSC	**Habitat Absent**: The project areas do not support suitable aquatic habitat.
Reptiles			
southwestern pond turtle *Emys marmorata*	Occurs in quiet waters of ponds, lakes, streams, and marshes; typically in the deepest parts with an abundance of basking sites.	--/--/SSC	**Habitat Absent**: The project study areas do not support any suitable aquatic habitat. Not expected to occur in the project areas.
silvery legless lizard *Anniella pulchra pulchra*	Occurs in sandy or loose loamy soils with high moisture content under vegetation.	**--/--/**SSC	**Habitat Present**: The project areas support appropriate soils and shelter habitats for species. Recent surveys for this species have indicated that the airport property supports very few legless lizards. However, species has been found on the property. Minimization measures are recommended.
black legless lizard *Anniella pulchra nigra*	Occurs in sand dunes and sandy soils in the Monterey Bay and Morro Bay regions. Inhabits sandy soil/dune areas with bush lupine and mock heather as dominant plans. Moist soil is essential.	--/--/SSC	**Habitat Present**: The project areas support appropriate soils and shelter habitats for species. Recent surveys for this species have indicated that the airport property supports very few legless lizards. However, species has been found on the property. Minimization measures are recommended.
coast horned lizard *Phrynosoma blainvillii*	Frequents a wide variety of habitats; most commonly occurring in lowlands along sandy washes with scattered low bushes.	--/--/SSC	**Habitat Present**: The project areas support sandy soil and open habitat with suitable shelter sites. Species has not been observed on the airport property but may exist there.
two-striped garter snake *Thamnophis hammondii*	Occurs in coastal California from Salinas to Baja California and at elevations up to 7,000 feet. Found along streams with rocky beds and permanent freshwater.	--/--/SSC	**Habitat Absent**: The project areas do not support suitable aquatic habitat.
Birds			
tricolored blackbird *Agelaius tricolor*	(Nesting colony) requires open water, protected nesting substrate, and foraging area with insect prey.	--/--/SSC	**Habitat Absent**: The airport property does not support suitable nesting habitat. Species not expected to occur in any of the project areas.
burrowing owl *Athene cunicularia*	(Burrow and wintering sites) occurs in open, dry grasslands, deserts and scrublands. Subterranean nester, dependent upon burrowing mammals.	BCC/--/SSC	**Marginal Habitat Present**: The airport is not within the nesting range of species. Although unlikely, portions of the northside GA development areas may attract a wintering species.

Species Name	Habitat and Distribution	Legal Status Federal/State/ CDFW	Rationale for Expecting Presence or Absence
marbled murrelet *Brachyramphus marmoratus marmoratus*	(Nesting); spends most of the non-breeding season in offshore or nearshore environments near coniferous forests. The only California alcid species to nest inland. Typically nests in the upper branches of redwoods or Douglas-fir forests. Builds its nests with lichens and mosses.	FT, CH/SE/--	**Habitat Absent**: The project study areas do not support suitable nesting habitat. Species is not expected to occur in the project areas.
ferruginous hawk *Buteo regalis*	(Non-breeding and wintering); occurs in open grasslands, sagebrush flats, desert scrub, low foothills, and fringes of pinyon-juniper habitats. Eats mostly lagomorphs, ground squirrels, and mice.	BCC/--/WL	**Nesting Habitat Absent**: Uncommon winter visitor. CNDDB documents one occurrence northeast of Marina. If an individual were present on MRY, it would be foraging and not nesting.
western snowy plover *Charadrius alexandrinus nivosus*	(Nesting); occurs on sandy beaches, salt pond levees, and shores of large alkali lakes. Needs sandy, gravelly, or friable soils for nesting.	FT, CH/--/SSC	**Habitat Absent**: The project study areas do not contain any aquatic sites with shoreline for foraging and do not support suitable nesting habitat. Species is not expected to occur in the project areas.
black swift *Cypseloides niger*	(Nesting); occurs along the coastal belt of Santa Cruz and Monterey Counties, central and southern Sierra Nevada, and in the San Bernardino and San Jacinto Mountains. Breeds in small colonies on cliffs, near waterfalls, and on sea bluffs above the ocean.	BCC/--/SSC	**Habitat Absent**: The project study areas do not support t cliffs or bluffs that are needed for nesting habitat. This species is not expected to occur on the airport property. Species was not observed during the surveys.
Southwestern willow flycatcher *Empidonax traillii extimus*	Occurs in riparian woodlands of southern California.	FE/SE/--	**Habitat Absent**: The project areas do not support any riparian habitat.
California horned lark ***Eremophila alpestris actia***	**Occurs in short grass prairies, coastal plains, fallow grain fields, and alkali flats. Found in coastal regions from Sonoma to San Diego County, and west to the San Joaquin Valley.**	**--/--/WL**	**Species Present: The Northside GA and Maintenance Building project areas support suitable conditions for species. Species has been observed on the airfield during past survey efforts.**
prairie falcon *Falco mexicanus*	(Nesting); occurs in dry, open terrain that is either level or hilly. Nesting habitat is limited to cliffs.	BCC/--/WL	**Nesting Habitat Absent:** The project areas do not include cliffs for nesting. The airfield may provide foraging habitat for individuals that nest off the property.
ashy storm-petrel *Oceanodroma homochroa*	(Rookery site); colonial nester on offshore islands. Usually nests on driest part of islands. Forages over open ocean. Nest sites on islands are in crevices beneath loosely piled rocks or driftwood, or in caves.	--/--/SSC	**Habitat Absent**: The project areas do not support rookery habitat. Species is not expected to occur at the airport.
California brown pelican *Pelecanus occidentalis californicus*	(Nesting colony and communal roosts); nests on coastal islands in colonies.	FE/SD, FP/--	**Habitat Absent**: The project areas do not support nesting or roosting habitat. Species is not expected to occur at the airport.
California clapper rail *Rallus longirostris obsoletus*	Occurs within salt and brackish marshes dominated by pickleweed and Pacific cordgrass (*Spartina foliosa*). Currently, this species is restricted to marsh areas within the vicinity of San Francisco Bay.	FE/SE, FP/--	**Habitat Absent**: The project areas do not support suitable marsh habitat. Species is not expected to occur in the project areas.

Species Name	Habitat and Distribution	Legal Status Federal/State/ CDFW	Rationale for Expecting Presence or Absence
bank swallow *Riparia riparia*	Nests in colonies in vertical sand banks. Forages over meadows and water.	--/ST/--	**Habitat Absent**: The project areas do not support cliffs or banks for nesting habitat. Species is not expected to occur in the project areas.
least Bell's vireo *Vireo bellii pusillus*	(Nesting); summer resident of southern California. Occurs in low riparian areas in the vicinity of water or in dry river bottoms below 2,000 feet. Nests along the margins of bushes or twigs of willow, *Baccharis*, or mesquite.	FE, CH, BCC/SE/--	**Habitat Absent**: The project areas do not support suitable nesting habitat. Species is not expected to occur in the project areas.
Other nesting birds **Class Aves**	**(Nesting); various habitats.**	**MBTA/--/CDFW Section 3503**	**Habitat Present**: **The project areas include vegetation that provide avian nesting habitat. Pre-activity nesting bird surveys are recommended.**
Mammals			
Townsends big-eared bat *Corynorhinus townsendii*	Occurs in a wide variety of habitats; most common in mesic (wet) sites. May use trees for day and night roosts; however, requires caves, mines, rock faces, bridges or buildings for maternity roosts. Maternity roosts are in relatively warm sites.	--/SC/SSC	**Marginal Habitat Present:** The project study areas support trees for daytime roosts but do not support suitable maternity roost habitat or mesic areas for foraging.
southern sea otter *Enhydra lutris nereis*	Sea otters are found in nearshore marine environments of California from Año Nuevo, San Mateo County to Point Sal, Santa Barbara County.	FT, MMPA/FP/--	**Habitat Absent**: The project areas do not support any suitable marine habitat.
hoary bat *Lasiurus cinereus*	Occurs in open habitats and habitat mosaics with access to trees for cover. Roosts in dense foliage of medium to large trees.	--/--/SA	**Habitat Present:** The trees in the project study areas provide suitable roosting habitat and the open areas of the airfield provide foraging habitat. Species not observed during the surveys.
Salinas harvest mouse *Reithrodontomys megalotis distichlis*	Known only from the Monterey Bay region. Occurs in fresh and brackish water wetlands and probably in the adjacent uplands around the mouth of the Salinas River.	--/--/SA	**Habitat Absent**: The project areas do not support suitable marsh habitat. Species is not expected to occur in the project areas.
American badger *Taxidea taxus*	Occurs in open stages of shrub, forest, and herbaceous habitats; needs uncultivated ground with friable soils for burrowing.	--/--/SSC	**Habitat Absent**: The project areas do not support suitable habitat.

Status Codes

-- = No status

Federal: FE = Federal Endangered; FT = Federal Threatened; FC = Federal Candidate; CH= Federal Critical Habitat; PCH = Proposed Federal Critical Habitat; BCC = USFWS Bird of Conservation Concern; MBTA= Protected by Federal Migratory Bird Treaty Act; MMPA = Protected by Marine Mammal Protection Act

State: SE = State Endangered; ST = State Threatened; SD = State Delisted; FP = Fully Protected Species; SC = State Candidate

CDFW: SSC= California Species of Special Concern; WL = Included on CDFW Watch List; SA= Included in CDFW "Special Animals" List; CDFW Section 3503 = Protected by Section 3503 of CDFW code

Rationale Terms: **Species Present:** Species was or has been observed in the survey area. **Habitat Present:** The survey area is within the species range and supports the appropriate habitat, soils, and elevation. **Marginal Habitat Present:** The survey area is in the species range and supports the appropriate habitat and/or soils but other factors (past disturbances, presence of predators) may preclude species occurrence. **Habitat Absent:** The survey area is not within the species range and/or does not support the appropriate habitat, soils, and/or elevation for the species.

3 SURVEY RESULTS

3.1 Topography and Soils

The topography within the project study areas is relatively flat to moderately sloped with the greatest slope occurring in the southern and eastern parts of the project areas. The elevation is approximately 200 feet (60 meters). According to the Natural Resources Conservation Service (NRCS) Web Soil Survey, soils in the project areas consist of Baywood sand (2–15% slopes), Arnold loamy sand (9-15% slopes), and Oceano sand (2-15% slopes) (NRCS 2017). Baywood sand is a deep excessively drained soil, which is found on slopes and stabilized dunes formed by windblown sand. Baywood sand supports chaparral and oak woodland communities. Most of the study areas consists of Baywood sand. The steep slope located just south of the existing terminal consists of Arnold loamy sand. Arnold loamy sand is a deep, excessively drained soil found on steep slopes of foothills and mountains. It is formed from weathered sandstone and naturally supports annual grassland, brush, and woodlands. Oceano sand is a deep excessively drained soil derived from stabilized windblown sand. A small polygon of Oceano sand is mapped in the northern study areas.

3.2 Vegetative Communities

The following sections describe the plant communities that occur in the project study areas. Figure 4 includes a map of the vegetative communities on the airport.

3.2.1 Ruderal

Ruderal vegetation is usually found in disturbed areas that have been significantly altered by construction, landscaping, or other types of land-clearing activities. Ruderal habitats often occur along roadsides and fence-lines, near developments, and in other areas experiencing severe surface disturbance. Plants found within this habitat are typically introduced Mediterranean species that colonize disturbed lands. Few occurrences of hardy native species such as Monterey spineflower, sandmat manzanita (*Arctostaphylos pumila*), purple owl's clover (*Castilleja exserta*), and annual lupine (*Lupinus bicolor*) have been able to exist in the ruderal vegetation. In some areas, native plant species have started to recolonize the ruderal vegetation but do not provide sufficient cover to be considered a native plant community. These areas are mapped as "Ruderal with Remnant Native Trees/Shrubs" in Figure 4.

3.2.2 Pinus Radiata Forest (Monterey Pine Forest)

Monterey pine forest includes Monterey pine (*Pinus radiata*) trees as the dominant or co-dominant species in the tree canopy. This habitat type occurs on marine terraces and headlands with well-drained soils. The Monterey pine forest is largely in the southern project areas along the southern airport property boundary. It includes coast live oak (*Quercus agrifolia*) and a few landscape trees as subdominants in the tree canopy creating a *Pinus radiata*/*Quercus agrifolia* association in parts of the airport. The shrub layer varies from landscape and ruderal species near the terminal and existing airport parking, to nonnative grassland adjacent to Highway 68, and to dense maritime chaparral in and near the parcel with Assessor Parcel Number ending 5000 (APN 5000). Numerous occurrences of Yadon's piperia are in the Monterey pine forest on the south side of the airport.

3.2.3 Arctostaphylos Pumila Shrubland (Sandmat Manzanita Chaparral)

Sandmat manzanita chaparral is similar in definition to central maritime chaparral (Holland 1986). This community consists of variable, thick-leaved shrubs of moderate to high cover, dominated by sandmat manzanita. Sandmat manzanita chaparral is typically located on well-drained, sandy substrates within the summer coastal fog zone in scattered locations near Monterey and Fort Ord. On the airport, this community includes mixed stands with woollyleaf manzanita (*Arctostaphylos tomentosa*), and as a shrub layer in the Monterey pine forest. The stands are dense to moderately dense with large areas being impassable. Some areas of this community are almost completely covered with manzanita species, whereas, other areas have a greater presence of common chaparral species. Manzanita species observed in the chaparral include sandmat manzanita, woollyleaf manzanita (*Arctostaphylos tomentosa* ssp. *tomentosa)*, and bristly twig manzanita *(A. t.* ssp. *bracteosa)*. The common chaparral species include but are not limited to, black sage (*Salvia mellifera*), chamise (*Adenostoma fasciculatum*), California sage (*Artemisia californica*), and toyon (*Heteromeles arbutifolia*).

3.2.4 Quercus Agrifolia Woodland Alliance (Coast live oak Woodland)

Coast live oak woodlands feature coast live oak as the dominant evergreen tree, often reaching 30 to 75 feet in height and establishing dense canopies (Holland 1986). The shrub layer is typically poorly developed but may include species such as toyon (*Heteromeles arbutifolia*) and gooseberry (*Ribes* spp.). The herbaceous layer is dominated by native and exotic grasses and forbs.

The airport supports coast live oak woodland on the eastern, northern, and southern portions of the property. This community intergrades with the Monterey pine forest, sandmat manzanita chaparral, and other communities. The community on the airport has a shrub layer that includes poison oak (*Toxicodendron diversilobum*), California blackberry (*Rubus ursinus*), woollyleaf manzanita, Monterey ceanothus (*Ceanothus cuneatus* var. *rigidus*), Toro manzanita (*Arctostaphylos montereyensis*), black sage, and California sage. The herbaceous layer is patchy and includes a variety of annual grasses, fiesta flower (*Pholistoma auritum*), buttercups (*Ranunculus californicus*), and California melic (*Melica imperfecta*).

3.2.5 Baccharis Pilularis Shrubland Alliance (Coyote Brush Scrub)

Coyote brush scrub is similar in definition to central coastal scrub (Holland 1986). This is a shrubland community that is dominated by coyote brush (*Baccharis pilularis*) and includes mock heather (*Ericameria ericoides*), buckbrush (*Ceanothus cuneatus cuneatus*), California sage, black sage, and other scrub species. This community is indicative of disturbed places that are in the process of being recolonized by native shrubs. A small patch of this community occurs on the northeast portion of the study areas. The surrounding habitats include sandmat manzanita chaparral and ruderal areas. Based on the surroundings, the area supporting coyote brush shrubland was likely subject to past clearing and probably supported chaparral or coastal scrub associates prior to the disturbance. Other native plants found in the coyote brush shrubland include mock heather, California sage, and sand scrub ceanothus (*Ceanothus dentatus*).

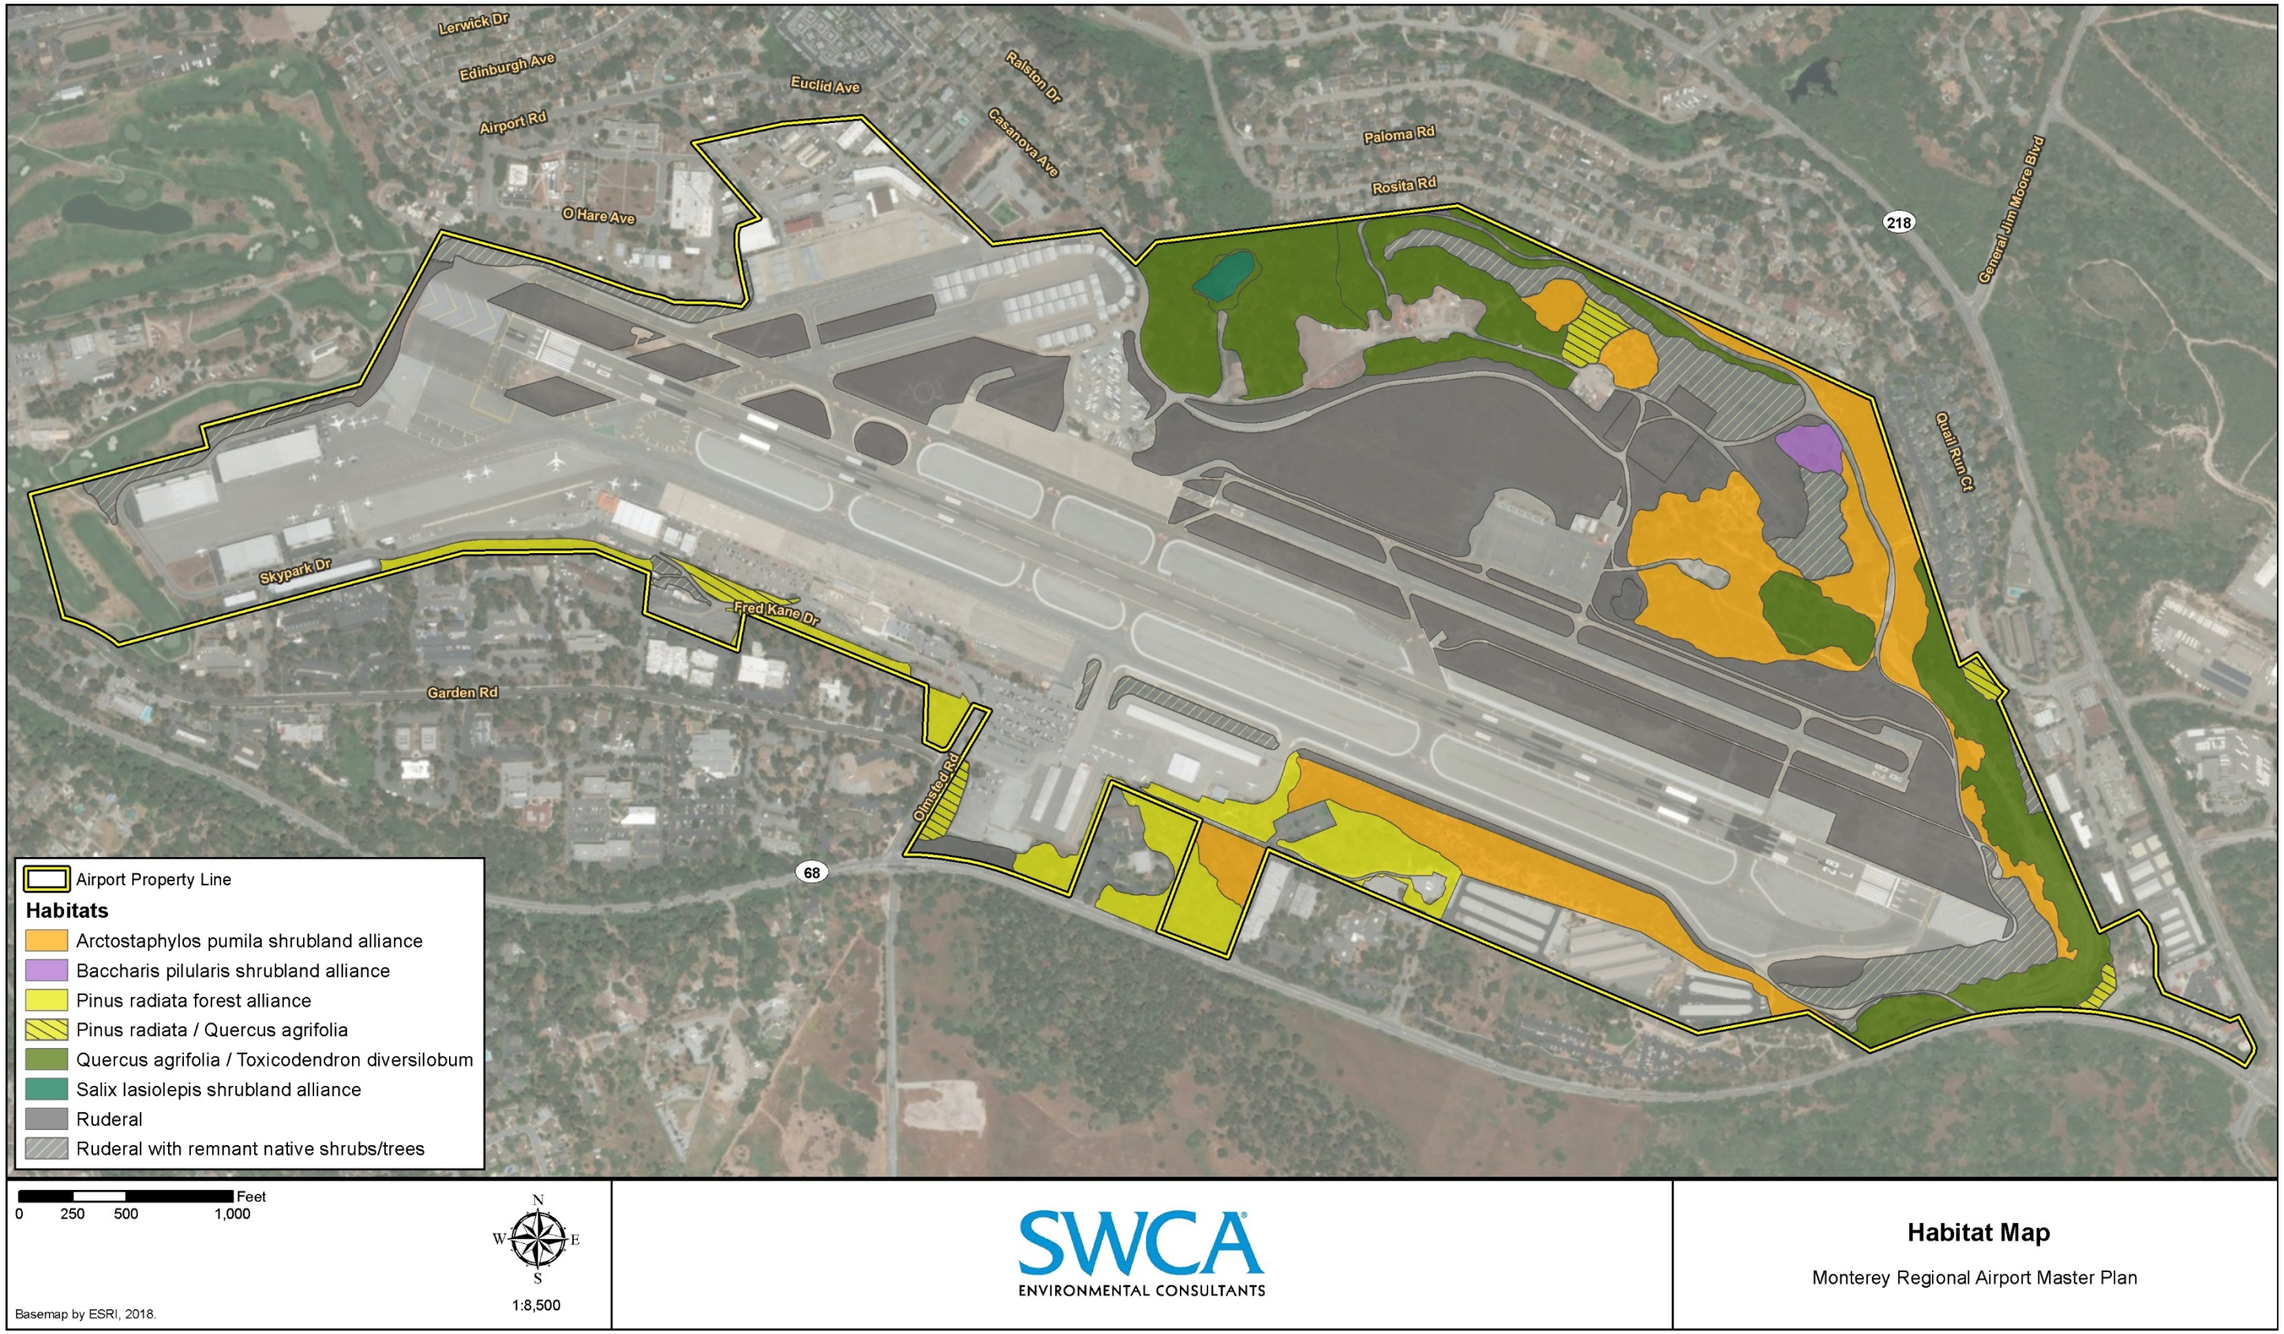

Figure 4. Habitat map.

This page intentionally left blank.

3.2.6 Salix lasiolepis Shrubland (Arroyo Willow Thickets)

Arroyo willow thickets are similar in definition to central coast riparian scrub, which consists of scrubby streamside thickets that are dominated by any of several willow species, including arroyo willow (*Salix lasiolepis*) (Holland 1986). The thickets vary in density from partially open to impenetrable. The understory commonly supports species such as California blackberry and stinging nettle (*Urtica dioica*) in drier sites, or cattail and sedges in mesic (moist) sites. Arroyo willow thickets occur on many soil types including sand and gravel bars in areas close to groundwater or surface water. The only arroyo willow thicket on the airport is in the northern detention basin. This low-lying area receives storm water from the airport property and directs the water through culverts and channels to the municipal stormwater system in the city of Del Rey Oaks.

3.3 Special-Status Plants Observed in the Study Areas

Table 6 below summarizes the special-status plants that were observed in the study areas. Figure 5 includes a map of the special-status species occurrences. Descriptions of the sandmat manzanita, Monterey spineflower, Eastwood's goldenbush (*Ericameria fasciculata*), Monterey ceanothus, Yadon's piperia, small-leaved lomatium (*Lomatium parvifolium*), seaside bird's beak, and Monterey pine observed in the study areas are provided in the sections following Table 6.

Table 6. Summary of Special-Status Species Observed in the Study Areas

Species Name	Legal Status Federal/State/CNPS	Occupied Study Areas
sandmat manzanita *Arctostaphylos pumila*	--/--/1B.2	Sandmat manzanita occurs in all study areas.
Monterey spineflower *Chorizanthe pungens*	FT/--/1B.2	Monterey spineflower occurs in the Highway 68 Frontage Road with Loop, North Access Road, GA Relocation, Proposed Parking and Circulation, Soil Deposition Areas, Frontage Road with Cul-de-Sac, Alternative 1 North Access Road and GA Relocation Area, and the Soil Deposition study areas.
Eastwood's goldenbush *Ericameria fasciculata*	--/--/1B.1	Eastwood's goldenbush occurs in the Highway 68 Frontage Road with Loop, North Access Road, Proposed Parking and Circulation, Soil Deposition Areas, Frontage Road with Cul-de-Sac, Alternative 1 North Access Road and GA Relocation Area, and the Soil Deposition study areas.
Monterey ceanothus *Ceanothus cuneatus* var. *rigidus*	--/--/4.2	Monterey ceanothus occurs in the Highway 68 Frontage Road with Loop, North Access Road, Terminal Area, Alternative 1 Parking and Circulation, and Alternative 1 N. Access Road and GA Relocation study areas.
Yadon's piperia *Piperia yadonii*	FE/--/1B.1	Yadon's piperia occurs in the Highway 68 Frontage Road with Loop, Proposed Parking and Circulation, Alternative 1 Parking and Circulation, Terminal Area, Frontage Road with Cul-de-Sac, Proposed Drainage Improvement, and Alternative 1 Drainage Improvement study areas.
small-leaved lomatium *Lomatium parvifolium*	--/--/4.2	Small-leaved lomatium occurs in the Highway 68 Frontage Road with Loop, North Access Road, Soil Deposition Areas, Frontage Road with Cul-de-Sac, Alternative 1 North Access Road and GA Relocation Area, and the Soil Deposition study areas.
seaside bird's beak *Cordylanthus rigidus ssp. littoralis*	--/SE/1B.1	Seaside bird's beak occurs in the Highway 68 Frontage Road with Loop and Frontage Road with Cul-de-Sac study areas.

Species Name	Legal Status Federal/State/CNPS	Occupied Study Areas
Monterey pine *Pinus radiata*	--/--/1B.1	Monterey pine trees occur in the Terminal Area, North Access Road, Alternative 1 North Access Road and GA Relocation, Soil Deposition Areas, Proposed and Alternative 1 Drainage Improvements, Highway 68 Frontage Road with Loop, and Highway 68 Frontage Road with Cul-de-Sac study areas.

Status Codes

-- = No status

Federal: FE = Federal Endangered; FT=Federal Threatened

State: SE=State Endangered; ST= State Threatened; SR= State Rare

CNPS: Rank 1B = rare, threatened, or endangered in California and elsewhere. Rank 2 = rare, threatened, or endangered in California, but more common elsewhere. Rank 3 = plants about which more information is needed. Rank 4 = a watch list plants of limited distribution.
Threat Code: _.1 = Seriously endangered in California (over 80% of occurrences threatened / high degree and immediacy of threat); _.2 = Fairly endangered in California (20-80% occurrences threatened); _.3 = Not very endangered in California (<20% of occurrences threatened or no current threats known)

3.3.1 Sandmat Manzanita (Arctostaphylos pumila)

Sandmat manzanita is a low-growing (typically less than 1.5 meters tall) evergreen shrub that occurs in maritime chaparral and in openings within Monterey pine forest. It is endemic to California and limited to areas around Monterey Bay, at elevation ranging from 3 to 205 meters. Sandmat manzanita typically occurs on sandy soils associated with stabilized dunes. The California Native Plant Society (CNPS) has included sandmat manzanita on List 1B.2. Sandmat manzanita is widespread on the airport property with numerous occurrences in the study areas.

3.3.2 Monterey Spineflower (Chorizanthe pungens)

Monterey spineflower is an annual herb that occurs at 3 to 450 meters in openings among chaparral, cismontane woodland, coastal dunes, coastal scrub, and valley and foothill grassland on sandy soils. Monterey spineflower is federally threatened under the Federal Endangered Species Act (FESA) and ranked as a CNPS 1B.2 species (CNPS 2018). The openings in the Monterey pine forest and maritime chaparral in the study areas provide good habitat for this species. Numerous occurrences of Monterey spineflower were observed in the study areas.

3.3.3 Eastwood's Goldenbush (Ericameria fasciculata)

Eastwood's goldenbush is a perennial shrub that occurs in openings within closed-cone coniferous forest, chaparral, coastal dunes, and coastal scrub. It is typically found in sandy soil at elevations ranging from 30 to 275 meters. Eastwood's goldenbush is ranked as a CNPS 1B.2 (CNPS 2018) species and is sporadically located in several of the study areas (refer to Table 6).

3.3.4 Monterey Ceanothus (Ceanothus cuneatus var. rigidus)

Monterey ceanothus is an evergreen shrub that occurs in closed-cone, coniferous forest, chaparral, and coastal scrub with sandy soils at elevation ranging from 3 to 550 meters. The *Ceanothus cuneatus* species is endemic to California with the *rigidus* variation being endemic to Monterey and San Luis Obispo Counties. CNPS has included Monterey ceanothus on List 4.2 (CNPS 2018). Species included on List 4.2 are considered to have a limited distribution and are "fairly endangered" in California. Monterey ceanothus was observed in various locations in the BSA with most the occurrences in the central maritime chaparral and the oak woodland located at the eastern end of the runways (see Figure 5).

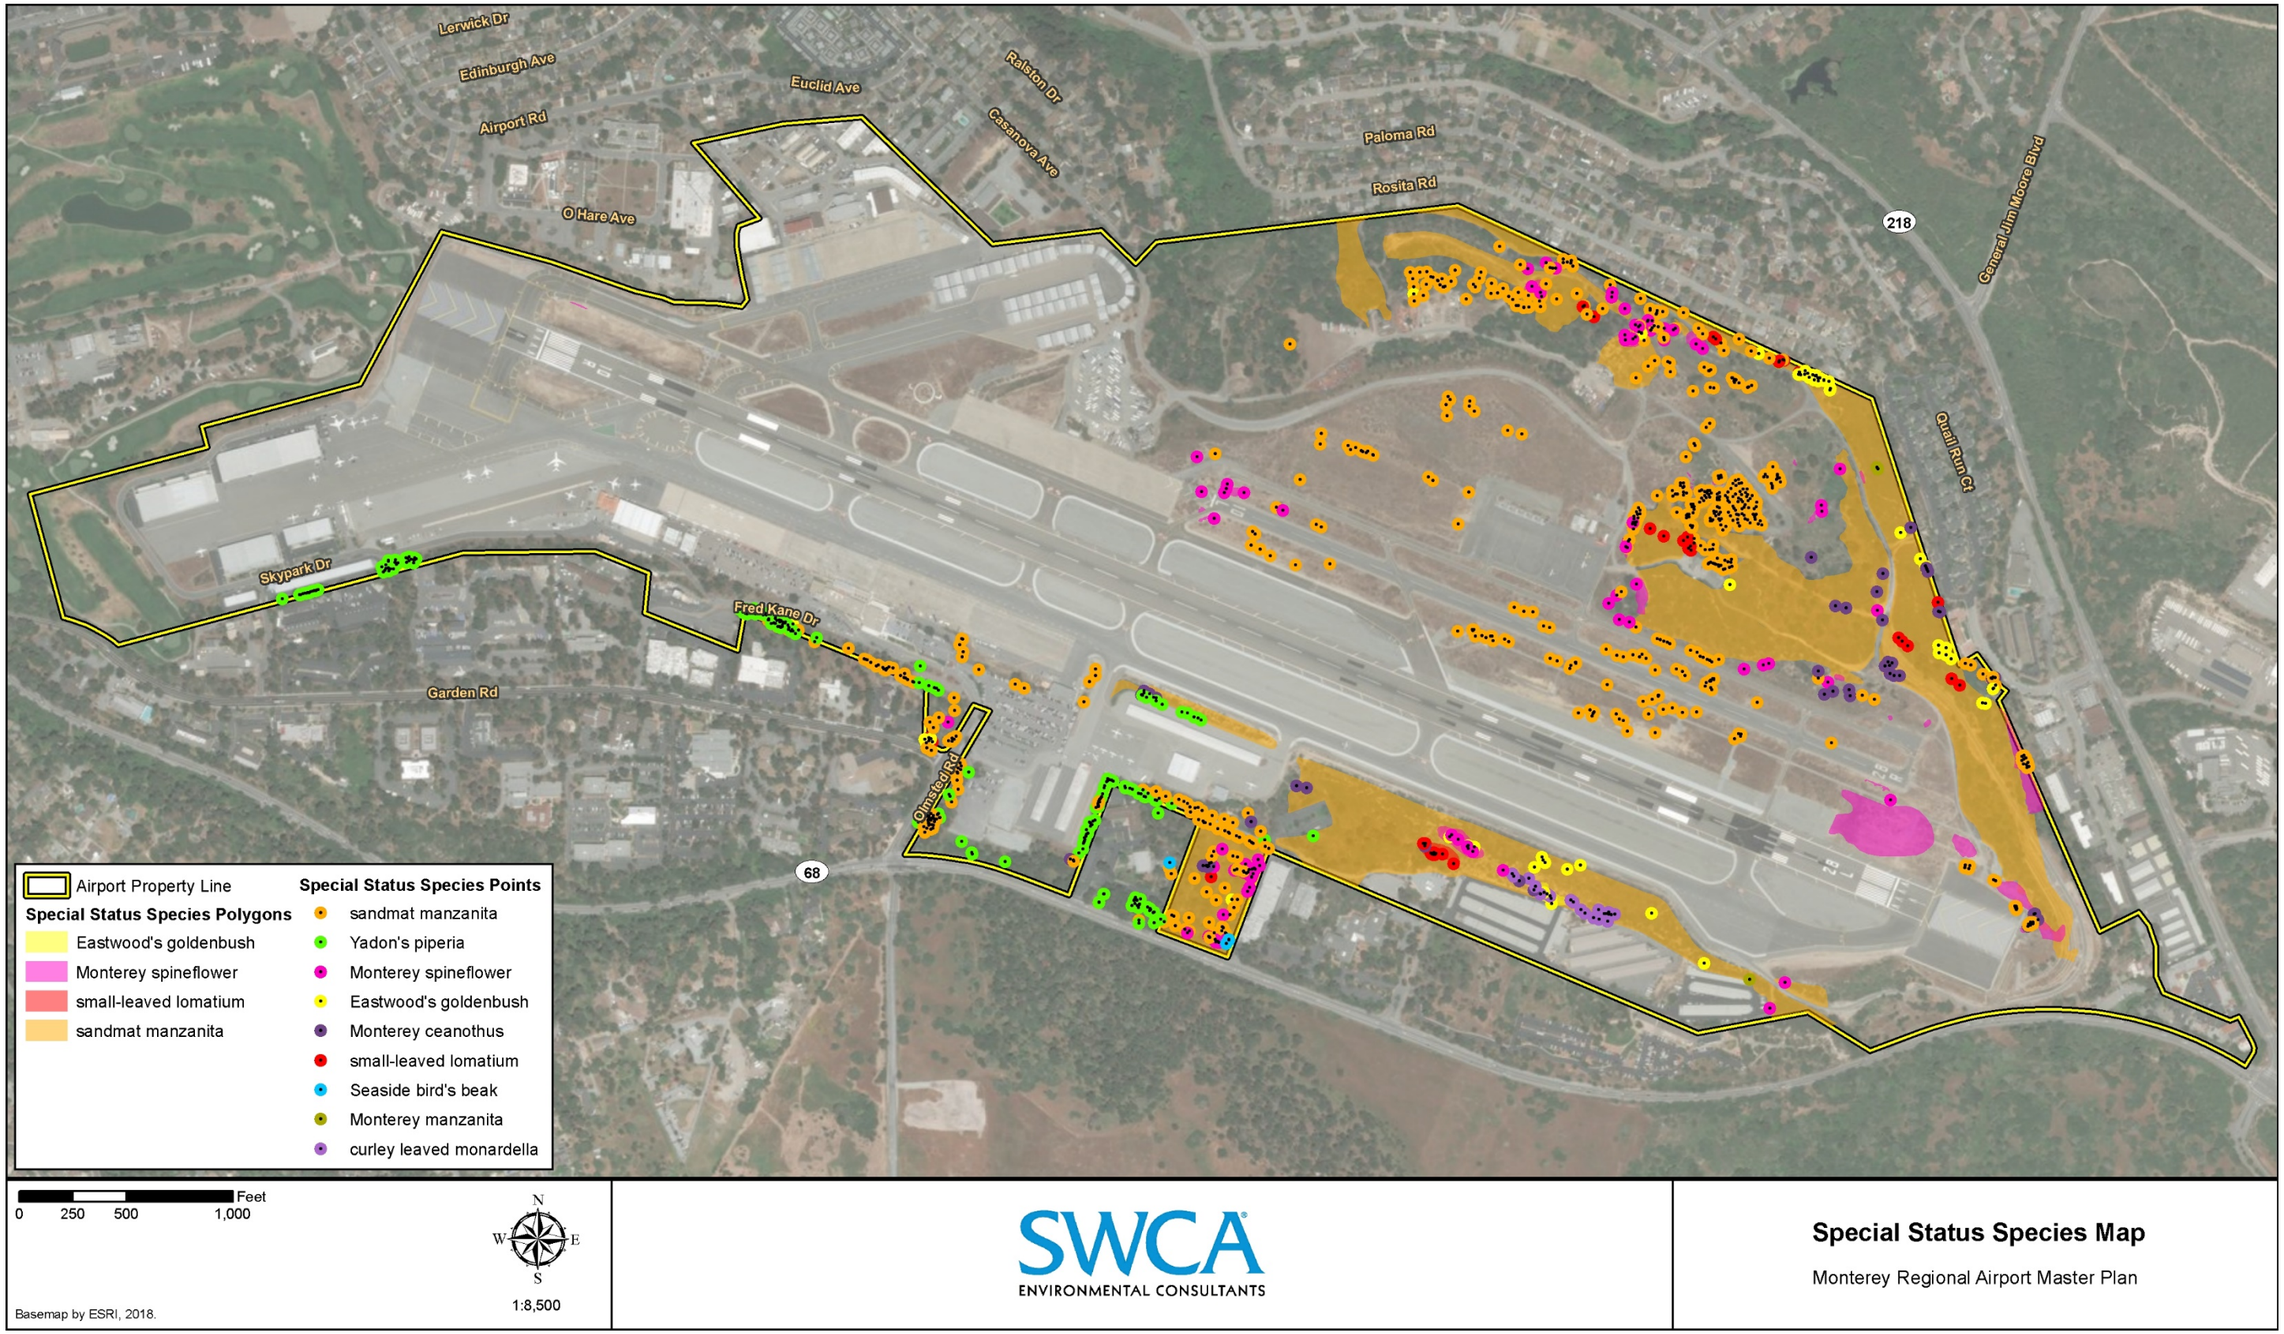

Figure 5. Map of special-status species occurrences.

This page intentionally left blank.

3.3.5 Yadon's Piperia (Piperia yadonii)

Yadon's piperia is a perennial herb that primarily occurs at elevation ranging from 10 to 510 meters in Monterey pine forests with sparse understories, or maritime chaparral with sandstone substrates and Hooker's manzanita (*Arctostaphylos hookeri*) (USFWS 1998). CNPS also reports some occurrences in coastal bluff scrub. Yadon's piperia is listed as endangered under the FESA and is included a CNPS Rank 1B.1 species (CNPS 2018). Numerous Yadon's piperia are located on the southern portion of the airport property and within several of the project study areas (see Table 6). The Yadon's piperia occurrences observed in the project study areas are largely concentrated in the Monterey pine forest, which includes maritime chaparral associates and nonnative vegetation.

3.3.6 Seaside Bird's Beak (Cordylanthus rigidus ssp. littoralis)

Seaside bird's beak is an annual herb that occurs in closed-cone coniferous forest, chaparral, cismontane woodland, coastal dunes, and coastal scrub with sandy soils. This species has been documented to occur at elevation ranging from 0 to 425 meters. Although it is more commonly found in intact native communities, it can persist in disturbed sites. This species is known from approximately 20 occurrences on the central California coast from northern Santa Barbara County to northern Monterey County. Seaside bird's beak is listed as endangered under the CESA and is a CNPS Rank 1B.1 species (CNPS 2018). Calflora documents three occurrences in the general vicinity of the airport (Calflora 2018). Most of these occurrences are located on the Robert Talbot property immediately east of the study areas; however, several individuals were observed in the Proposed Frontage Road Loop and the Alternative 1 Frontage Road Cul-de-Sac study areas.

3.3.7 Small-Leaved Lomatium (Lomatium parvifolium)

Small-leaved lomatium is a perennial herb that is endemic to California. This species has been documented in Santa Cruz, Monterey, San Luis Obispo, Santa Barbara, and Ventura Counties. It is most commonly found in chaparral and closed-cone pine forests. It is largely a coastal species and can be found in a variety of soil types. Small-leaved lomatium blooms January through June. The CNPS has applied the rare plant Rank 4.2 to this species, which indicates that small-leaved lomatium has a limited distribution and is moderately threatened in California. This species occurs in sporadic patches among the maritime chaparral on the airport property.

3.3.8 Monterey Pine (Pinus radiata)

Monterey pine is an evergreen coniferous tree that is restricted to Monterey, Santa Cruz, San Luis Obispo, and San Mateo Counties. This species is widely cultivated and planted; however, it is considered rare when associated with a natural stand. Currently, there are five known natural stands—three in the counties noted above and two located in Mexico. Monterey pine is an important forestry species in New Zealand and was widely seeded in Hawaii for reforestation purposes. Monterey pine is listed on two very different special-status lists. CNPS considers natural occurrences of Monterey pine to be "rare, threatened, or endangered in California and elsewhere (1B.1)" (CNPS 2018). The California Invasive Plant Council considers the species to have a limited threat to natural ecosystems outside of its native range. Most of the occurrences on the airport are naturally occurring and are most likely part of the natural Monterey population.

3.4 Federal and State Protected Wildlife

FESA- and/or CESA-protected animal species were not observed in the study areas during the surveys. However, the airport property supports suitable habitat for nesting birds, which are protected under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (CFGC), and California legless lizards (*Anniella pulchra*). California red-legged frog (CRF) (*Rana draytonii*) and California tiger salamander (CTS) (*Ambystoma californiense*) have documented occurrences within 1.3 miles of the airport. This section provides an evaluation of the potential for the master plan and short-term projects study areas to support these species.

3.4.1 Migratory Birds

The entire airport property provides suitable habitat for nesting birds. A variety of bird species may use the trees and shrubs on the airport to build nests or forage in; raptors may use the trees for nesting and the shrub and grass areas for foraging. If project activities are conducted between March and September, birds may be nesting within or adjacent to the affected area(s) and the individuals could be directly or indirectly impacted. The MBTA and CFGC protects many bird species from take; to maintain compliance with the MBTA and CFGC, the proposed short-term projects and future master plan development projects should avoid take of nesting birds.

3.4.2 California Red-Legged Frog (Rana draytonii)

CRF is listed as threatened under the FESA. A member of the true frog family Ranidae, CRF occur mainly in coastal drainages and aquatic habitats from the vicinity of Point Reyes, California south to northwestern Baja California, Mexico. Monterey, San Luis Obispo, and Santa Barbara Counties support the greatest amount of occupied habitat. CRF breed in aquatic sites with deep pools, emergent vegetation, and overhanging vegetation, but also use riparian and upland areas throughout their life cycle. Adult frogs with access to permanent water will generally remain active throughout the summer. In cooler areas, they may hibernate in burrows or other refugia in the winter. CRF adults may move upstream and downstream of breeding habitat to forage and find refugia (USFWS 2017).

SWCA reviewed the CNDDB to determine if any CRF occurrences have been documented within the a 3.1-mile radius around the airport property. There have not been any documented observations of CRF on the airport property. In addition, SWCA has been conducting biological surveys on the airport property since 2009 and has not observed CRF on the airport. As of May 2018, CNDDB does not document any CRF occurrences on the airport (CNDDB 2018). The closest occurrence (#939) is located approximately 1.3 miles southwest of the airport in Montara Pond 1. Montara Pond 1 is an artificially maintained pond at the Tehama Golf Club. The 1.3 miles between occurrence #939 and the airport is characterized by steep terrain, open space, mining operations, Highway 68 and other paved roads, and urban development. These land uses greatly limit the potential for straight-line movements from Montara Pond 1 to the airport and associated short-term project sites. Therefore, it is unlikely that the short-term projects would affect CRF.

A stormwater detention basin in the coast live oak woodland at the northwestern portion of the airport property supports suitable habitat for CRF. The basin supports a willow thicket that is occasionally trimmed and the basin water levels fluctuate based on the season. Due to the trimming and fluctuation water levels, the habitat in the basin varies and is unlikely to support breeding CRF, but it provides marginal summer shelter habitat for the species. Considering the habitat characteristics, any occurrence of CRF in the basin would likely be transitory. Considering these factors, protocol surveys for CRF would likely be inconclusive.

3.4.3 California Tiger Salamander (Ambystoma californiense)

The CTS is a large, stocky, terrestrial salamander in the Ambystomatidae family. Adult males can be 8 inches long, whereas, females are generally less than 7 inches long. Coloration consists of white or pale-yellow spots or bars on a black background on the back and sides. Adults are primarily nocturnal in their aboveground activities and are generally active during nights of heavy rainfall (USFWS 2009).

The species is restricted to grasslands and low (below 1,500 feet) foothill regions where lowland aquatic sites are available for breeding. CTS prefer natural ephemeral pools or ponds; stock ponds will be utilized if they are dry out seasonally. Adults travel to these ponds from upland habitat during winter rains. They spend two to five weeks in the water for reproduction, depending on gender (USFWS 2009). Ninety percent of the adult CTS lifetime is spent in the upland habitat in small mammal burrows. These terrestrial populations are often difficult to observe. Adults do not breed every year and can live to be at least 10 years old. Studies have shown that CTS use an approximately 2,200-foot radius around a breeding pond (364 acres) (USFWS 2009). Dispersal movements of up to 0.62 mile are considered likely (USFWS 2009).

SWCA reviewed the CNDDB to identify documented CTS occurrences within the airport property and 3.1 miles of the airport. No CTS occurrences are documented on the airport property. SWCA has been conducting biological surveys on the airport since 2009 and have not observed CTS on the airport. CNDDB documents three occurrences within 3.1 miles of the airport:

- **Occurrence #394:** Tehama Golf Club Montara Pond 1, located 1.3 miles south-southeast of the eastern project boundary; habitat is comprised of a former cattle stock pond. This is in the same general area as the CRF occurrence #939 discussed above.
- **Occurrence #167:** located 2.3 miles east of the eastern project boundary; habitat is comprised of a vernal pool with multiple rodent burrows on the former Fort Ord military reservation.
- **Occurrence # 166:** located 3.0 miles east of the eastern project boundary; habitat is comprised of a vernal pool on the former Fort Ord military reservation.

Much like the CRLF occurrences, the CTS occurrences are separated from the project site by steep terrain, open space, Highway 218, Highway 68, other paved roads, and urban development. These land uses greatly limit the potential for straight line movements from the documented CTS occurrences to the project site.

3.4.4 California Red-Legged Frog and California Tiger Salamander Discussion

The project study areas are largely comprised of developed lands and upland habitats including ruderal vegetation, coast live oak woodland, Monterey pine forest, and maritime chaparral. The only mesic sites in the study areas are the detention basin discussed above and a low-lying stormwater collection area that is situated between Highway 68 and the existing GA hangars. The stormwater collection area receives overland runoff from the impermeable surfaces surrounding the GA hangars and the highway. The area may have been excavated to serve as a stormwater collection area; however, it is not a defined basin and does not have bed or bank features. The stormwater collection site has native sandy soils that have a rapid percolation rate; therefore, standing water is rarely present. The vegetation in the stormwater collection area includes Monterey pine trees, landscape trees, and dense grasses at the ground level. Herbaceous species observed in the area included creeping wild rye (*Elymus triticoides*), velvet grass (*Holcus lanatus*), annual blue grass (*Poa annua*), and Baltic rush (*Juncus balticus*). The sporadic and short-lived presence of water and the lack of emergent vegetation in the stormwater collection area indicates that area is not suitable for CTS or CRF breeding habitat. This coupled with the distance and urban development

between other breeding habitats indicates that CRF and CTS are not likely to use the area as upland habitat.

As discussed above, a stormwater detention basin on the northern portion of the airport supports a willow thicket and has fluctuating water levels. The habitats immediately surrounding the detention basin include disturbed oak woodland with a grassy understory and sporadic shrubs. Urban development dominates the landscape beyond the oak woodland. The general habitat conditions in the basin are marginal for CRF and/or CTS; however, the periodic maintenance in the basin and the urban development around the basin likely preclude the presence of CRF and/or CTS in the area. As proposed, the Master Plan would designate the detention basin and surrounding oak woodland as conservation open space.

3.4.5 California Legless Lizards (Anniella pulchra pulchra, A. p. nigra)

The CDFW recognizes two subspecies of legless lizard in coastal California—silvery legless lizard (*A. p. pulchra*) and black legless lizard (*A. p. nigra*). Both of which are herein referred to as California legless lizards and are considered as California Species of Special Concern (SSC) by CDFW. These are elusive, fossorial (sub-surface), coastally distributed lizards ranging from the San Francisco Bay area southward into northern Mexico (Zeiner et al. 1990). Suitable habitat includes loose soils of coastal dune, valley foothill woodland, chaparral, and coastal scrub areas, where the species forages at the bases of vegetation and under leaf litter.

The sandy soils in the project study areas provide suitable habitat for California legless lizards. SWCA biologists have conducted numerous legless lizard survey and monitoring efforts as part of the recent Monterey Regional Airport Runway Safety Area Project (RSA Project) and other projects on the airport. These survey and monitoring efforts included excavation of over 45 acres of legless lizard habitat and only one individual was identified. The past survey results indicate that the species is likely present in low numbers on the airport; therefore, implementation of predisturbance surveys for legless lizards and other reptile species are recommended to ensure that project construction would not adversely affect native reptile species.

3.4.6 Federal and State Regulated Habitats

3.4.6.1 JURISDICTIONAL WATERS

The airport property does not contain any jurisdictional waters. There are two wet areas on the airport—the stormwater collection area situated between Highway 68 and the existing airport parking and the northern detention basin discussed above. The stormwater collection area is low-lying, but does not include a bed or banks, support riparian vegetation, have an ordinary high water mark, or have any hydrological connection to a navigable water or other waterway. The stormwater collection area receives overland flow from the adjacent hangars, parking areas, and highway.

The northern detention basin is a maintained stormwater detention area with earthen and concrete banks and a spillway. The basin is designed to allow stormwater to percolate into the soil; therefore, the spillway is rarely used for stormwater flow. The spillway connects to the municipal stormwater system to the north and does not direct flows to traditional navigable waters, relatively permanent waters, or other potential waters of the United States; therefore, it is unlikely that the detention basin would be considered "waters of the United States."

3.4.6.2 CRITICAL HABITAT

The airport property and various project areas are not located in any critical habitat units. This determination is based on information obtained from the Trusted Resources List obtained from the USFWS IPaC (see Appendix B) and various *Federal Register* (FR) documents. Numerous species have designated habitat in Monterey County; some of the critical habitat units located near the airport property are discussed below.

- On May 29, 2002, the USFWS designated approximately 18,829 acres in Santa Cruz and Monterey Counties as Monterey spineflower critical habitat (67 FR 37498–37546). This designation included airport property; however, the designation was challenged. In January 2008, the USFWS published a revised ruling (73 FR 1525) that does not designate airport properties as critical habitat for Monterey spineflower.
- On October 24, 2007, the USFWS designated eight critical habitat units for Yadon's piperia in Monterey County (72 FR 60422); Unit 4 – Aguajito is the closest to the action area. Unit 4 includes two subunits consisting of 108 acres, which are located approximately 0.83 miles south of the airport.
- On June 19, 2012, the USFWS designated critical habitat for the Pacific Coast population of western snowy plover (*Charadrius alexandrinus nivosus*) (77 FR 36727–36869). Unit CA 22 is the closest unit to the airport and is located approximately 1.5 miles west of the airport.

4 REGULATORY OVERVIEW

4.1 Federal Policies and Regulations

4.1.1 Federal Endangered Species Act of 1973

The FESA (50 Code of Federal Regulations [CFR] 17) provides legal protection for plant and animal taxa that are in danger of extinction and classified as either threatened or endangered under the FESA. The FESA requires federal agencies to make a finding on all federal actions, including the approval by an agency of a public or private action, such as the issuance of an U.S. Army Corps of Engineers (USACE) permit under Section 404 of the Clean Water Act (CWA), as to the potential to jeopardize the continued existence of any listed species potentially impacted by the action.

Section 9 of the FESA protects federally listed plant and animal species from unlawful take. "Take" is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." The USFWS regulates activities that may result in "take" of listed species. Federally designated critical habitat is also regulated. Constraints to listed species resulting from the implementation of a project would require the responsible agency or individual to formally consult with the USFWS to determine the extent of impact to a listed species.

Project-related activities that could result in impacts, such as take, to listed species require federal agencies to consult with the USFWS to determine the extent of impacts to listed species. Once USFWS reviews a Biological Assessment for a project, they may issue a federal Biological Opinion and Incidental Take Statement under FESA Section 7 that includes provisions for legal take, provided that specific mitigation measures are employed for construction.

4.1.2 Migratory Bird Treaty Act of 1918

The MBTA protects all migratory birds, including their eggs, nests, and feathers. The MBTA was originally drafted to put an end to the commercial trade in bird feathers, popular in the latter part of the 1800s. The MBTA is enforced by the USFWS, and potential impacts to species protected under the MBTA are evaluated by USFWS in consultation with other federal agencies. On April 11, 2018, the USFWS issued guidance on the recent M-Opinion affecting MBTA implementation. The M-Opinion concludes that the take of birds resulting from an activity is not prohibited by the MBTA when the underlying purpose of that activity is not to take birds. The USFWS interprets the M-Opinion to mean the MBTA prohibitions on take apply when the purpose of the action is to take migratory birds, their eggs, or their nests. Working with other federal agencies on migratory bird conservation is an integral mission of the USFWS; therefore, the USFWS maintains that potential impacts to migratory birds resulting from federal actions should be addressed under NEPA. The airport property supports a variety of habitats for nesting birds. If proposed ground-disturbing activities were implemented during the nesting bird season, pre-disturbance nesting bird surveys should be conducted to avoid impacts to nesting migratory birds.

4.1.3 Section 404 of the Clean Water Act

The USACE is responsible for the issuance of permits for the placement of dredged or fill material into "waters of the United States" pursuant to Section 404 of the CWA (33 United States Code [USC] 1344). As defined by USACE in 33 CFR 328.3(a)(parts 1–6), "waters of the United States" are summarized as:

> *"Those waters that are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; tributaries and impoundments to such waters; all interstate waters including interstate wetlands; and territorial seas."*

If a project would result in dredge or fill of "waters of the United States," the project would be subject to Section 404 of the CWA, based on review by the USACE. The airport property, including the BSA, does not contain any jurisdictional wetlands or other waters that would be subject to the CWA.

4.2 State Policies and Regulations

4.2.1 California Fish and Game Code

CFGC Section 3503 – Protections of Bird's Nests includes provisions to protect the nests and eggs of birds. Section 3503 states: "It is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto."

Per CFGC Section 2835, in absence of a CDFW-approved Natural Community Conservation Plan, the CDFW cannot authorize take of a Fully Protected species. The classification of Fully Protected was the state's initial effort in the 1960s to identify and provide additional protection to those animals that were rare or faced possible extinction. Most "fully" protected species have been listed as threatened or endangered species under the CESA. Fully Protected species lists were created for fish, mammals. amphibians and reptiles, birds, and mammals. CFGC Section 3511 (birds), Section 4700 (mammals), Section 5050 (reptiles and amphibians), and Section 5515 (fish) include provisions to protect Fully Protected species, such as: (1) prohibiting take or possession "at any time" of the species listed in the statute, with few exceptions; (2) stating that "no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to "take" a species that has been designated as Fully Protected; and (3) stating that no previously issued permits or licenses for take of these species "shall have any force or effect" for authorizing take or possession. Unless an applicant has developed a CDFW-

approved Natural Community Conservation Plan, CDFW is unable to authorize incidental take of Fully Protected species when activities are proposed in areas inhabited by those species.

The CDFW also manages the California Native Plant Protection Act of 1977 (NPPA) (CFGC Section 1900 et seq.), which was enacted to identify, designate, and protect rare plants. In accordance with CDFW guidelines, plant species with CNPS Ranks 1A, 1B, 2A, 2B, and 3 are considered "rare" under the NPPA. Impacts to plants with these rarity rankings must be fully evaluated under CEQA. Plants with CNPS Rank 4 have limited distributions but are not necessarily eligible for listing. It is recommended that impacts to plants with CNPS Rank 4 also be evaluated per CEQA.

Pursuant to Division 2, Chapter 6, Sections 1600–1602 of the CFGC, the CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake, which supports fish or wildlife. The CDFW defines a "stream" (including creeks and rivers) as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation." The CDFW's definition of "lake" includes "natural lakes or man-made reservoirs." The CDFW jurisdiction within altered or artificial waterways is based upon the value of those waterways to fish and wildlife.

4.2.2 California Endangered Species Act of 1984

California has a parallel mandate to the FESA, which is embodied in the CESA and the NPPA. The CESA ensures legal protection for plants listed as rare or endangered, and wildlife listed as threatened or endangered. The CDFW regulates activities that may result in the "take" of such species. The CDFW also maintains a list of California SSC based on limited distribution, declining populations, diminishing habitat, or unusual scientific, recreational, or educational value. Under state law, CDFW is empowered to review projects for their potential to impact state-listed species and SSC, and their habitats.

Take of state-listed species would require a Section 2081 Incidental Take Permit from CDFW. This process requires submittal of a sensitive species study and permit application package, and is similar to the FESA Section 10 process, except that CDFW is the regulatory and decision-making agency. A CDFW 2081 Incidental Take Permit typically has mitigation requirements. If CDFW concurs that impacts to a state-listed species would likely result from a project, alternatives, and measures to avoid or reduce the impacts must be identified in a Section 2081 permit to allow for incidental take authorization. CDFW may also include compensatory mitigation (mitigation/conservation bank) requirements for impacts to habitat for listed plants and wildlife.

4.2.3 Section 401 of the Clean Water Act of 1977

Section 401 of the CWA and its provisions ensure that federally permitted activities comply with the federal CWA and state water quality laws. Section 401 is implemented through a review process that is conducted by the Regional Water Quality Control Board (RWQCB) and is triggered by the Section 404 permitting process.

4.2.4 Senate Bill 1334

The passage of Senate Bill (SB) 1334 enacted Public Resources Code (PRC) Section 21083.4, which maintains that the potential conversion of oak woodland is subject to CEQA and is to be mitigated. Per SB 1334 and PRC Section 21083.4, all California counties are required to adopt oak woodlands management plans and ordinances that require a discretionary permit for oak woodland conversions and set a minimum mitigation standard.

5 THRESHOLDS OF SIGNIFICANCE

Guidance for determining CEQA significance thresholds is based on Appendix G of the State CEQA Guidelines. Using these guidelines, activities requiring CEQA review would have a significant impact on biological resources if they would:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by the CDFW or the USFWS;
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by CDFW or USFWS;
3. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA;
4. Interfere substantially with the movement of any resident or migratory species of wildlife, wildlife corridors, or wildlife nursery sites;
5. Conflict with any local policies or ordinances protecting biological resources; and/or
6. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

6 SHORT-TERM PROJECTS IMPACT ANALYSIS

This impact assessment focuses on identifying potential impacts associated with implementation of the proposed short-term projects and is based on the site's existing conditions, the regulatory setting at the time that this report was completed, and the project description provided by the Airport. The emphasis is on determining the potential effects of the short-term projects on federal, state, and locally regulated species and habitats in the project study areas. Adverse impacts could occur if a component of the proposed short-term projects would result in temporary or permanent modification to jurisdictional habitats or to habitats occupied by special-status species. Where potential impacts to biological resources have been identified, measures for avoiding, minimizing, or mitigating adverse effects to the resources are recommended. Impact calculations are based on the conceptual site plans and are subject to refinement.

The two project alternatives include multiple components that are associated with the goal of increasing the runway-taxiway separation to 327.5 feet between Taxiway A and Runway 10R-28L. Although the project components are connected by the common goal, each project component would affect different areas and resources within the study areas. As such, Chapters 6 and 7 discuss the impacts and recommended avoidance and/or mitigation measures associated with the study areas that were defined to address the various project components.

6.1 Threshold #1: Candidate, Sensitive, or Special-Status Species

For the purpose of this analysis, candidate, sensitive, or special-status plant and wildlife species are identified as follows:

- Plants and animals listed or proposed for listing as threatened or endangered under the FESA (50 CFR 17.1—17.78).

- Plants and animals that are candidates for possible future listing as threatened or endangered under the FESA. From the February 28, 1996, *Federal Register*, page 7597: "those species for which the Service has on file sufficient information on biological vulnerability and threat(s) to support issuance of a proposed rule to list but issuance of the proposed rule is precluded."
- Plants and animals that meet the definitions of rare or endangered species under CEQA (State CEQA Guidelines Section 15380).
- Plants considered by the CNPS to be "rare, threatened, or endangered" in California (CNPS Rare Plant Ranks 1A, 1B, 2A, 2B, and 3).
- Plants listed under the California NPPA (CFGC Section 1900 et seq.).
- Animals listed or proposed for listing by the State of California as threatened or endangered under the CESA (14 California Code of Regulations [CCR] 670.5).
- Plants listed or proposed for listing by the State of California as threatened or endangered under the CESA pursuant to CFGC Sections 1904 (NPPA), 2074.2, and 2075.5.
- Plants and wildlife considered sensitive by other federal and/or state natural resource agencies (e.g., United States Forest Service, Bureau of Land Management).
- Animal species of special concern to the CDFW.
- Animal species that are fully protected in California (CFGC Sections 3511 [birds], 4700 [mammals], and 5050 [reptiles and amphibians]).

6.1.1 Proposed Project

Table 7 summarizes the potential impacts to candidate, sensitive, or special-status species associated with the Proposed Project. The discussions following Table 7 provide details of the impacts to each resource. Refer to Section 7, Short-Term Projects Mitigation for the measures listed in each discussion below.

Table 7. Summary of Impacts to Candidate, Sensitive, or Special-Status Species associated with the Proposed Project

Resource	Proposed Project Impacts by Project Study Area (ind. = individuals)							Total Impact
	Terminal Area	Parking & Circulation	Frontage Road Loop	Drainage Improvements	N. Access Road	GA Relocation	Soil Deposition	
sandmat manzanita	157 ind.	63 ind.	180 ind.	15 ind.	716 ind.	26	361 ind.	**1,518 ind.**
Monterey pine	30 ind.	37 ind.	165 ind.	0	32 ind.	0	59 ind.	**323 ind.**
Eastwood's goldenbush	0	0	1 ind.	0	6 ind.	0	1 ind.	**8 ind.**
Monterey ceanothus	9 ind.	1 ind.	0	0	8 ind.	0	0	**18 ind.**
small-leaved lomatium	0	0	32 ind.	0	16 ind.	0	1 ind.	**49 ind.**
Monterey spineflower	0	37 ind.	136 ind.	0	15 ind.	126 ind.	225 ind.	**539 ind.**
Yadon's piperia	53 ind.	39 ind.	323 ind.	45 ind.	0	0	0	**460 ind.**

6.1.1.1 SANDMAT MANZANITA

Sandmat manzanita is a CNPS Rank 1B.2 plant that is widespread on the airport property. It occurs in all the Proposed Project study areas. Construction of the Proposed Project components would result in the

direct removal of the sandmat manzanita individuals located in the disturbance areas. Table 7 provides the estimated numbers of individuals that could be removed by each of the Proposed Project components. In total, the proposed short-term project components have the potential to directly remove 1,518 sandmat manzanita plants. The following list provides the quantity and location of the anticipated sandmat manzanita plant removals. Measures BIO-1 and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts on sandmat manzanita.

- **Terminal Area:** Approximately 157 sandmat manzanita plants would be removed during the construction of the new airport terminal and associated aircraft ramp. The individuals to be removed are in the ruderal vegetation that currently exists just north of the existing GA hangars, in the ruderal vegetation located adjacent to the existing ARFF station, and in the Monterey pine forest located on the bank that is immediately south of the GA ramp and hangars.
- **Parking and Circulation:** Approximately 63 sandmat manzanita plants would be removed during the construction of parking and circulation improvements that would occur on the southside of the airport. Most of the impacts would result from the removal of the Monterey pine forest located just west of the existing Fred Kane Road and Olmstead Road intersection. This habitat and associated sandmat manzanita plants would be removed for the construction of new surface parking. Few individuals would be removed for the proposed traffic circle at Olmstead Road and Garden Road.
- **Highway 68 Frontage Road Loop:** Approximately 180 sandmat manzanita plants would be removed during the construction of the new Highway 68 Frontage Road Loop. All the impacts would occur in the Monterey pine forest and sandmat manzanita chaparral that are in the undeveloped parcel that is between the Fenton Keller and Robert Talbott properties.
- **Drainage Improvements:** Approximately 15 sandmat manzanita plants would be removed during the construction of the drainage improvements that would occur on the southside of the airport at the Highway 68 and Olmstead Road intersection.
- **North Access Road:** Approximately 716 sandmat manzanita plants would be removed during the construction of the proposed north access road. The proposed north access road would traverse the hillside just east of the runways and the undeveloped lands located just north of the air operations area (AOA). This area supports dense sandmat manzanita chaparral and coast live oak woodland.
- **General Aviation Relocation:** Construction of the expanded north GA area would result in the removal of approximately 26 sandmat manzanita plants that occur in the ruderal vegetation. These individuals are routinely mowed for fire abatement and are not part of a native plant community.
- **Soil Deposition Areas:** Construction of the relocated commercial terminal apron would require excavating and stockpiling large quantities of soil. The excavated soil would be stockpiled in five soil deposition areas located on the northern part of the airport property. The soil stockpiles would result in the removal of approximately 361 sandmat manzanita plants. Most of this impact would occur in the largest of the five stockpile areas that would be placed in the coast live oak woodland, Monterey pine forest, sandmat manzanita chaparral, and ruderal habitats that are located immediately north of the existing industrial lease areas on the airport.

6.1.1.2 MONTEREY PINE

Monterey pine is a CNPS Rank 1B.1 plant that is widespread on the airport property. It occurs in all the Proposed Project study areas, with the exception of the GA relocation sites. The Monterey pine forests on the airport are largely intermixed with the maritime chaparral. Fire suppression in the maritime chaparral has allowed the Monterey pines to become established in the chaparral community. Monterey pines and

other tall trees create site barriers for pilots and can be problematic for safe operations. Therefore, airports commonly remove tall trees under Federal Aviation Regulation (FAR) Part 77, Obstructions to Navigation. Construction of the Proposed Project components would result in the removal of the Monterey pines in the disturbance areas. Table 7 above provides the estimated numbers of individuals that could be removed by each of the Proposed Project components. The following list provides the quantity and location of the anticipated Monterey pine tree removals. Measures BIO-3 and BIO-13 through BIO-19 are recommended to address the Proposed Project's impacts on Monterey pines.

- **Terminal Area:** 30 Monterey pine trees would be removed during the construction of the new airport terminal and associated aircraft ramp. The individuals to be removed are in the Monterey pine forest located on the bank that is immediately south of the GA ramp.
- **Parking and Circulation:** 37 Monterey pine trees would be removed during the construction of parking and circulation improvements that would occur on the south side of the airport. Most of the impacts would result from the removal of the Monterey pine forest located just west of the existing Fred Kane Road and Olmstead Road intersection for the construction of new surface parking. Few individuals would be removed for the proposed traffic circle at Olmstead Road and Garden Road and the proposed parking structure.
- **Highway 68 Frontage Road Loop:** 165 Monterey pine trees would be removed during the construction of the new Highway 68 Frontage Road Loop. All these impacts would occur in the ruderal habitat located between the existing airport parking and Highway 68 and in the Monterey pine forest and sandmat manzanita chaparral that are in the undeveloped parcel that is between the Fenton Keller and Robert Talbott properties.
- **North Access Road:** 32 Monterey pine trees would be removed during the construction of the proposed north access road. The proposed north access road would traverse the hillside just east of the runways and the undeveloped lands located just north of the AOA. These areas support dense sandmat manzanita chaparral and coast live oak woodland that harbor sporadic Monterey pine trees.
- **Soil Deposition Areas:** The soil stockpiles would result in the removal of approximately 59 Monterey pine trees. Construction of the proposed airport terminal would require excavating and stockpiling large amounts of soil. The excavated soil would be stockpiled in five soil deposition areas on the northern part of the airport property.

6.1.1.3 EASTWOOD'S GOLDENBUSH

Eastwood's goldenbush is a CNPS Rank 1B.1 species that has sporadic occurrences on the airport property, with the highest concentrations in the northeast portion of the property. This species was observed in the Parking and Circulation, Highway 68 Frontage Road Loop, North Access Road, and Soil Deposition study areas. The Proposed Project would remove one occurrence from the Highway 68 Frontage Road Loop study area, one occurrence from the Soil Deposition study area, and six occurrences from the North Access Road study area. As designed, the Proposed Project would avoid the individuals located in the Parking and Circulation study area. Measures BIO-4 and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts on Eastwood's goldenbush.

6.1.1.4 MONTEREY CEANOTHUS

Monterey ceanothus is a CNPS Rank 4.2 species that was observed in the Parking and Circulation, North Access Road, and Terminal study areas. The Proposed Project would remove one occurrence from the Parking and Circulation study area, nine occurrences from the Terminal study area, and eight occurrences from the North Access Road study area. Measures BIO-5 and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts on Monterey ceanothus.

6.1.1.5 SMALL-LEAVED LOMATIUM

Small-leaved lomatium is a CNPS Rank 4.2 species that was observed in the Parking and Circulation, North Access Road, and Soil Deposition study areas. The Proposed Project would remove one occurrence from the Soil Deposition study area, 16 occurrences from the North Access Road study area, and 32 occurrences from the Highway 68 Frontage Road Loop study area. As designed, the Proposed Project would avoid the individuals located in the Proposed Project Parking and Circulation study area. Measures BIO-6 and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts small-leaved lomatium.

6.1.1.6 MONTEREY SPINEFLOWER

Monterey spineflower is a federally threatened and CNPS Rank 1B.2 species that is widespread on the airport property. This species is commonly found in open or disturbed areas on the airport. The Monterey spineflower population on the airport fluctuates seasonally making it difficult to predict the potential impacts to the species that could occur from future projects. Based on the project design and the 2016 and 2017 survey data, it is anticipated that the Proposed Project could impact approximately 539 individuals and the seed bank that occurs at the occurrences. The anticipated impacts would occur in the Parking and Circulation, Highway 68 Frontage Road Loop, North Access Road, GA Relocation, and Soil Deposition study areas. The impacts would include the removal of individuals, loss of soil seed bank from removing top soil, and the conversion of available habitat to developed areas. Measures BIO-7 and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts on Monterey spineflower.

6.1.1.7 YADON'S PIPERIA

Yadon's piperia is a federally endangered and CNPS Rank 1B.1 species that has numerous occurrences on the southern portion of the airport and sparse occurrences in the northern portion of the airport. Yadon's piperia was observed in the Terminal, Parking and Circulation, Highway 68 Frontage Road Loop, and Drainage Improvement study areas. As designed, the Proposed Project would remove 460 Yadon's piperia from these study areas. The Proposed Project has the potential to remove approximately 39% of the Yadon's piperia population that occurs on the airport property and the adjacent Fenton Keller property, and the loss of approximately 15% of the larger population occurring on and around the airport. The Proposed Project would permanently remove approximately 1.84 acres of occupied Yadon's piperia habitat. The impacts would include the removal of individuals, loss of soil seed bank from removing top soil, and the conversion of occupied habitat to developed areas. Measures BIO-8, BIO-9, and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts on Yadon's piperia.

6.1.1.8 SEASIDE BIRD'S BEAK

Seaside bird's beak is listed as endangered under the CESA and is a CNPS Rank 1B.1 species. The 2016 and 2017 surveys documented the presence of two (one in 2016 and one in 2017) individuals in the Proposed Project Highway 68 Frontage Road Loop study area. Utilizing the survey data, the Airport redesigned the frontage road alignment to avoid the known occurrences. As currently designed, the Proposed Project frontage road would be constructed approximately 25 feet to the north of the occurrences. Seaside bird's beak is an annual species. As such, it's population numbers and exact location can fluctuate from season to season. Measures BIO-10 and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts on seaside bird's beak.

6.1.1.9 CALIFORNIA LEGLESS LIZARDS

The vegetative communities in the Proposed Project study areas provide suitable habitat for silvery and black legless lizards (collectively referred to as California legless lizards) and other reptile species.

Grading activities could result in direct take of these reptiles. Direct take may include being struck by equipment, entrapped in stockpiled materials or trenches, or trampled or collected by construction personnel. Measures BIO-12 through BIO-23 are recommended to reduce the potential impacts to California legless lizards.

6.1.1.10 NESTING BIRDS

The habitats occurring in the Proposed Project study areas provide suitable nesting habitat for birds. Common passerines may use the oak woodland and maritime chaparral for nesting; raptors may use the oak and pine trees for nesting. These available nesting habitats would be impacted by land-clearing activities. If land-clearing activities are conducted between March and September, birds may be nesting within or adjacent to the affected area(s) and the individuals could be directly or indirectly impacted. Direct impacts may include loss of active nests during vegetation removal. Noise or other disturbances may cause an individual to abandon a nest resulting in an indirect impact. Minimization measure BIO-11 is recommended to avoid the potential impacts to nesting birds.

6.1.2 Alternative 1

Table 8 summarizes the potential impacts to candidate, sensitive, or special-status species associated with Alternative 1. The discussions following Table 8 provide details of the impacts to each resource. Refer to Section 7, Short-Term Projects Mitigation for the measures listed in each discussion below.

Table 8. Summary of Impacts to Candidate, Sensitive, or Special-Status Species associated with Alternative 1

Resource	Proposed Project Impacts by Project Study Area (ind. = individuals)						Total Impact
	Terminal Area	Parking & Circulation	Frontage Road Cul-de-Sac	Drainage Improvements	N. Access Road / GA Relocation	Soil Deposition	
sandmat manzanita	152 ind.	44 ind.	136 ind.	15 ind.	742 ind.	361 ind.	**1,450 ind.**
Monterey pine	32 ind.	32 ind.	150 ind.	0	32 ind.	59 ind.	**305 ind.**
Eastwood's goldenbush	0	0	1 ind.	0	6 ind.	1 ind.	**8 ind.**
Monterey ceanothus	9 ind.	1 ind.	0	0	8 ind.	0	**18 ind.**
small-leaved lomatium	0	0	32 ind.	0	16 ind.	1 ind.	**49 ind.**
Monterey spineflower	0	0	136 ind.	0	141 ind.	225 ind.	**502 ind.**
Yadon's piperia	53 ind.	3 ind.	59 ind.	41 ind.	0	0	**156 ind.**

6.1.2.1 SANDMAT MANZANITA

Sandmat manzanita is a CNPS Rank 1B.2 plant that is wide spread on the airport property. It occurs in all the Alternative 1 project study areas. Construction of the Proposed Project components would result in the removal of the sandmat manzanita individuals located in the disturbance areas. Table 8 provides the estimated numbers of individuals that could be removed by each of the Alternative 1 project components. In total, the Alternative 1 project components have the potential to remove 1,450 sandmat manzanita plants. The following list provides the quantity and location of the anticipated sandmat manzanita removals. Measures BIO-2 and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts on sandmat manzanita.

- **Terminal Area:** Approximately 152 sandmat manzanita plants would be removed during the construction of the new airport terminal and associated aircraft ramp. The individuals to be removed are in the ruderal vegetation that currently exists just north of the existing GA hangars, in the ruderal vegetation located adjacent to the existing ARFF station, and in the Monterey pine forest located on the bank that is immediately south of the GA ramp and hangars.
- **Parking and Circulation:** Approximately 44 sandmat manzanita plants would be removed during the construction of parking and circulation improvements that would occur on the southside of the airport.
- **Highway 68 Frontage Road Cul-de-sac:** Approximately 136 sandmat manzanita plants would be removed during the construction of the new Highway 68 Frontage Road Cul-de-Sac. All these impacts would occur in the Monterey pine forest and sandmat manzanita chaparral that are in the undeveloped parcel that is between the Fenton Keller and Robert Talbott properties.
- **Drainage Improvements:** Approximately 15 sandmat manzanita plants would be removed during the construction of the drainage improvements that would occur on the southside of the airport at the Highway 68 and Olmstead Road intersection.
- **North Access Road and General Aviation Relocation:** Approximately 742 sandmat manzanitas would be removed during construction of the proposed north access road (716 individuals) and GA Relocation area (26 individuals). The proposed north access road would traverse the hillside just east of the runways and the undeveloped lands located just north of the AOA. This area supports dense sandmat manzanita chaparral and coast live oak woodland. The GA study area supports ruderal vegetation with sparse sandmat manzanita occurrences.
- **Soil Deposition Areas:** The soil stockpiles would remove approximately 361 sandmat manzanita plants, most of which are in the largest of the stockpile areas. Construction of the proposed airport terminal would require excavating and stockpiling large amounts of soil. The excavated soil would be stockpiled in five soil deposition areas on the northern part of the airport property.

6.1.2.2 MONTEREY PINE

Monterey pine is a CNPS Rank 1B.1 plant that is widespread on the airport property. It occurs in all the Alternative 1 study areas, with the exception of the Drainage Improvement area. Construction of the Alternative 1 components would result in the direct removal of the Monterey pines in the disturbance areas. Table 8 above provides the estimated numbers of individuals that could be removed by each of the Alternative 1 components. In total, the Alternative 1 components have the potential to remove 305 Monterey pine. The following discusses the quantity and location of the Monterey pine removals.

- **Terminal Area:** 32 Monterey pine trees would be removed during the construction of the new airport terminal and associated aircraft ramp. The individuals to be removed are in the Monterey pine forest located on the bank that is immediately south of the existing GA ramp and hangars.
- **Parking and Circulation:** 32 Monterey pine trees would be removed during the construction of parking and circulation improvements that would occur on the south side of the airport. These individuals would be removed for the proposed traffic circle at Olmstead Road and Garden Road and the proposed surface parking.
- **Highway 68 Frontage Road Cul-de-sac:** 150 Monterey pine trees would be removed during construction of the new Highway 68 Frontage Road Cul-de-Sac. These impacts would occur in the ruderal habitat located between the existing airport parking and Highway 68 and in the Monterey pine forest and sandmat manzanita chaparral that are in the undeveloped parcel that is between the Fenton Keller and Robert Talbott properties.

- **North Access Road and General Aviation Relocation:** 32 Monterey pine trees would be removed during construction of the north access road. The north access road would traverse the hillside just east of the runways and the undeveloped lands located north of the AOA. These areas support dense sandmat manzanita chaparral and coast live oak woodland that harbor sporadic Monterey pines.
- **Soil Deposition Areas:** Construction of the proposed airport terminal would require excavating and stockpiling large amounts of soil. The excavated soil would be stockpiled in five soil deposition areas on the northern part of the airport property. The soil stockpiles would remove 59 Monterey pine trees. Most of this impact would occur in the largest stockpile area that would be in the coast live oak woodland, Monterey pine forest, sandmat manzanita chaparral, and ruderal habitats that are immediately north of the existing industrial lease areas on the airport located north of Airport Road.

6.1.2.3 EASTWOOD'S GOLDENBUSH

Eastwood's goldenbush is a CNPS Rank 1B.1 species that has sporadic occurrences on the airport property, with the highest concentrations in the northeast part of the property. This species was observed in the Parking and Circulation, Highway 68 Frontage Road Cul-de-Sac, North Access Road, and Soil Deposition study areas. Alternative 1 would remove one occurrence from the Highway 68 Frontage Road Cul-de-Sac study area, one occurrence from the Soil Deposition study area, and six occurrences from the North Access Road study area. The individuals near the intersection of Olmstead Road and Garden Road are located outside of the anticipated Alternative 1 Parking and Circulation study area would be avoided. Measures BIO-4 and BIO-13 through BIO-23 are recommended to address the Alternative 1 impacts on Eastwood's goldenbush.

6.1.2.4 MONTEREY CEANOTHUS

Monterey ceanothus is a CNPS Rank 4.2 species that was observed in the Parking and Circulation, North Access Road, and Terminal study areas. Alternative 1 would remove one occurrence from the Parking and Circulation study area, nine occurrences from the Terminal study area, and eight occurrences from the North Access Road study area. Measures BIO-5 and BIO-13 through BIO-23 are recommended to address the Alternative 1 impacts on Monterey ceanothus.

6.1.2.5 SMALL-LEAVED LOMATIUM

Small-leaved lomatium is a CNPS Rank 4.2 species that was observed in the Highway 68 Frontage Road Cul-de-Sac, North Access Road and GA Relocation, and Soil Deposition study areas. Alternative 1 would remove one occurrence from the Soil Deposition study area, 16 occurrences from the North Access Road and GA Relocation study area, and 32 occurrences from the Highway 68 Frontage Road Cul-de-Sac study area. The individuals near the intersection of Olmstead Road and Garden Road are located outside of the anticipated Alternative 1 Parking and Circulation study area would be avoided. Measures BIO-6 and BIO-13 through BIO-23 are recommended to address the Alternative 1 impacts to small-leaved lomatium.

6.1.2.6 MONTEREY SPINEFLOWER

Monterey spineflower is a federally threatened and CNPS Rank 1B.2 species that is widespread on the airport property. The Monterey spineflower population on the airport fluctuates seasonally making it difficult to predict the potential impacts to the species that could occur from future projects. Based on the Alternative 1 design and the 2016 and 2017 survey data, it is anticipated that Alternative 1 could impact approximately 502 individuals and the seed bank at the occurrences. The anticipated impacts would occur in the Highway 68 Frontage Road Cul-de-Sac, North Access Road and GA Relocation, and Soil

Deposition study areas. The impacts would include the removal of individuals, loss of soil seed bank from removing top soil, and the conversion of available habitat to developed areas. Measures BIO-7 and BIO-13 through BIO-23 are recommended to address the Alternative 1 impacts on Monterey spineflower.

6.1.2.7 YADON'S PIPERIA

Yadon's piperia is a federally endangered and CNPS Rank 1B.1 species that has numerous occurrences on the southern portion of the airport and sparse occurrences in the northern portion of the airport. Yadon's piperia was observed in the Terminal, Parking and Circulation, Highway 68 Frontage Road Cul-de-Sac, and Drainage Improvement study areas. As designed, Alternative 1 would directly remove 156 Yadon's piperia from these study areas. Alternative 1 has the potential to remove approximately 13% of the Yadon's piperia population that occurs on the airport property and the Fenton Keller property, and the loss of approximately 5% of the larger population occurring on and around the airport. Alternative 1 would permanently remove approximately 1.61 acres of occupied Yadon's piperia habitat. The impacts would include the physical removal of individuals, loss of soil seed bank from removing top soil, and the conversion of occupied habitat to developed areas. Measures BIO-8, BIO-9, and BIO-13 through BIO-23 are recommended to address the Alternative 1 impacts on Yadon's piperia.

6.1.2.8 SEASIDE BIRD'S BEAK

Seaside bird's beak is listed as endangered under the CESA and is a CNPS Rank 1B.1 species. The 2016 and 2017 surveys documented the presence of two (one in 2016 and one in 2017) individuals in the Alternative 1 Highway 68 Frontage Road Cul-de-Sac study area. Utilizing the survey data, the Airport redesigned the frontage road cul-de-sac alignment to avoid the known occurrences. As currently designed, the Alternative 1 frontage road would be constructed approximately 25 feet to the north of the occurrences. Seaside bird's beak is an annual species. As such, it's population numbers and exact location can fluctuate from season to season. Measures BIO-10 and BIO-13 through BIO-23 are recommended to address the Proposed Project's impacts on seaside bird's beak.

6.1.2.9 CALIFORNIA LEGLESS LIZARDS

The vegetative communities in the Alternative 1 study areas provide suitable habitat for silvery and black legless lizards and other reptile species. Grading activities could result in direct take of these reptiles. Direct take may include being struck by equipment, entrapped in stockpiled materials or trenches, or trampled or collected by construction personnel. Measures BIO-12 through BIO-23 are recommended to reduce the potential impacts to California legless lizards.

6.1.2.10 NESTING BIRDS

The habitats occurring in the Alternative 1 study areas provide suitable nesting habitat for birds. Common passerines may use the oak woodland and maritime chaparral for nesting; raptors may use the oak and pine trees for nesting. These available nesting habitats would be impacted by land-clearing activities. If land-clearing activities are conducted between March and September, birds may be nesting within or adjacent to the affected area(s) and the individuals could be directly or indirectly impacted. Direct impacts may include loss of active nests during vegetation removal. Noise or other disturbances may cause an individual to abandon a nest resulting in an indirect impact. Minimization measure BIO-11 is recommended to avoid the potential impacts to nesting birds.

6.1.3 Threshold 1 Proposed Project and Alternative 1 Compared Impacts

Differences between the two project alternatives resulted in variations of impacts to special-status species in the study areas. Table 9 summarizes the differences and/or similarities of the anticipated impacts to special-status species between the Proposed Project and Alternative 1.

Table 9. Comparison of Alternative Impacts

Resource	Proposed Project Impact	Alternative 1 Impact	Reason for Variance
sandmat manzanita	1,518 Individuals	1,450 Individuals	Exclusion of surface parking at Olmstead Road and Fred Kane Drive avoided impacts in the Alternative 1 Parking and Circulation study area. Exclusion of the loop in the Proposed Project frontage road reduced the impact area in the Frontage Road Loop and Terminal study areas.
Monterey pine	323 Individuals	305 Individuals	Exclusion of surface parking at Olmstead Road and Fred Kane Drive avoided impacts in the Alternative 1 Parking and Circulation study area. Exclusion of the loop in the Proposed Project frontage road reduced the impact area in the Frontage Road Loop and Terminal study areas.
Eastwood's goldenbush	8 Individuals	8 Individuals	No Change
Monterey ceanothus	18 Individuals	18 Individuals	No Change
small-leaved lomatium	49 Individuals	49 Individuals	No Change
Monterey spineflower	539 Individuals	502 Individuals	Exclusion of surface parking at Olmstead Road and Fred Kane Drive avoided impacts in the Alternative 1 Parking and Circulation study area
Yadon's piperia	460 Individuals	156 Individuals	Exclusion of the loop in the Proposed Project frontage road reduced the impact area in the Frontage Road Loop study area. Exclusion of the parking structure from the Proposed Project reduced the impact in the Proposed Project Parking and Circulation study area.

6.2 Threshold #2: Riparian Habitat or Sensitive Natural Community

The Proposed Project and Alternative 1 study areas do not support riparian habitats. However, the Proposed Project and Alternative 1 do support sandmat manzanita chaparral, Monterey pine forest, and coast live oak woodland, which the CDFW considers to be Sensitive Natural Communities. CDFW maintains a list of Sensitive Natural Communities that are evaluated using the NatureServe Heritage Methodology to assign Global and State rankings to the communities (NatureServe 2018). Natural Communities with ranks of "S1" through "S3" are considered Sensitive Natural Communities to be addressed in the environmental review processes of CEQA and its equivalents. The Global and State ranking system does not imply that specific actions are required in review of projects that may impact the community; however, regulatory agencies may request that impacts to these communities be addressed in environmental documents.

Sandmat manzanita chaparral and Monterey pine forest have "G1" Global Rank and an "S1" State Rank, which indicate that these communities are "critically imperiled." Coast live oak woodland has a "G4"

Global Rank and an "S4" State Rank, which indicate that coast live oak woodland is "apparently secure" in its range (Nature Serve 2018).

Oak woodlands are also considered under SB 1334 and associated PRC Section 21083.4, which maintains that the potential conversion of oak woodland is subject to CEQA and is to be mitigated. The following sections discuss the Proposed Project's and Alternative 1 potential impacts to the sensitive natural communities including oak woodlands.

6.2.1 Proposed Project

The Proposed Project could result in direct and indirect effects on sandmat manzanita chaparral, Monterey pine forest, and coast live oak woodland. Direct impacts could include the removal of the communities and conversion of the lands to developed areas. Indirect effects include erosion, accidental grading or equipment maneuvering, and spread of nonnative species that may negatively affect the natural processes that support the communities. Measures BIO-13 through BIO-22 are recommended to address impacts to sensitive natural communities and the flora and fauna that occupy the communities.

The Proposed Project would impact 4.21 acres of sandmat manzanita chaparral. This impact would result from the grading and development of the Proposed Highway 68 Frontage Road with Loop (0.53 acre), North Access Road and GA Relocation (3.26 acres), and the Soil Deposition Area (0.41 acre).

The Proposed Project would impact 5.27 acres of Monterey pine forest. This impact would result from the grading and development of the Terminal Area (1.16 acres), Proposed Parking and Circulation Area (1.09 acres), Proposed Highway 68 Frontage Road with Loop (1.94 acres), Proposed Drainage Improvements (0.45 acre), North Access Road and GA Relocation (0.36 acre), and the Soil Deposition Area (0.27 acre).

The Proposed Project would impact 4.83 acres of coast live oak woodland and 705 coast live oak trees. This impact would result from the grading and development of the North Access Road and GA Relocation (1.77 acres, 128 trees), the Soil Deposition (3.06 acres, 428 trees), Highway 68 Frontage Road Loop (83 trees), and the Parking and Circulation (66 trees) project components.

6.2.2 Alternative 1

Alternative 1 would impact 4.16 acres of sandmat manzanita chaparral. This impact would result from the grading and development of the Highway 68 Frontage Road with Cul-de-Sac (0.49 acre), North Access Road (3.26 acres), and the Soil Deposition Area (0.41 acre).

Alternative 1 would impact 4.54 acres of Monterey pine forest. This impact would result from the grading and development of the Terminal Area (1.16 acres), Parking and Circulation Area (0.71 acre), Highway 68 Frontage Road with Cul-de-Sac (1.73 acres), Drainage Improvements (0.31 acre), North Access Road (0.36 acre), and the Soil Deposition Area (0.27 acre).

Alternative 1 would impact 4.83 acres of coast live oak woodland and 657 coast live oak trees. This impact would result from the grading and development of the North Access Road and GA Relocation (1.77 acres, 128 trees), the Soil Deposition (3.06 acres, 428 trees), Highway 68 Frontage Road Loop (66 trees), and the Parking and Circulation (35 trees) project components.

6.3 Threshold #3: Wetlands

The Proposed Project and Alternative 1 study areas do not contain jurisdictional wetlands or other waters; therefore, impacts to jurisdictional wetlands or other waters are not expected.

6.4 Threshold #4: Movement of Resident or Migratory Species

The AOA on the airport property is fenced per FAA safety requirements. Portions of the airport property that are not included in the AOA are surrounded by existing development. The existing perimeter fence and development in the area limits the use of the airport property as a migratory route for resident wildlife species. However, common wildlife species such as California mule deer (*Odocoileus hemionus californicus*) and coyote (*Canis latrans*) use the undeveloped portions of the airport property for foraging and shelter. Although the Proposed Project and Alternative 1 project components may reduce the available foraging and shelter area for resident deer and coyote, implementation of the project components is not expected to significantly disrupt a migratory corridor.

6.5 Threshold #5: Local Policies or Ordinances Regarding Biological Resources

Those aspects of the Proposed Project and Alternative 1 that are in the City of Monterey (City) jurisdiction are subject to Chapter 37 Preservation of Trees and Shrubs of the City Code. Specifically, Section 37-2.5 Protection of Trees During Construction, Section 37-8 Removal or Damaging Trees on Private Property; Permit Required, and Section 37-11 Conditions of Removal/Mitigation Measures of the City Code. The following sections discuss the potential impacts to trees of various species in relation to the City Code.

In addition to impacts to trees, the Proposed Project and Alternative 1 components that are in the City jurisdiction have the potential to impact vegetation types identified for protection in the City of Monterey Conservation Element goals and policies. The goals and policies listed below are pertinent to the Proposed Project and Alternative 1 components that would occur in the City jurisdiction.

- **Goal d.** Protect the character and composition of existing native vegetative communities. Conserve, manage, and restore habitats for endangered species, and protect biological diversity represented by special-status plant and wildlife species.
    - **Policy d.1.** Protect existing native plants and promote the use of locally occurring, native vegetation for public and private landscaping and revegetation efforts.
    - **Policy d.2.** Discourage the use of plant species on the California Exotic Pest Plant Council lists.
    - **Policy d.3.** Protect existing sensitive habitats by careful planning to avoid and/or mitigate significant impacts to habitat areas identified as having high and moderate biological values.
    - **Policy d.4.** Protect and manage habitats that support special-status species, are of high biological diversity, or are unusual or regionally restricted. Prepare biotic reports or habitat management plans as needed to ensure protection of habitat values.
    - **Policy d.5.** Reduce biotic impacts to a less-than-significant level on project sites by ensuring that mitigation measures identified in biotic reports are incorporated as conditions of approval for development projects. Compliance with the City Tree Ordinance is the mechanism that will be used to address impacts of tree removals. As mitigation for significant impacts, avoidance, replacement, restoration of habitats on- or off-site or other measures may be required.
    - **Policy d.6.** Within identified habitat areas with high biological value, the City will provide for a focused evaluation of areas identified as appropriate habitat for special-status species during the project review and approval process.

6.5.1 Proposed Project

6.5.1.1 TREES WITHIN CITY OF MONTEREY JURISDICTION

The Proposed Project includes the Highway 68 Frontage Road Loop and Parking and Circulation components that would occur within City jurisdiction. These Proposed Project components would result in the removal of 306 trees of the following species:

- coast live oak: 117 trees
- Monterey pine: 179 trees
- Monterey cypress: six trees
- golden wattle (*Acacia pycnantha*): four trees

None of the trees that would be removed have been designated as a "Local Landmark Tree" by the City. Measure BIO-25 is recommended to offset the Proposed Project's potential impact to trees within City jurisdiction.

6.5.1.2 CITY OF MONTEREY CONSERVATION ELEMENT GOALS AND POLICIES REGARDING BIOLOGICAL RESOURCES

The Frontage Road Loop and Parking and Circulation components of the Proposed Project would result in the removal of native habitats that are provided special considerations under the City of Monterey Conservation Element goals and policies. The following list identifies the Proposed Project's potential inconsistencies with the City of Monterey Conservation Element. Measures BIO-23 and BIO-24 are recommended to address these inconsistencies.

- **Policy d.1:** The Highway 68 Frontage Road Loop and the Parking and Circulation components of the Proposed Project would result in the removal of native plants that comprise native plant communities.
- **Policy d.3:** The Highway 68 Frontage Road Loop and the Parking and Circulation components of the Proposed Project would result in the removal of 2.76 acres of Monterey pine forest and 0.53 acres of sandmat manzanita chaparral plant communities. These plant communities are considered Sensitive Natural Communities by the CDFW. The portions of these communities that occur in the Proposed Project study areas are partially disturbed but largely intact, therefore have moderate to high biological values.
- **Policy d.4:** The Highway 68 Frontage Road Loop and the Parking and Circulation components of the Proposed Project would result in the removal of plant communities that contain Yadon's piperia, Monterey spineflower, Seaside bird's beak, sandmat manzanita, and Eastwood's goldenbush. Yadon's piperia and Monterey spineflower are listed under the FESA; seaside bird's beak is listed under the CESA. All the plant species are ranked as rare species by the CNPS and are protected under the NPPA. These plant species and their associated plant communities are regionally restricted to the Monterey area and of high biological diversity.

6.5.2 Alternative 1

6.5.2.1 TREES WITHIN CITY OF MONTEREY JURISDICTION

Alternative 1 includes the Highway 68 Frontage Road Cul-de-Sac and Parking and Circulation components that would occur within City jurisdiction. These Alternative 1 components would result in the removal of 252 trees of the following species:

- coast live oak: 67 trees
- Monterey pine: 164 trees
- Monterey cypress: 17 trees
- golden wattle: four trees

None of the trees that would be removed have been designated as a "Local Landmark Tree" by the City. Measure BIO-26 is recommended to offset Alternative 1's potential impact to trees within City jurisdiction.

6.5.2.2 CITY OF MONTEREY CONSERVATION ELEMENT GOALS AND POLICIES REGARDING BIOLOGICAL RESOURCES

The Frontage Road Cul-de-Sac and Parking and Circulation components of Alternative 1 would result in the removal of native habitats that are provided special considerations under the City of Monterey Conservation Element goals and policies. The following list identifies Alternative 1's potential inconsistencies with the City of Monterey Conservation Element. Measures BIO-23 and BIO-24 are recommended to address these inconsistencies.

- **Policy d.1:** The Highway 68 Frontage Road Cul-de-Sac and the Parking and Circulation components of Alternative 1 would result in the removal of native plants that comprise native plant communities.
- **Policy d.3:** The Highway 68 Frontage Road Cul-de-Sac and the Parking and Circulation components of Alternative 1 would result in the removal of 2.24 acres of Monterey pine forest and 0.48 acres of sandmat manzanita chaparral plant communities. These plant communities are considered Sensitive Natural Communities by the CDFW. The portions of these communities that occur in the Alternative 1 study areas are partially disturbed but largely intact, therefore have moderate to high biological values.
- **Policy d.4:** The Highway 68 Frontage Road Cul-de-Sac and the Parking and Circulation components of Alternative 1 would result in the removal of plant communities that contain Yadon's piperia, Monterey spineflower, Seaside bird's beak, sandmat manzanita, and Eastwood's goldenbush. Yadon's piperia and Monterey spineflower are listed under the FESA; seaside bird's beak is listed under the CESA. All the plant species are ranked as rare species by the CNPS and are protected under the NPPA. These plant species and their associated plant communities are regionally restricted to the Monterey area and of high biological diversity.

6.6 Threshold #6: Conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other Conservation Plan

In 2015, the Airport completed the construction of the RSA Project. The EIR for the RSA Project identified impacts to sandmat manzanita chaparral, coast live oak woodland, and rare plants that occurred in the affected communities. As part of the mitigation for these impacts, the Airport developed and adopted a Habitat Conservation and Enhancement Plan (HCEP) that established three conservation areas on the eastern part of the airport property. Conservation Area 1 includes 1.2 acres of central maritime chaparral that is dominated by sandmat manzanita, Conservation Area 2 includes 3.0 acres of coast live oak woodland, and Conservation Area 3 includes 1.2 acres of maritime chaparral restoration plantings within the vegetated Engineered Material Arresting System retaining walls and adjacent areas. The Airport designated these areas as open space on the Airport Layout Plan and have been conducting habitat management activities in these areas. The Proposed Project and Alternative 1 include the North Access Road component that would remove 0.79 acre of Conservation Area 1 (sandmat manzanita chaparral) and 0.46 acre of Conservation Area 2 (coast live oak woodland). The removal of these established conservation areas conflicts with the approved mitigation for the RSA Project. As such, the Airport should replace the affected conservation areas to maintain compliance with the RSA Project's established mitigation. Measures BIO-27 and BIO-28 are recommended to replace the affected portions of the RSA Project mitigation areas.

7 SHORT-TERM PROJECTS MITIGATION

7.1 Threshold #1: Candidate, Sensitive, or Special-status Species

7.1.1 Sandmat Manzanita Proposed Project

BIO-1 The Project Sponsor shall propagate, plant, and maintain at least 3,036 sandmat manzanita container plants. The sandmat manzanita container plants may be installed in the temporary disturbance areas and/or landscaping of the Proposed Project North Access Road, the onsite Conservation Area 4 (Figure 6), or the offsite conservation lands (see BIO-20 through BIO-22; Figure 6) as appropriate. The sandmat manzanita container plants shall be monitored and maintained for 7 years following installation. In order for the sandmat manzanita replacement mitigation to be considered successful, at least 3,036 replacement sandmat manzanita plants must be self-sustaining by the end of the 7-year monitoring program.

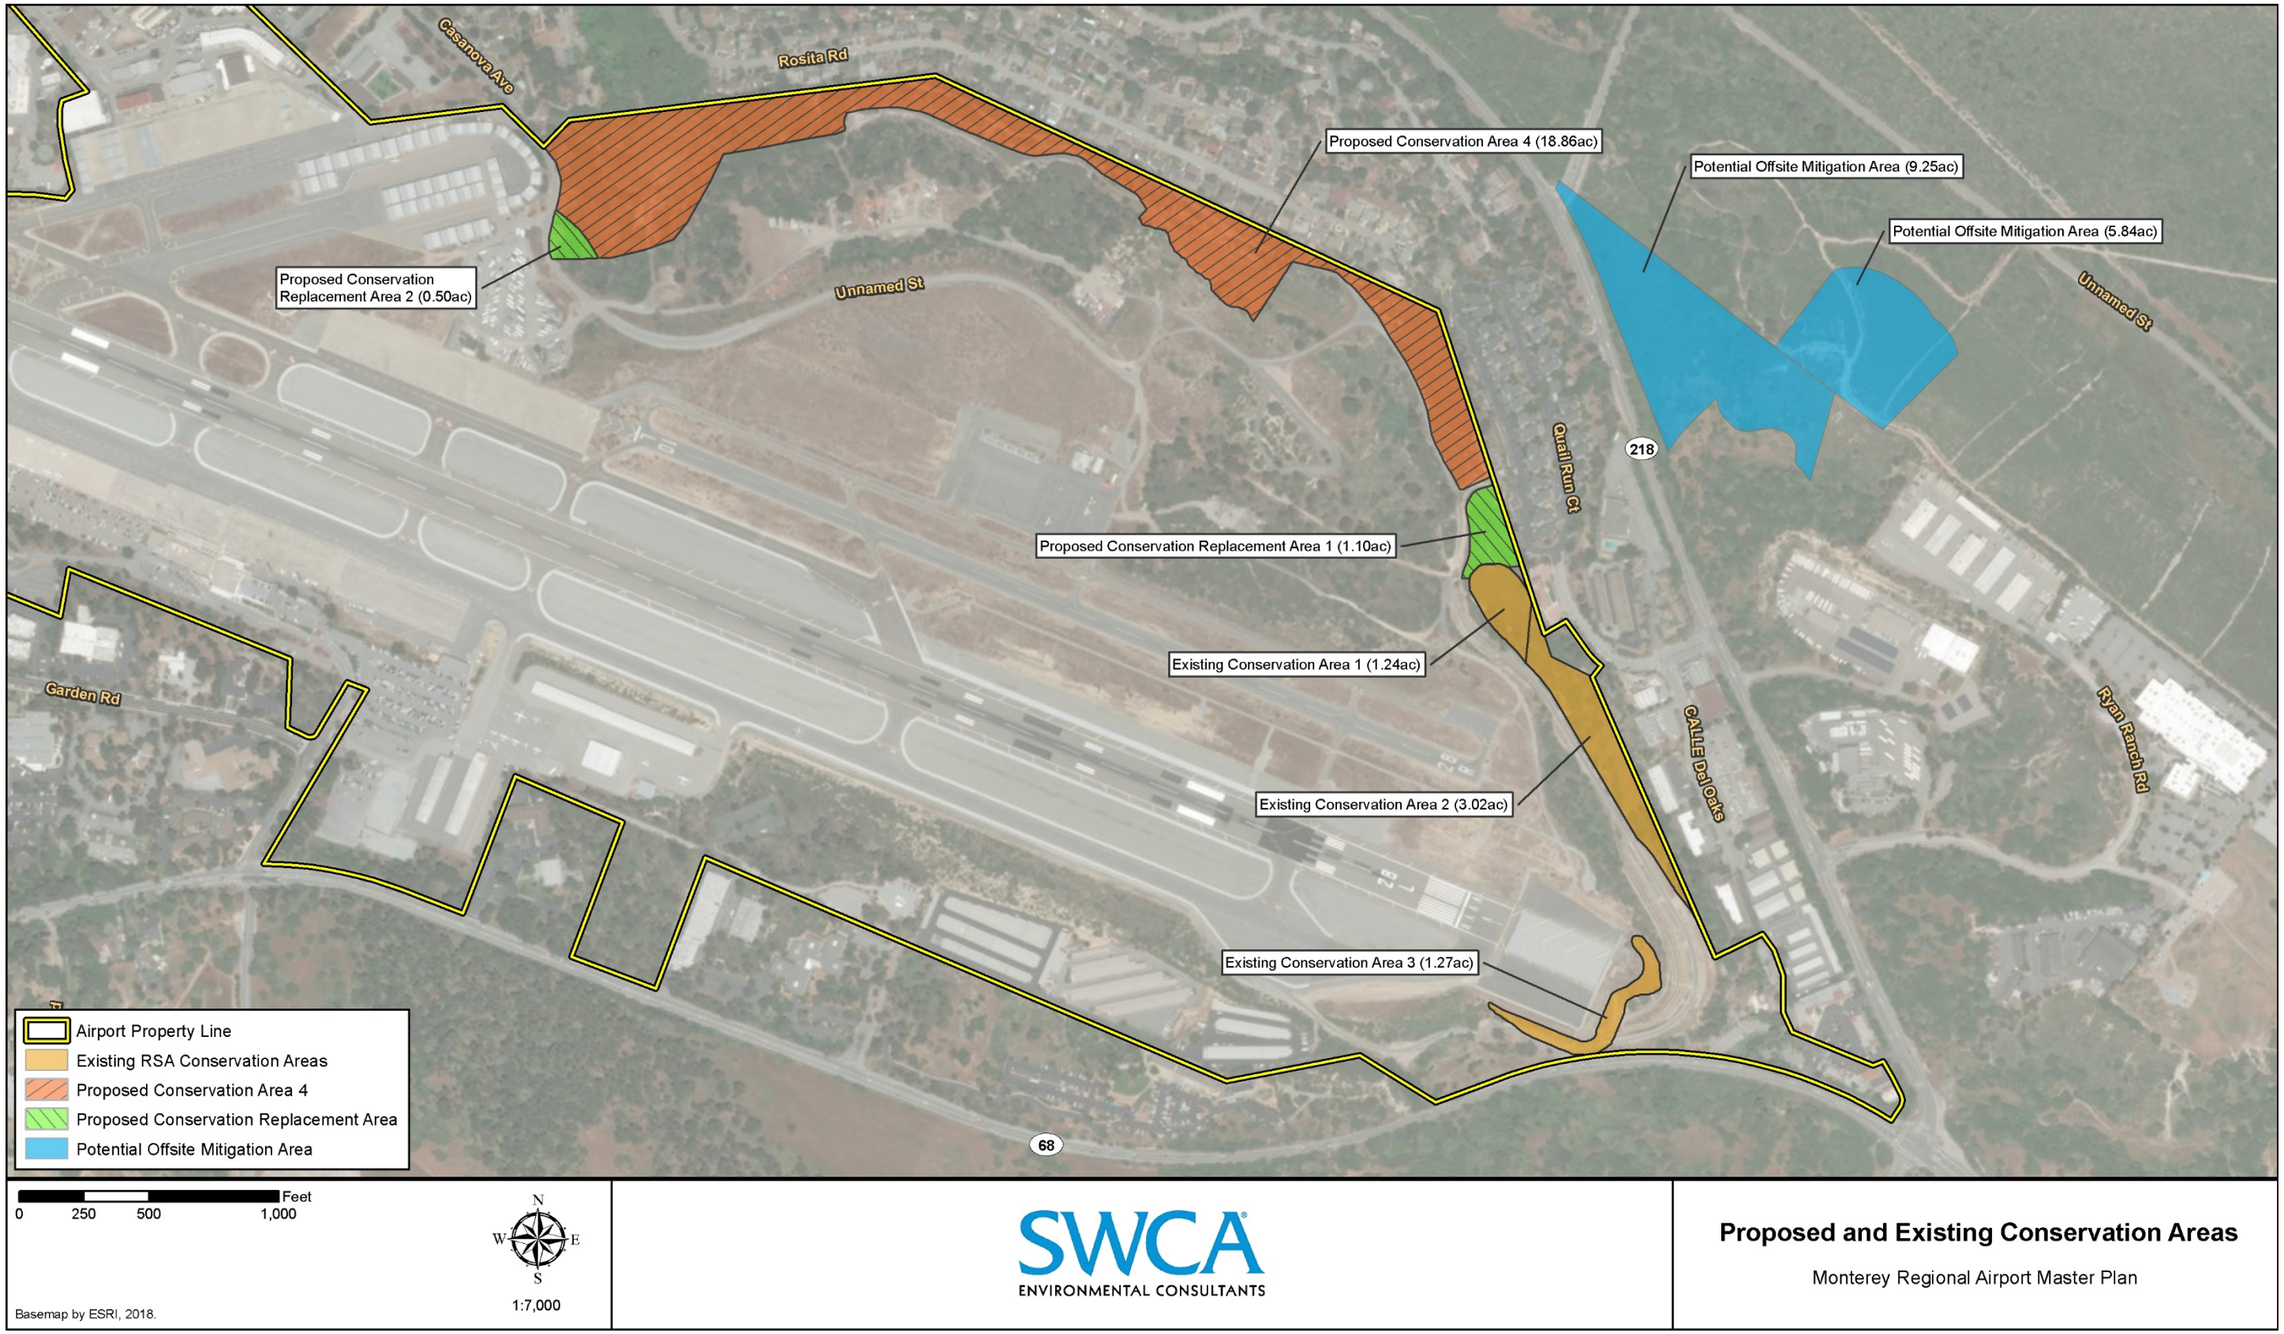

Figure 6. Proposed and existing conservation areas.

This page intentionally left blank.

7.1.2 Sandmat Manzanita Alternative 1

BIO-2 The Project Sponsor shall propagate, plant, and maintain at least 2,900 sandmat manzanita container plants. The sandmat manzanita container plants may be installed in the temporary disturbance areas and/or landscaping of the Alternative 1 North Access Road, the onsite Conservation Area 4 (see Figure 6), or the offsite conservation lands (see BIO-20 through BIO-22; Figure 6) as appropriate. The sandmat manzanita container plants shall be monitored and maintained for 7 years following installation. To consider the sandmat manzanita replacement mitigation successful, at least 2,900 replacement sandmat manzanita plants must be self-sustaining by the end of the 7-year monitoring program.

7.1.3 Monterey Pine Proposed Project and Alternative 1

Monterey pine and other tall tree species are problematic to safe aircraft operations at airports. Tall trees in the approach/departure flight path or adjacent to the runways often impede pilot's sight barriers. The FAA has established sight line restrictions on public use airports to reduce sight impediments (FAR Part 77, Obstructions to Navigation). These restrictions require the Airport and other airport operators to remove trees and other objects that impede pilot's view of the airfield. Because of these restrictions, the Airport's ability to mitigate impacts to Monterey pine trees by planting more trees onsite is greatly limited. For past projects, the Airport has mitigated Monterey pine tree removals by replacing the removed trees at a 1.1:1 mitigation ratio. Applying this ratio to the Proposed Project would require the Airport to plant 356 Monterey pines (336 Monterey pines for Alternative 1) on the airport property. The FAA sight restrictions make this mitigation strategy infeasible for the Proposed Project and Alternative 1. As such, the following mitigation is recommended to offset the Monterey pine tree removals to the maximum extent feasible.

BIO-3 Prior to construction of any Proposed Project or Alternative 1 component that would remove Monterey pine trees, the Project Sponsor will establish 1.0 acre of Monterey pine forest conservation space on the north side of the airport property. The Airport will plant up to 25 Monterey pine trees in the conservation space. The 1.0 acre of Monterey pine forest conservation space will be managed under an HCEP as described in BIO-17 below.

7.1.4 Eastwood's Goldenbush Proposed Project and Alternative 1

BIO-4 Prior to any site disturbances, the Project Sponsor will retain a qualified biologist and/or horticulturalist to collect a sufficient amount of Eastwood's goldenbush seed from individuals on the airport property to propagate a minimum of 16 Eastwood's goldenbush container plants. The propagated materials will be planted and maintained in Conservation Area 4 (see Figure 6).

7.1.5 Monterey Ceanothus Proposed Project and Alternative 1

BIO-5 Prior to any site disturbances, the Project Sponsor will retain a qualified biologist and/or horticulturalist to collect a sufficient amount of Monterey ceanothus seed from individuals on the airport property to propagate a minimum of 36 Monterey ceanothus container plants. The propagated materials will be planted and maintained in Conservation Area 4 (see Figure 6).

7.1.6 Small-Leaved Lomatium Proposed Project and Alternative 1

BIO-6 To minimize impacts to small-leaved lomatium and promote the continued existence of the species on the airport property, the Project Sponsor will implement a soil and seed bank conservation program that will include small-leaved lomatium seed and top soil collection and distribution.

Small-leaved lomatium will be conserved in Conservation Area 4 by broadcast seeding and relocating the soil seed bank. Seed to be broadcast will be collected from the project areas prior to start of construction. This species flowers from January through June; therefore, seed collection would begin in May and continue through September, or when seed production ceases. To the extent feasible, all available seed would be collected from plants located in the project disturbance areas.

Soil from the project disturbance areas containing small-leaved lomatium seed would be collected and reapplied. To accomplish this, the upper 6 inches of soil located within the vicinity of existing small-leaved lomatium individuals will be collected and redistributed prior to grading activities. Soil collection would occur immediately following completion of seed collection and prior to the first rainfall. The collected soil should be immediately distributed in the disturbance areas. The collected seed would be broadcast over the relocated soil, and then the receptor site will be lightly raked to cover the seed.

7.1.7 Monterey Spineflower Proposed Project and Alternative 1

BIO-7 To minimize Monterey spineflower impacts and promote the continued existence of the species on the airport property, the Project Sponsor will implement a soil and seed bank conservation program that will include Monterey spineflower seed and top soil collection and distribution.

Monterey spineflower will be conserved in the temporarily impacted portions of the Proposed Project and/or Alternative 1 disturbance areas by broadcast seeding and relocating the soil seed bank. Seed to be broadcast will be collected from the project areas prior to start of construction. All seed collection activities will be conducted by a USFWS-approved biologist. This species flowers from April through June; therefore, seed collection would begin in August and continue through September, or when seed production ceases. To the extent feasible, all available seed would be collected from plants located in the project disturbance areas.

Soil from the project disturbance areas containing Monterey spineflower seed would be collected and reapplied. To accomplish this, the upper 6 inches of soil located within the vicinity of existing Monterey spineflower individuals will be collected and redistributed prior to grading activities. Soil collection would occur immediately following completion of seed collection and prior to the first rainfall. The collected soil should be immediately distributed in the disturbance areas that do not have existing Monterey spineflower occurrences. The collected seed would be broadcast over the relocated soil, and then the receptor site will be lightly raked to cover the seed.

7.1.8 Yadon's Piperia Proposed Project and Alternative 1

As stated in Sections 6.1.1.7 and 6.1.2.7, the Proposed Project and Alternative 1 have the potential to remove Yadon's piperia occurrences and convert occupied Yadon's piperia habitat to developed lands. The Airport should include the following minimization measures to reduce the anticipated impacts to Yadon's piperia. These measures are intended to address the Airport's responsibilities as a lead agency under CEQA. The measures may be subject to change during a FESA Section 7 consultation between the FAA and USFWS for any project component(s) that require FAA funding, approval, oversight, or other federal nexus.

BIO-8 If Alternative 1 and/or the Highway 68 Frontage Road Cul-de-Sac are implemented, the associated Surface Parking and Surface Parking Circulation Road(s) will be designed to be constructed on the existing asphalt to avoid impacts to the Yadon's piperia that are located on the Airport/Fenton Keller property boundary. If the Proposed Project and/or Highway 68 Frontage Road loop are implemented, the Yadon's piperia located on the Airport/Fenton Keller Property boundary would be removed and implementation of a 5-year Yadon's piperia seed and bulb collection and translocation program (Measure BIO-9) would be necessary in this location.

Prior to construction of the Surface Parking and associated Surface Parking Circulation Road(s), the construction plans shall clearly show the placement of construction exclusion fence along the toe of slope at the Airport/Fenton Keller property boundary. The intent of the fence is to exclude the Yadon's piperia occurrences from accidental disturbance during construction. The fence should be maintained in place throughout the construction period.

BIO-9 To minimize the impacts to Yadon's piperia, the Project Sponsor will retain a qualified biologist to design and implement a 5-year Yadon's piperia seed and bulb collection and translocation program. The seed and bulb translocation program will be prepared and approved for implementation by the Project Sponsor in the 2 years prior to construction of any Proposed Project or Alternative 1 component that would impact Yadon's piperia, including but not limited to construction of the new Terminal and associated aircraft ramp and the Highway 68 Frontage Road. The Yadon's piperia seed and bulb collection and translocation program should include the following:

- Detailed methods and a schedule for the collection and distribution of Yadon's piperia seed and the translocation of Yadon's piperia bulbs of individuals that are in the construction area(s).
- During the flowering/blooming period for Yadon's piperia (anticipated to be May–July) and in the year prior to project construction, a qualified biologist will mark with pin flags, individual Yadon's piperia plants that will be impacted by the project construction.
    - During the time that the marked Yadon's piperia are setting seed (anticipated to be between August and September), the biologist will collect seed from the marked individuals. The collected seed will be redistributed in a predetermined seed and bulb receiver site that is located adjacent to but outside of the disturbance area. Due to mycorrhizal associations, the seed and bulb receiver site must be near existing Yadon's piperia individuals.
        - Prior to distributing the collected seed in the receiver site, the receiver site will be cleared of nonnative vegetation.

  - Once the seed receiver site is prepared, the biologist will hand broadcast the seed in the receiver site, gently rake the seed into the duff/soil surface, and cover the seed with pine needle duff.
  - The seed and bulb receiver site and nearby Yadon's piperia occurrences will be fenced during construction to exclude the area from accidental damages during construction activities.

- Prior to construction and when plants are dormant (anticipated to be October–December), the biologist will excavate and relocate bulbs of the marked plants to the seed and bulb receiver site. The bulbs should be planted approximately 6 inches below the soil surface.
- Following completion of the seed and bulb relocation efforts, the biologist will monitor the receiver site for 4 consecutive years. The goal of the monitoring will be to quantify and document the number of individuals that emerged in the receiver site, the presence of non-native vegetation, and overall success of the translocation efforts.
- Nonnative vegetation removal must be conducted during the monitoring program. Nonnative vegetation removal may not utilize translocated herbicides due to root to tuber/bulb transfer.

7.1.9 Seaside Bird's Beak Proposed Project and Alternative 1

As stated in Sections 6.1.1.8 and 6.1.2.8 the Proposed Project Highway 68 Frontage Road Cul-de-Sac and Alternative 1 Highway 68 Frontage Road Cul-de-Sac would be constructed adjacent to seaside bird's beak occurrences. The following avoidance measures are proposed to facilitate avoidance of the occurrences.

BIO-10 To account for Seaside bird's beak seasonal population fluctuations and facilitate species avoidance, the Project Sponsor will conduct annual surveys for seaside bird's beak in the Airport-owned parcel located between the Fenton Keller and Robert Talbott properties. The annual seaside bird's beak survey will be conducted in June, July, or August of each year preceding the final design and development of the chosen Highway 68 Frontage Road alternative. The intent of the annual survey effort is to collect GPS data on the species' distribution and develop a multi-season assessment of the quantity and distribution of the seaside bird's beak occurrences near the Highway 68 Frontage Road alignment. The annual survey GPS data will be provided to the Airport so that the Airport's project design team can use the survey data during the development of the final design plans to align the proposed road in such a manner that avoids impacts to the seaside bird's beak.

If full avoidance of the seaside bird's beak is feasible, the project contractors, under the direction of an environmental monitor, will install construction exclusion fencing around the occurrences to exclude construction-related disturbances from the area. If the Airport's design team determines that full avoidance of the species is not feasible, the Project Sponsor will delay construction of the Highway 68 Frontage Road until they have coordinated with the CDFW to obtain a CESA Section 2081 Incidental Take Permit for seaside bird's beak.

7.1.10 Nesting Birds Proposed Project and Alternative 1

BIO-11 To the maximum extent possible, initial vegetation-clearing activities in the project areas should be conducted between October and February, which is outside of the typical bird breeding season. If the project schedule does not provide for late season vegetation removal,

a nesting bird survey will be conducted by a qualified biologist no more than 1 week prior to the land clearing to determine presence/absence of nesting birds within the vegetated area. If active nests are observed, work activities will be avoided within 100 feet of the active nest(s) until young birds have fledged and left the nest. The nests shall be monitored weekly by a biologist having experience with nesting birds to determine when the nest(s) become inactive. The buffer may be reduced but not eliminated during active nesting if deemed appropriate by the biologist. Readily visible exclusion zones will be established in areas where nests must be avoided. The Airport and the appropriate regulatory agency will be contacted if any federally or state-listed bird species are observed during surveys. Nests, eggs, or young of birds covered by the MBTA and CFGC will not be moved or disturbed until the young have fledged.

7.1.11 California Legless Lizard Proposed Project and Alternative 1

BIO-12 Within 30 days prior to site grading, the environmental monitor shall conduct surveys for California legless lizards and other reptiles. The surveyor should utilize hand search or cover board methods in areas of disturbance where legless lizards are expected to be found (e.g., under shrubs, other vegetation, or debris). If cover board methods are used, they should commence at least 30 days prior to the start of construction. If hand search methods are used, the surveys should be completed immediately prior to and during grading activities. The surveyor should capture and relocate any legless lizards or other reptiles observed during the survey effort. The captured individuals should be relocated from the construction area(s) and placed in suitable habitat on the airport property.

7.2 Threshold #2: Riparian Habitat or Sensitive Natural Community

7.2.1 Proposed Project and Alternative 1

BIO-13 Prior to ground disturbance, the Project Sponsor shall retain an environmental monitor for all measures requiring environmental mitigation to ensure compliance with the EIR mitigation measures. The monitor shall be responsible for: (1) ensuring that procedures for verifying compliance with environmental mitigations are implemented; (2) establishing lines of communication and reporting methods; (3) conducting daily and weekly compliance reporting; (4) conducting construction crew training regarding environmentally sensitive areas; (5) maintaining authority to stop work; and (6) outlining actions to be taken in the event of non-compliance. Monitoring shall be at a frequency and duration determined by the Project Sponsor and in consultation with the affected natural resource agencies (e.g., CDFW, USFWS).

BIO-14 All grading plans shall clearly show the location of project delineation fencing that excludes adjacent sensitive communities from disturbance. The fencing shall consist of highly visible construction fence supported by steel T-stakes that are driven into the soil. The monitoring biologist shall field-fit the placement of the project delineation fencing to minimize impacts to adjacent communities and other sensitive resources. The project delineation fencing shall remain in place and functional throughout the duration of the project and no work activities shall occur outside the delineated work area. The grading plans shall clearly show all staging areas, which shall be located within the construction area and outside the adjacent habitat areas.

BIO-15 Prior to the commencement of site grading, the environmental monitor shall conduct an environmental awareness training for all construction personnel. The environmental awareness training shall include discussions of the special communities and special-status species that occur in the project area. Topics of discussion shall include: descriptions of the species' habitats; general provisions and protections afforded by the FESA and CEQA; measures implemented to protect special-status species; review of the project boundaries and special conditions; the monitor's role in project activities; lines of communication; and procedures to be implemented in the event a special-status species is observed in the work area.

BIO-16 The Project Sponsor shall prepare a detailed erosion control plan, which shall address both temporary and permanent measures to control erosion. Erosion and soil protection shall be provided on all cut-and-fill slopes and the soil deposition areas. The erosion control plan shall include revegetation measures including mulching, hydro-seeding, or planting methods as appropriate. All permanent erosion control measures shall be initiated as soon as possible after completion of grading, and prior to the onset of the rainy season (October 15). Permanent revegetation and landscaping shall emphasize native shrubs and trees, to improve the probability of slope and soil stabilization without adverse impacts to slope stability due to irrigation infiltration and long-term root development. Vegetation shall be watered regularly to ensure adequate root establishment.

BIO-17 Prior to implementation of any Proposed Project or Alternative 1 component, the Project Sponsor shall prepare an HCEP that designates an 18.86-acre conservation area (Conservation Area 4) along the airport's northern property boundary as Open Space on the Airport Layout Plan. The HCEP shall provide for the conservation and management of approximately 11.92 acres of coast live oak woodland, 5.92 acres of sandmat manzanita chaparral, and 1.0 acre of Monterey pine forest habitats. Figure 6 shows the location of Conservation Area 4 and its associated habitat types.

Future activities in Conservation Area 4 shall be limited to preserving and rehabilitating the oak woodland, sandmat manzanita, Monterey pine forest, and special-status plant species that occur in the conservation area. Habitat rehabilitation activities shall focus on removing invasive species; planting native coast live oak woodland, sandmat manzanita chaparral, and Monterey pine forest associates; and augmenting the native rare plant species populations.

The HCEP shall be prepared by a qualified biologist and/or botanist and shall detail the methods for managing the conservation area. At a minimum, the HCEP should include the following elements:

- A brief narrative of the project location, description, and purpose;
- Clearly identified parties responsible for the conservation program and their contact information;
- A map showing and quantifying all conservation areas;
- Designation of a Monterey spineflower seed and soil receiver site;
- A detailed discussion of the methods for implementing the HCEP including invasive species removal, sources of plant materials, and supplemental watering regimes;
- Methods for the identification and removal of diseased or dead trees;

- Detailed discussions of a special-status plant species propagation program. Special-status plant propagules shall be collected from the disturbance areas, grown, and reintroduced into the conservation areas;
- Identification of locations, amounts, sizes, and types of plants to be planted, inclusive of at least 100 coast live oak trees, 2,000 sandmat manzanita container plants, and 25 Monterey pine trees.
- Identification of necessary components (e.g., temporary irrigation, amendments, etc.) to ensure successful plant reestablishment;
- A program schedule and established success criteria for a 7-year monitoring and reporting program that is structured to ensure the success of the HCEP; and
- Detailed discussions of the methods to be employed for implementing all additional habitat conservation requirements put forth by the USFWS and CDFW as appropriate.

BIO-18 The Project Sponsor shall retain a qualified biologist/botanist to supervise and monitor the implementation of the HCEP. The biologist/botanist should supervise plant propagation, site preparation, implementation timing, species utilized, planting installation, maintenance, monitoring, and reporting of the habitat rehabilitation efforts. The biologist/botanist shall prepare and submit six annual reports and one final monitoring report to the Airport and other agencies as appropriate. The annual and final monitoring reports should include discussions of the project activities, project photographs, and an assessment of the mitigation efforts' attainment of the success criteria.

BIO-19 The Project Sponsor shall include in the Proposed Project or Alternative 1 design plans the installation of a water supply and irrigation system. The system will supply water to temporary irrigation that will be used to provide supplemental water to Conservation Area 4. The water supply and temporary irrigation system shall be installed as part of the short-term project development and prior to the installation of plantings.

BIO-20 The Project Sponsor shall implement an offsite habitat conservation program that benefits local flora and fauna with emphasis on coast live oak woodland, maritime chaparral, and rare plant conservation. The conservation program shall be implemented on lands in the coastal Monterey area, preferably near the airport. The Project Sponsor is currently pursuing conservation lands located just east of the airport that support approximately 1.04 acres of annual brome grasslands, 2.55 acres of coast live oak woodland, 4.01 acres of arroyo willow thicket, 3.41 acres of chamise chaparral, and 4.08 acres of woollyleaf manzanita chaparral. Figure 6 shows the location of the potential offsite conservation lands. The potential conservation lands are located adjacent to an existing Native Rare Plant Reserve that was established by the USACE Installation-Wide Multispecies Habitat Management Plan for Former Fort Ord. Should the acquisition of the potential conservation lands not be completed, the Project Sponsor shall pursue the acquisition of other lands that support or have the potential to support coast live oak woodland and maritime chaparral communities. Once the offsite conservation lands are secured, the Project Sponsor shall place the lands under a conservation easement in perpetuity.

BIO-21 Upon acquisition of the offsite conservation lands, the Project Sponsor shall conduct a biological inventory of the conservation lands that includes floristic botanical surveys and wildlife surveys as appropriate. The intent of the biological inventory is to identify and

quantify the resources present on the conserved lands and provide a baseline for the implementation of a resource-focused conservation program.

BIO-22 The Project Sponsor shall prepare and implement a conservation program on the conserved lands. The conservation program shall utilize the biological inventory to develop management actions that focus on conserving, rehabilitating, and/or enhancing the biological resources present. At a minimum, the conservation program shall include:

- A brief narrative of the conservation lands location, description, and purpose;
- Clearly identified parties responsible for the conservation program and their contact information;
- Maps showing and quantifying all conservation areas, habitats, invasive species, native rare species, and suitable rehabilitation areas;
- Identification of suitable habitat rehabilitation plant species including rare plants to be installed for mitigation for future projects proposed by the Project Sponsor.
- A detailed discussion of the methods for implementing the conservation program including invasive species removal, installation and maintenance of plant materials, and supplemental watering regimes;
- Methods for the identification and removal of diseased or dead trees, as needed;
- Detailed discussions of a special-status plant species management;
- Identification of necessary components (e.g., temporary irrigation, amendments, etc.) to ensure successful plant reestablishment; and
- A program schedule for a 7-year monitoring and reporting program that is structured to ensure the successful management of the conserved lands.

7.3 Threshold #3: Wetlands

The Proposed Project and Alternative 1 are not expected to have impacts on jurisdictional wetlands or other waters; therefore, mitigation for jurisdictional waters are not recommended.

7.4 Threshold #4: Movement of Resident or Migratory Species

Significant effects on the movement of resident or migratory species are not expected to result from the Proposed Project or Alternative 1; therefore, mitigation for impacts on the movement of wildlife is not recommended.

7.5 Threshold #5: Local Policies or Ordinances Regarding Biological Resources

7.5.1 Proposed Project and Alternative 1

BIO-23 The Project Sponsor shall incorporate California native plant species in the landscape designs of the Proposed Project and Alternative 1 North Access Road, Highway 68 Frontage Road Loop, and Highway 68 Frontage Road Cul-de-Sac designs.

BIO-24 The Project Sponsor shall not utilize any plant species that are listed on the California Exotic Pest Plant Council lists in the landscape designs of any of the Proposed Project or Alternative 1 components.

7.5.2 Proposed Project

BIO-25 During the City of Monterey permitting process for the Highway 68 Frontage Road Loop and associated Parking and Circulation project components, the Project Sponsor shall coordinate with the City Forester to determine an appropriate in-lieu fee for the replacement of the 117 coast live trees, 179 Monterey pine trees, six Monterey cypress trees, and four golden wattle trees that would be removed. Per City Code 37-11(D), the in-lieu fee payment to the City of Monterey shall be equivalent to the value of the removed trees or the cost of the numbers of replacement trees as determined by City Council Resolution. The value of the trees shall be established and conform to standards adopted by City Council Resolution. The payment shall be used to plant additional trees offsite in a location approved by the City Forester.

7.5.3 Alternative 1

BIO-26 During the City of Monterey permitting process for the Highway 68 Frontage Road Cul-de-Sac and associated Parking and Circulation project components, the Project Sponsor shall coordinate with the City Forester to determine an appropriate in-lieu fee for the replacement of the 67 coast live trees, 164 Monterey pine trees, 17 Monterey cypress trees, and four golden wattle trees that would be removed. Per City Code 37-11(D), the in-lieu fee payment to the City of Monterey shall be equivalent to the value of the removed trees or the cost of the numbers of replacement trees as determined by City Council Resolution. The value of the trees shall be established and conform to standards adopted by City Council Resolution. The payment shall be used to plant additional trees off-site in a location approved by the City Forester.

7.6 Threshold #6: Conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other Conservation Plan

7.6.1 Proposed Project and Alternative 1

BIO-27 To replace the 0.79 acre of Conservation Area 1 (sandmat manzanita chaparral) that would be removed by the construction of the Proposed Project and Alternative 1 North Access Road, the Airport shall designate 1.1 acres of existing sandmat manzanita chaparral as open space on the Airport Layout Plan and manage the resource per the guidelines of the RSA Project

HCEP. The Airport shall revise the RSA Project HCEP to incorporate the new Conservation Area 1 boundaries and extend the conservation area invasive species management for an additional 2 years. The 1.1 acres to be designated as open space is located immediately north of the Conservation Area 1 boundary and within the existing airport perimeter fence (refer to Proposed Conservation Replacement Area 1 in Figure 6).

BIO-28 To replace the 0.46 acre of Conservation Area 2 (coast live oak woodland) that would be removed by the construction of the Proposed Project and Alternative 1 North Access Road, the Airport shall designate 0.46 acre of existing coast live oak woodland as open space on the Airport Layout Plan and manage the resource per the guidelines of the HCEP. The Airport shall revise the RSA Project HCEP to incorporate the new Conservation Area 2 boundaries and extend the conservation area invasive species management for an additional 2 years. The 0.46 acre to be designated as open space is located at the northwest corner of the airport property near the existing detention basin (refer to Proposed Conservation Replacement Area 2 in Figure 6).

8 MASTER PLAN PROGRAMMATIC IMPACT ANALYSIS

The programmatic impact assessment focuses on identifying potential impacts associated with implementation of the proposed AMP developments and is based on the site's existing conditions, the regulatory setting, and the project description provided by the Airport. The emphasis is on determining the potential effects of the master plan on federally, state, and locally regulated species and habitats in the AMP development areas. Adverse impacts could occur if the proposed AMP projects would result in temporary or permanent modification to jurisdictional habitats or to habitats occupied by special-status species. Where potential impacts to sensitive resources may occur, measures for avoiding, minimizing, or mitigating adverse effects to the resources are recommended. It is assumed that the provided measures would be incorporated in to future CEQA documents prepared for the specific projects.

8.1 Threshold #1: Candidate, Sensitive, or Special-status Species

Development of the following proposed long-term AMP components have the potential to directly or indirectly impact candidate, sensitive, or special-status species:

- Construction of non-aviation uses on the north and south sides of the airport.
- Upgrade the perimeter fence
- Construct a consolidated maintenance building
- Extend Taxiway B to the Runway 28L threshold and construct geometry improvements for Taxiways K and L.

Table 10 lists the special-status species that are known to occupy these AMP development areas, as shown in Appendix A. Refer to Section 9, Master Plan Programmatic Mitigation for the measures listed in each discussion below.

Table 10. Summary of Special-Status Species Observed in the AMP Areas

Species Name	Legal Status Federal/State/CNPS	Occupied Study Areas
sandmat manzanita *Arctostaphylos pumila*	--/--/1B.2	Sandmat manzanita occurs in all non-aviation development areas, extended Taxiway B development area, perimeter fence upgrade area, and the consolidated maintenance building area.
Monterey spineflower *Chorizanthe pungens*	FT/--/1B.2	Monterey spineflower occurs in all non-aviation development areas, extended Taxiway B development area, perimeter fence upgrade area, and the consolidated maintenance building area.
Eastwood's goldenbush *Ericameria fasciculata*	--/--/1B.1	Eastwood's goldenbush occurs in the northern non-aviation development areas and the perimeter fence upgrade area.
Monterey ceanothus *Ceanothus cuneatus* var. *rigidus*	--/--/4.2	Monterey ceanothus occurs in the northern non-aviation development areas and the perimeter fence upgrade area.
Yadon's piperia *Piperia yadonii*	FE/--/1B.1	Yadon's piperia occurs in all non-aviation development areas and the perimeter fence upgrade area.
Small-leaved lomatium *Lomatium parvifolium*	--/--/4.2	Small-leaved lomatium occurs in all non-aviation development areas and the perimeter fence upgrade area.
seaside bird's beak *Cordylanthus rigidus* ssp. *littoralis*	--/SE/1B.1	Seaside bird's beak occurs in southeastern non-aviation development area.
Monterey pine *Pinus radiata*	--/--/1B.1	Monterey pine trees occur in all non-aviation development areas, extended Taxiway B development area, perimeter fence upgrade area, and the consolidated maintenance building area.

Status Codes

-- = No status

Federal: FE = Federal Endangered; FT=Federal Threatened

State: SE=State Endangered; ST= State Threatened; SR= State Rare

CNPS: Rank 1B = rare, threatened, or endangered in California and elsewhere. Rank 2 = rare, threatened, or endangered in California, but more common elsewhere. Rank 3 = plants about which more information is needed. Rank 4 = a watch list plants of limited distribution.
Threat Code: _.1 = Seriously endangered in California (over 80% of occurrences threatened / high degree and immediacy of threat); _.2 = Fairly endangered in California (20-80% occurrences threatened); _.3 = Not very endangered in California (<20% of occurrences threatened or no current threats known)

In addition to the species listed in Table 10, other special-status species including but not limited to California legless lizards, California horned lark (*Eremophila alpestris actia*), loggerhead shrike (*Lanius ludovicianus*), sharp-shinned hawk (*Accipiter striatus*), and Monterey manzanita (*Arctostaphylos montereyensis*) may occur in the AMP development areas. Potential direct impacts to these species could include physically removing, trampling, or destroying individuals that occupy the development areas. Indirect impacts could include altering the existing conditions in the development areas in such a way that the nearby areas could no longer support the special-status species.

8.1.1 California Red-Legged Frog and California Tiger Salamander

The only potential habitat for amphibious species on the airport property is the stormwater detention basin on the northern portion of the airport property. The detention basin is routinely managed for stormwater collection and is surrounded by urban development. The ongoing management and urban development in the area likely precludes the presence of CRF and CTS. As proposed, the AMP would designate the detention basin and adjacent oak woodland as Conservation Area 4 and include the area as open space on the Airport Layout Plan; therefore, adverse impacts to the basin and adjacent oak woodland are not expected.

8.2 Threshold #2: Riparian Habitat or Sensitive Natural Community

The non-aviation development and perimeter fence upgrade components of the AMP could result in direct and indirect effects on sandmat manzanita chaparral, Monterey pine forest, and coast live oak woodland. Direct impacts could include the physical removal of the communities and conversion of the lands to developed areas. Indirect effects include erosion, accidental grading or equipment maneuvering in the communities, and spread of nonnative species that may negatively affect the natural processes that support the communities. Measures BIO-AMP4 through BIO-AMP7 are recommended to address impacts to sensitive natural communities and the flora and fauna that occupy the communities.

8.3 Threshold #3: Wetlands

The AMP development areas do not contain jurisdictional wetlands or other waters; Therefore, impacts to jurisdictional wetlands or other waters are not expected to result from the AMP projects.

8.4 Threshold #4: Movement of Resident or Migratory Species

The AOA on the airport property is fenced per FAA safety requirements. Portions of the airport property that are not included in the AOA are surrounded by existing development. The existing perimeter fence and development in the area limits the use of the airport property as a migratory route for resident wildlife species. However, common wildlife species such as California mule deer and coyote use the undeveloped portions of the airport property for foraging and shelter. Although the AMP projects may reduce the available foraging and shelter area for resident deer and coyote in the area, implementation of the AMP project is not expected to significantly disrupt a migratory corridor.

8.5 Threshold #5: Local Policies or Ordinances Regarding Biological Resources

The non-aviation development located on the south side of the airport would be conducted on lands that are within City jurisdiction and are subject to City Code Chapter 37, Preservation of Trees and Shrubs. Specifically, Section 37-2.5 Protection of Trees During Construction, Section 37-8 Removal or Damaging Trees on Private Property; Permit Required, and Section 37-11 Conditions of Removal/Mitigation Measures of the City Code are applicable.

In addition to impacts to trees, the non-aviation development components of the AMP that are within City jurisdiction have the potential to impact vegetation types identified for protection in the City of Monterey Conservation Element goals and policies. The goals and policies listed below are pertinent to the AMP components that would occur within City jurisdiction.

- **Goal d.** Protect the character and composition of existing native vegetative communities. Conserve, manage, and restore habitats for endangered species, and protect biological diversity represented by special-status plant and wildlife species.
    - **Policy d.1.** Protect existing native plants and promote the use of locally occurring, native vegetation for public and private landscaping and revegetation efforts.
    - **Policy d.2.** Discourage the use of plant species on the California Exotic Pest Plant Council lists.

- **Policy d.3.** Protect existing sensitive habitats by careful planning to avoid and/or mitigate significant impacts to habitat areas identified as having high and moderate biological values.
- **Policy d.4.** Protect and manage habitats that support special-status species, are of high biological diversity, or are unusual or regionally restricted. Prepare biotic reports or habitat management plans as needed to ensure protection of habitat values.
- **Policy d.5.** Reduce biotic impacts to a less-than-significant level on project sites by ensuring that mitigation measures identified in biotic reports are incorporated as conditions of approval for development projects. Compliance with the City Tree Ordinance is the mechanism that will be used to address impacts of tree removals. As mitigation for significant impacts, avoidance, replacement, restoration of habitats on- or off-site or other measures may be required.
- **Policy d.6.** Within identified habitat areas with high biological value, the City will provide for a focused evaluation of areas identified as appropriate habitat for special-status species during the project review and approval process.

8.6 Threshold #6: Conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other Conservation Plan

The AMP perimeter fence upgrade has the potential to directly impact the existing RSA Project Conservation Area 1, Conservation Area 2, and/or Proposed Conservation Replacement Area 1. Direct impacts to these conservation areas could include constructing the fence in an alignment that traverses one or more of the conservation areas, which would require vegetation removal and/or erosion in the affected conservation areas. These conservation areas were established to mitigate the impacts to sensitive natural communities and the special-status species that occupy the communities that resulted from the RSA Project. As such, any future project that results in the removal of all or a portion of the conservation areas must replace the impacted area to maintain compliance with past CEQA documentation.

9 MASTER PLAN PROGRAMMATIC MITIGATION

9.1 Threshold #1: Candidate, Sensitive, or Special-status Species

BIO-AMP1 Prior to approving any AMP development projects on undeveloped lands at the airport, the Project Sponsor shall retain a qualified biologist to conduct floristic botanical surveys and wildlife surveys in the proposed project area(s) and prepare a BRSR. The surveys and subsequent BRSR shall determine if special-status species occur in the development area(s) and if special-status species would be impacted by the proposed project(s). If impacts to special-status species would occur, the biologist and the Project Sponsor shall develop mitigation strategies to address the impacts. The following recommendations for mitigation ratios/strategies for some plants known to occur in the development areas may be applied to the proposed project(s):

- **Seaside bird's beak:** The Project Sponsor shall coordinate with the CDFW to obtain a Section 2081 Incidental Take Permit under the CESA. Under the Section 2081 Incidental Take Permit, mitigation ratios for seaside bird's beak may require

purchasing replacement habitat that is occupied by the species and conducting rehabilitation efforts on the replacement land.

- **Yadon's piperia:** For AMP projects with a federal nexus, the Project Sponsor shall coordinate with the FAA and USFWS during the ESA Section 7 process. Mitigation may require the Project Sponsor to implement minimization and conservation measures that relocate the individuals to be impacted. If these efforts fail or are deemed insufficient by USFWS, purchasing replacement habitat that is occupied by the species and conducting rehabilitation efforts on the replacement land may be required.
    - For projects that do not have a federal nexus, the Project Sponsor shall implement BIO-9.
- **Monterey spineflower:** For AMP projects with a federal nexus, the Project Sponsor shall coordinate with the FAA and USFWS during the ESA Section 7 process. Mitigation may require the Project Sponsor to implement minimization and conservation measures that involve seed and seed bank collection and redistribution on the airport property.
    - For projects that do not have a federal nexus, the Project Sponsor shall implement BIO-7.
- **CNPS Rare Plant Ranked 1, 2, and 3 species:** For each CNPS Rare Plant Ranked 1, 2, and 3 species (excluding Monterey pine) impacted by a proposed project(s), the Project Sponsor shall plant two container plants of the same species for each one plant impacted (2:1). The replacement plantings shall be planted in any of the four onsite conservation areas or an established offsite conservation area. The replacement plantings shall be monitored and maintained for no less than 5 years.
- **CNPS Rare Plant Ranked 4 species:** For each CNPS Rare Plant Rank 4 species impacted by a proposed project(s), the Project Sponsor shall:
    - For annual species, collect seed prior to project disturbance and redistribute the collected seed in suitable habitat in the project area following completion of disturbance
    - For perennial species, propagate and plant one container plant of the same species for each one plant impacted (1:1). The container plants shall be planted in any of the four onsite conservation areas or an established off-site conservation area. The replacement plantings shall be maintained and monitored for no less than 3 years.

BIO-AMP2 To the maximum extent possible, initial vegetation-clearing activities in the project areas should be conducted between October and February, which is outside of the typical bird breeding season. If the project schedule does not provide for late season vegetation removal, a nesting bird survey will be conducted by a qualified biologist no more than 1 week prior to the land clearing to determine presence/absence of nesting birds within the vegetated area. If active nests are observed, work activities will be avoided within 100 feet of the active nest(s) until young birds have fledged and left the nest. The nests shall be monitored weekly by a biologist having experience with nesting birds to determine when the nest(s) become inactive. The buffer may be reduced but not eliminated during active nesting if deemed appropriate by the biologist. Readily visible exclusion zones will be established in areas where nests must be avoided. The Airport and the appropriate regulatory agency will be contacted if any federally or state-listed bird species are

observed during surveys. Nests, eggs, or young of birds covered by the MBTA and CFGC will not be moved or disturbed until the young have fledged. The biologists shall submit a letter report to the Project Sponsor, documenting project compliance with the MBTA and CFGC Section 3503.

BIO-AMP3 Within 30 days prior to site grading, the environmental monitor shall conduct surveys for California legless lizards and other reptiles. The surveyor should utilize hand search or cover board methods in areas of disturbance where legless lizards are expected to be found (e.g., under shrubs, other vegetation, or debris). If cover board methods are used, they should commence at least 30 days prior to the start of construction. If hand search methods are used, the surveys should be completed immediately prior to and during grading activities. The surveyor should capture and relocate any legless lizards or other reptiles observed during the survey effort. The captured individuals should be relocated from the construction area(s) and placed in suitable habitat on the airport property.

9.2 Threshold #2: Riparian Habitat or Sensitive Natural Community

BIO-AMP4 Prior to approving any project in the proposed non-aviation development areas or the upgraded perimeter fence alignment that would convert undeveloped lands to developed areas or otherwise remove vegetation, the Project Sponsor shall retain a qualified biologist to map and quantify the vegetative communities that are present in the project area and determine if the project would result in a net loss of sandmat manzanita chaparral, Monterey pine forest, and/or coast live oak woodland.

- If a net loss of sandmat manzanita chaparral would occur, the Project Sponsor shall preserve and rehabilitate, re-establish, or create additional sandmat manzanita chaparral at a 2:1 ratio. The preserved sandmat manzanita chaparral may be located on the existing airport property or offsite, as appropriate.
- If a net loss of coast live oak woodlands would occur, the Project Sponsor shall conduct one or a combination of the following:
    - preserve and rehabilitate, re-establish, or create additional coast live oak woodland at a 2:1 ratio. The preserved coast live oak woodland may be located on the existing airport property or off-site, as appropriate.
    - Plant two coast live oak trees for each one coast live oak tree removed. Replacement trees may be planted on the existing airport property or offsite, as appropriate. Replacement trees should be grown from local (Monterey Peninsula) stock.
    - contribute $1,000 to the Oak Woodlands Conservation Fund, as established under subdivision (a) of Section 1363 of the CFGC per each coast live oak tree removed for the project. The Project Sponsor shall coordinate with the CDFW and the State Wildlife Conservation Board to ensure that the contributed funds will be granted to the State Wildlife Conservation Board for the purpose of purchasing oak woodland conservation easements.
- If the proposed project(s) would impact Monterey pine forest, the Project Sponsor shall design the proposed project(s) to minimize the impact to the greatest extent possible. If Monterey pine trees will be removed for the proposed project(s), the Project Sponsor shall incorporate Monterey Pine trees into the

project designs, in such a manner that does not conflict with safe flight operations at the airport.

- For any AMP project that results in a net loss of sandmat manzanita chaparral or coast live oak woodland that will be mitigated through the preservation and rehabilitation, re-establishment, or creation of habitat, the Project Sponsor shall develop a project-specific Habitat Mitigation and Monitoring Plan (HMMP). The HMMP shall: (1) identify the project description and mitigation requirements; (2) identify the responsible parties; (3) map and quantify all preservation/mitigation areas; (4) provide detailed discussions of the methods for implementing the mitigation program including invasive species removal, sources of plant materials, and supplemental watering regimes; (5) identify the locations, amounts, sizes, and types of plants to be planted; (6) Identify necessary components (e.g., temporary irrigation, amendments, etc.) to ensure successful plant re-establishment; and (7) provide a program schedule and established success criteria for a monitoring and reporting program that is structured to ensure the success of the mitigation.

BIO-AMP5 For any AMP project that has potential to impact a sensitive natural community or a special-status species, the Project Sponsor shall retain an environmental monitor for all measures requiring environmental mitigation to ensure compliance with the CEQA measures. The monitor shall be responsible for: (1) ensuring that procedures for verifying compliance with environmental mitigations are implemented; (2) establishing lines of communication and reporting methods; (3) conducting compliance reporting; (4) conducting construction crew training regarding environmentally sensitive areas; (5) maintaining authority to stop work; and (6) outlining actions to be taken in the event of non-compliance.

BIO-AMP6 For any AMP project that has potential to impact a sensitive natural community or will be conducted adjacent to a sensitive natural community, the Project Sponsor shall incorporate the use of construction delineation fencing to exclude construction-related impacts to the adjacent resources. The monitoring biologist shall field-fit the placement of the project delineation fencing to minimize impacts to adjacent communities and other sensitive resources. The project delineation fencing shall remain in place and functional throughout the duration of the project and no work activities shall occur outside the delineated work area.

BIO-AMP7 For any AMP project that has potential to impact a sensitive natural community or a special-status species, the environmental monitor shall conduct an environmental awareness training for all construction personnel prior to the commencement of ground disturbing activities. The environmental awareness training shall include discussions of the special communities and special-status species that occur in the project area. Topics of discussion shall include: description of the species' habitats; general provisions and protections afforded by the FESA and CEQA; measures implemented to protect special-status species; review of the project boundaries and special conditions; the monitor's role in project activities; lines of communication; and procedures to be implemented in the event a special-status species is observed in the work area.

9.3 Threshold #3: Wetlands

The AMP projects are not expected to have impacts on jurisdictional wetlands or other waters; therefore, mitigation for jurisdictional waters are not recommended.

9.4 Threshold #4: Movement of Resident or Migratory Species

Significant effects on the movement of resident or migratory species are not expected to result from the AMP projects; therefore, mitigation for impacts on the movement of wildlife is not recommended.

9.5 Threshold #5: Local Policies or Ordinances Regarding Biological Resources

BIO-AMP8 The Project Sponsor shall incorporate California native plant species in the landscape designs of any AMP development project that is conducted within City jurisdiction.

BIO-AMP9 The Project Sponsor shall not utilize any plant species that are listed on the California Exotic Pest Plant Council lists in the landscape designs of any AMP development project that is conducted within City jurisdiction.

BIO-AMP10 For any AMP project conducted within City jurisdiction that will result in the removal of coast live oak, Monterey pine, or Monterey cypress trees, the Project Sponsor shall conduct one of the following tree mitigation efforts:

- Per City Code 37-11(C), the Project Sponsor shall replace any coast live oak, Monterey Pine, or Monterey cypress tree(s) that are removed for AMP projects that occur within City jurisdiction, as directed by the City Forester. The replacement trees should be planted onsite, if feasible, but may be planted offsite if project conditions prohibit onsite planting. The removed trees shall be replaced at a ratio of up to three trees for every one tree removed.
- During the City of Monterey permitting process for the AMP development projects that are conducted within City jurisdiction, the Project Sponsor shall coordinate with the City Forester to determine an appropriate in-lieu fee for the replacement of coast live trees, Monterey pine trees, and/or Monterey cypress trees that would be removed for the project. Per City Code 37-11(D), the in-lieu fee payment to the City of Monterey shall be equivalent to the value of the removed trees or the cost of the numbers of replacement trees as determined by City Council Resolution. The value of the trees shall be established and conform to standards adopted by City Council Resolution. The payment shall be used to plant additional trees off-site in a location approved by the City Forester.

9.6 Threshold #6: Conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other Conservation Plan

BIO-AMP11 To avoid direct impacts to the conservation areas on the airport property, the Project Sponsor shall design the upgraded perimeter fence alignment to avoid the conservation areas. If full avoidance of the conservation areas is not feasible, the Project Sponsor shall replace on a 1:1 basis all portions of the affected conservation area(s) that will fall within the upgraded perimeter fence. The replacement conservation areas shall support the same vegetative community type as the affected conservation area. Replacement conservation areas should be located on the airport property, if feasible. If establishing a replacement conservation area on the airport property is not feasible, the Project Sponsor may establish a replacement conservation area offsite, provided the replacement conservation area supports the same vegetative community type as the affected conservation area.

IPaC Trust Resources Report

NAME

Monterey Regional Airport Safety Enhancement Project

LOCATION

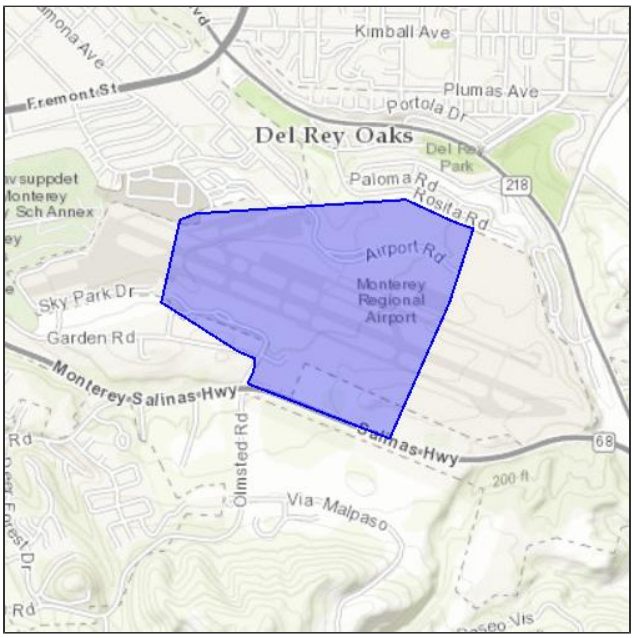
Monterey County, California

DESCRIPTION

Relocation of airport facilities including the terminal , parking, roadways, hangers, ARFF building, and connected actions.

IPAC LINK

https://ecos.fws.gov/ipac/project/OMH7W-X5WGZ-HOLC6-MIA3L-VBSQHE



U.S. Fish & Wildlife Service Contact Information

Trust resources in this location are managed by:

Ventura Fish And Wildlife Office
2493 Portola Road, Suite B
Ventura, CA 93003-7726
(805) 644-1766

Endangered Species

Proposed, candidate, threatened, and endangered species are managed by the Endangered Species Program of the U.S. Fish & Wildlife Service.

This USFWS trust resource report is for informational purposes only and should not be used for planning or analyzing project level impacts.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list from the Regulatory Documents section.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency.

A letter from the local office and a species list which fulfills this requirement can only be obtained by requesting an official species list either from the Regulatory Documents section in IPaC or from the local field office directly.

The list of species below are those that may occur or could potentially be affected by activities in this location:

Amphibians

California Red-legged Frog Rana draytonii — Threatened

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=D02D

California Tiger Salamander Ambystoma californiense — Threatened

CRITICAL HABITAT
There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=D01T

Birds

California Condor Gymnogyps californianus — Endangered

CRITICAL HABITAT
There is **final** critical habitat designated for this species.
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B002

Least Bell's Vireo Vireo bellii pusillus — Endangered

CRITICAL HABITAT
There is **final** critical habitat designated for this species.
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B067

Marbled Murrelet Brachyramphus marmoratus — Threatened

CRITICAL HABITAT
There is **final** critical habitat designated for this species.
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B08C

Southwestern Willow Flycatcher Empidonax traillii extimus — Endangered

CRITICAL HABITAT
There is **final** critical habitat designated for this species.
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B094

Western Snowy Plover Charadrius alexandrinus nivosus — Threatened

CRITICAL HABITAT
There is **final** critical habitat designated for this species.
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B07C

Crustaceans

Vernal Pool Fairy Shrimp Branchinecta lynchi — Threatened

CRITICAL HABITAT
There is **final** critical habitat designated for this species.
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=K03G

Fishes

Tidewater Goby Eucyclogobius newberryi — Endangered

CRITICAL HABITAT
There is **final** critical habitat designated for this species.
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=E071

Flowering Plants

Clover Lupine Lupinus tidestromii — Endangered

CRITICAL HABITAT

No critical habitat has been designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=Q2DD

Contra Costa Goldfields Lasthenia conjugens — Endangered

CRITICAL HABITAT

There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=Q122

Marsh Sandwort Arenaria paludicola — Endangered

CRITICAL HABITAT

No critical habitat has been designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=Q25H

Monterey Gilia Gilia tenuiflora ssp. arenaria — Endangered

CRITICAL HABITAT

No critical habitat has been designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=Q2AJ

Monterey Spineflower Chorizanthe pungens var. pungens — Threatened

CRITICAL HABITAT

There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=Q271

Yadon's Piperia Piperia yadonii — Endangered

CRITICAL HABITAT

There is **final** critical habitat designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=Q3FA

Insects

Smith's Blue Butterfly Euphilotes enoptes smithi — Endangered

CRITICAL HABITAT

No critical habitat has been designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=I00R

Mammals

Southern Sea Otter Enhydra lutris nereis — Threatened

CRITICAL HABITAT

No critical habitat has been designated for this species.

http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=A0A7

Critical Habitats

There are no critical habitats in this location

Migratory Birds

Birds are protected by the Migratory Bird Treaty Act and the Bald and Golden Eagle Protection Act.

Any activity that results in the take of migratory birds or eagles is prohibited unless authorized by the U.S. Fish & Wildlife Service.[1] There are no provisions for allowing the take of migratory birds that are unintentionally killed or injured.

Any person or organization who plans or conducts activities that may result in the take of migratory birds is responsible for complying with the appropriate regulations and implementing appropriate conservation measures.

---

1. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

The following species of migratory birds could potentially be affected by activities in this location:

Allen's Hummingbird Selasphorus sasin — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0LI

Bald Eagle Haliaeetus leucocephalus — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B008

Black Oystercatcher Haematopus bachmani — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0KJ

Black Swift Cypseloides niger — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0FW

Burrowing Owl Athene cunicularia — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0NC

Costa's Hummingbird Calypte costae — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0JE

Flammulated Owl Otus flammeolus — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0DK

Fox Sparrow Passerella iliaca — Bird of conservation concern
Season: Wintering

Lawrence's Goldfinch Carduelis lawrencei — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0J8

Lesser Yellowlegs Tringa flavipes — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0MD

Lewis's Woodpecker Melanerpes lewis — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0HQ

Long-billed Curlew Numenius americanus — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B06S

Marbled Godwit Limosa fedoa — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0JL

Nuttall's Woodpecker Picoides nuttallii — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0HT

Oak Titmouse Baeolophus inornatus — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0MJ

Olive-sided Flycatcher Contopus cooperi — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0AN

Peregrine Falcon Falco peregrinus — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0FU

Rufous-crowned Sparrow Aimophila ruficeps — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0MX

Short-billed Dowitcher Limnodromus griseus — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0JK

Short-eared Owl Asio flammeus — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0HD

Snowy Plover Charadrius alexandrinus — Bird of conservation concern
Season: Breeding

Tricolored Blackbird Agelaius tricolor — Bird of conservation concern
Season: Year-round
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B06P

Western Grebe aechmophorus occidentalis — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0EA

Whimbrel Numenius phaeopus — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0JN

Yellow Warbler dendroica petechia ssp. brewsteri — Bird of conservation concern
Season: Breeding
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0EN

Red Knot Calidris canutus ssp. roselaari — Bird of conservation concern
Season: Wintering
http://ecos.fws.gov/tess_public/profile/speciesProfile.action?spcode=B0G6

Wildlife refuges and fish hatcheries

There are no refuges or fish hatcheries in this location

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

DATA LIMITATIONS

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

DATA EXCLUSIONS

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

DATA PRECAUTIONS

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

This location overlaps all or part of the following wetlands:

Freshwater Emergent Wetland

PEMCh

A full description for each wetland code can be found at the National Wetlands Inventory website: http://107.20.228.18/decoders/wetlands.aspx

APPENDIX C

Species Observed

Table C-1. Plant Species Observed

Scientific Name	Common Name	Native	Species Status / Notes
Vascular Plants nomenclature follows *The Jepson Manual* and http://ucjeps.berkeley.edu/interchange.html.			
LYCOPHYTES			
Selaginellaceae	**Spike-moss family**		
Selaginella bigelovii	Bigelow's moss fern	yes	
PTERIDOPHYTES			
Dennstaedtiaceae	**Bracken family**		
Pteridium aquilinum	bracken fern	Yes	
Dryopteridaceae	**Wood fern family**		
Dryopteris arguta	coastal wood fern		
Pteridaceae	**Brake family**		
Adiantum jordanii	California maiden-hair		
Pentagramma triangularis	goldback fern	Yes	
GYMNOSPERMS			
Cupressaceae	**Cypress family**		
Cupressus macrocarpa	Monterey cypress	Yes	Planted specimens
Pinaceae	Pine family		
Pinus pinea	Italian stone pine	No	
Pinus radiata	Monterey pine	Yes*	
ANGIOSPERMS (DICOTS)			
Aizoaceae	**Fig-marigold family**		
Carpobrotus chilensis	ice plant	No	Cal-IPC: moderate
Anacardiaceae	**Sumac family**		
Toxicodendron diversilobum	poison oak	Yes	
Apiaceae	**Carrot family**		
Conium maculatum	poison hemlock	No	Cal-IPC: moderate
Daucus pusillus	rattle snake weed	Yes	
Lomatium parvifolium	small-leaved lomatium	Yes	CNPS Rank 4.2
Sanicula crassicaulis	gamble weed	Yes	
Sanicula laciniata	coast sanicle	Yes	
Araceae	**Arum family**		
Zantedeschia aethiopica	calla lily	No	
Araliaceae	**Ginseng family**		
Hedera helix	English ivy	No	Cal-IPC: high
Asteraceae	**Sunflower family**		
Achillea millefolium	yarrow	Yes	
Achyrachaena mollis	blow-wives	Yes	
Anthemis cotula	mayweed	No	Cal-IPC: moderate

Scientific Name	Common Name	Native	Species Status / Notes
Artemisia californica	California sagebrush	Yes	
Artemisia douglasiana	mugwort	Yes	
Baccharis pilularis var. *consanguinea*	coyote brush	Yes	
Carduus pycnocephalus	Italian thistle	No	Cal-IPC: moderate
Carduus tenuiflorus	winged thistle	No	Cal-IPC: limited
Centaurea melitensis	tocolote	No	Cal-IPC: moderate
Cirsium occidentale	cobweb thistle	Yes	
Corethrogyne filaginifolia	California aster	Yes	
Deinandra corymbosa	coast tarweed	Yes	
Delairea odorata	German ivy	No	Cal-IPC: High
Dimorphotheca ecklonis	African daisy	No	
Ericameria ericoides	mock heather	Yes	
Ericameria fasciculata	Eastwood's goldenbush	Yes	CNPS Rank 1B.1
Erigeron canadensis	horseweed	Yes	
Erigeron foliosus	Leafy fleabane	Yes	
Eriophyllum confertifolium	golden yarrow	Yes	
Gamochaeta ustulata	featherweed	Yes	
Hesperevax sparsiflora	erect dwarf cudweed	Yes	
Heterotheca grandiflora	telegraph weed	Yes	
Hypochaeris glabra	smooth cat's ear	No	Cal-IPC: limited
Hypochaeris radicata	rough cat's ear	No	Cal-IPC: moderate
Lessingina pectinata var. *pectinata*	valley lessingia	Yes	
Logfia gallica	narrow-leafed filago	No	
Madia sativa	Coastal tarweed	Yes	
Pseudognaphalium californicum	lady's tobacco	Yes	
Pseudognaphalium luteoalbum	cudweed	No	
Senecio vulgaris	ragwort	No	
Sonchus oleraceus	sow thistle	No	
Stephanomeria sp.	wire lettuce	na	No flower or fruit structures
Taraxacum officinale	dandelion	No	
Tragopogon porrifolius	purple salsify	No	
Uropappus lindleyi	silver puffs	Yes	
Boraginaceae	**Borage family**		
Amsinckia menziesii	Small flowered fiddleneck	Yes	
Cryptantha leiocarpa	coast cryptantha	Yes	
Phacelia brachyloba	short lobed phacelia	Yes	
Pholistoma auritum var. *auritum*	blue fiesta flower	Yes	
Plagiobothrys nothofulvos	rusty popcorn flower	Yes	

Scientific Name	Common Name	Native	Species Status / Notes
Brassicaceae	**Mustard family**		
Descuriana pinnata	western tansy mustard	Yes	
Hirschfeldia incana	summer mustard	No	
Lobularia maritima	Sweet alyssum	No	Cal-IPC: limited
Raphanus sativus	wild radish	No	
Sisymbrium officinale	hedge mustard	No	
Teesdalia nudicaulis	Barestem teesdalia	No	
Caprifoliaceae	**Honeysuckle family**		
Lonicera interrupta	Chaparral honeysuckle		
Sambucus nigra	black elderberry	Yes	
Symphoricarpos mollis	creeping snowberry	Yes	
Caryophyllaceae	**Pink family**		
Cardionema ramosissimum	sand mat	Yes	
Cerastium glomeratum	mouseear chickweed	No	
Silene gallica	catchfly	No	
Spergula arvensis	corn spurry	No	
Stellaria media	chickweed	No	
Cistaceae	**Rock-rose family**		
Cistus incanus	hairy rockrose	No	
Cistus monspeliensis	resinous rockrose	No	
Helianthemum scoparium	broom rose	Yes	
Crassulaceae	**Stonecrop family**		
Crassula tillaea	pygmy weed	No	
Dudleya sp.	varietals		No flowers
Cucurbitaceae	**Gourd family**		
Marah fabaceus var. *fabaceus*	wild cucumber	Yes	
Ericaceae	**Heath family**		
Arbutus menziesii	Pacific madrone	Yes	
Arctostaphylos montereyensis	Toro manzanita	Yes	CNPS Rank 1B.2
Arctostaphylos pumila	sandmat manzanita	Yes	CNPS Rank 1B.2
Arctostaphylos sp.	varietals	No	Ornamental in landscape
Arctostaphylos tomentosa ssp. *bracteosa*	bristly-twig manzanita	Yes	
Arctostaphylos tomentosa ssp. *tomentosa*	woolly-leafed manzanita	Yes	
Euphorbiaceae	**Spurge family**		
Croton californicus	croton	Yes	
Euphorbia peplus	petty spurge	No	
Fabaceae	**Pea family**		
Acacia sp.	Acacia	No	
Acacia longifolia	golden wattle	No	

Scientific Name	Common Name	Native	Species Status / Notes
Acacia melanoxylon	blackwood acacia	No	Cal-IPC: limited
Acmispon americanus	Spanish lotus	Yes	
Acmispon glaber	deer weed	Yes	
Acmispon strigosus	strigose lotus	Yes	
Acmispon wrangelianus	Chilean trefoil	Yes	
Genista monspessulana	French broom	No	Cal-IPC: high
Lathyrus vestitus var. *vestitus*	common pacific pea	Yes	
Lupinus arboreus	yellow bush lupine	Yes	
Lupinus bicolor	miniature lupine	Yes	
Lupinus chamissonis	dune lupine	Yes	
Lupinus nanus	sky lupine	Yes	
Melilotus alba	white sweetclover	No	
Medicago polymorpha	bur clover	No	Cal-IPC: limited
Trifolium angustifolium	narrow leaved clover	No	
Trifolium arvense	rabbitfoot clover	No	
Trifolium campestre	hop clover	No	
Trifolium dubium	shamrock clover	No	
Trifolium hirtum	rose clover	No	Cal-IPC: moderate
Trifolium subterraneum	sub clover	No	
Trifolium wormskioldii	coast clover	Yes	
Vicia americana var. *americana*	American vetch	Yes	
Vicia sativa	spring vetch	No	
Vicia villosa	hairy vetch	No	Cal-IPC: limited
Fagaceae	**Oak family**		
Quercus agrifolia	coast live oak	Yes	
Garryaceae	**Silk tassel family**		
Garrya elliptica	Coast silk tassel	Yes	
Geraniaceae	**Geranium family**		
Erodium cicutarium	red-stemmed filaree	No	Cal-IPC: limited
Erodium botrys	filaree	No	
Erodium moschatum	white stemmed filaree	No	
Geranium bicknellii	Bicknell's cranesbill	Yes	
Geranium dissectum	cut-leaved geranium	No	
Geranium molle	dove's foot geranium	No	
Grossilariaceae	**Gooseberry Family**		
Ribes speciosum	fuchsia-flowered gooseberry	Yes	
Lamiaceae	**Mint Family**		
Clinopodium douglasii	yerba buena	Yes	
Lamium amplexicaule	henbit	No	

Scientific Name	Common Name	Native	Species Status / Notes
Monardella sinuata ssp. *nigresce*	Curly-leaved monardella	Yes	CNPS Rank 1B.2; observed on airport property but outside study areas
Salvia mellifera	black sage	Yes	
Salvia spathacea	pitcher sage	Yes	
Stachys bullata	hedge nettle	Yes	
Malvaceae	**Mallow family**		
Malva parviflora	cheeseweed	No	
Montiaceae	**Miner's lettuce Family**		
Claytonia parviflora	miner's lettuce	Yes	
Claytonia perfoliata	miner's lettuce	Yes	
Myrsinaceae	**Myrsine Family**		
Lysimachia arvensis	scarlet pimpernel	No	
Myrtaceae	**Myrtle family**		
Callistemon citrinus	crimson bottlebrush	No	Escaped cultivar
Eucalyptus globulus	blue gum	No

Themidaceae	**Brodiaea family**		
Dichelostemma capitatum	blue dicks	Yes	
Triteleia hyacinthine	white brodiaea	Yes	

Notes: Cal-IPC = California Invasive Plant Council

Cal-IPC Ratings Explanations:

High = These species have severe ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal and establishment. Most are widely distributed ecologically.

Moderate = These species have substantial and apparent-but generally not severe-ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal, though establishment is generally dependent upon ecological disturbance. Ecological amplitude and distribution may range from limited to widespread.

Limited = These species are invasive but their ecological impacts are minor on a statewide level or there was not enough information to justify a higher score. Their reproductive biology and other attributes result in low to moderate rates of invasiveness. Ecological amplitude and distribution are generally limited, but these species may be locally persistent and problematic.

Table C-2. Wildlife Species Observed

Scientific Name	Common Name
BIRDS	
Wading Birds	
Ardia herodias	great blue heron
Ardea alba	great egret
Dabbling Ducks	
Anus platyrhynchos	mallard duck
Diurnal Raptors	
Cathartes aura	turkey vulture
Circus cyaneus	northern harrier
Accipiter cooperii	Cooper's hawk
Buteo jamaicensis	red-tailed hawk
Falco sparverius	American kestrel
Upland Game Birds	
Callipepla californica	California quail
Plovers, Oysercatchers, Stilts, and Avocets	
Charadrius vociferous	killdeer
Pluvialis squatarola	black-bellied plover
Skuas, Jaegers, and Gulls	
Larus occidentalis	western gull
Larus californicus	California gull
Pigeons and Doves	
Zenaida macroura	mourning dove
Streptopelia decaocto	Eurasian colored dove
Columba livia	rock pigeon
Owls	
Bubo virginianus	great horned owl
Tyto alba	barn owl
Hummingbirds	
Calypte anna	Anna's hummingbird
Woodpeckers	
Colaptes auratus	northern red-shafted flicker
Melanerpes formicivorus	acorn woodpecker
Tyrant Flycatchers	
Contopus sordidulus	western wood-pewee
Sayornis saya	Say's phoebe
Sayornis nigricans	black phoebe
Jays, Crows, and Allies	
Aphelocoma californica	California scrub jay

Scientific Name	Common Name
Corvus brachyrhynchos	American crow
Larks	
Eremophila alpestris	horned lark
Swallows	
Hirundo rustica	barn swallow
Tachycineta bicolor	tree swallow
Chickadees, Nuthatches, and Allies	
Baeolophus inornatus	oak titmouse
Psaltriparus minimus	bush tit
Poecile rufescens	chestnut-backed chickadee
Sitta carolinensis	white-breasted nuthatch
Certhia americana	brown creeper
Wrens	
Thryomanes bewickii	Bewick's wren
Troglodytes aedon	house wren
Dipper and Wrentit	
Chamaea fasciata	wrentit
Kinglets, Old World Warblers, and Gnatcatchers	
Regulus calendula	ruby-crowned kinglet
Thrushes	
Sialia mexicana	western bluebird
Toxostoma redivivum	California thrasher
Mimids	
Mimus polyglottos	northern mockingbird
Waxwings, Silky-Flycatchers, and Starlings	
Sturnus vulgaris	European starling
Wood-warblers	
Vermivora celata	orange-crowned warbler
Dendroica townsendi	Towsend's warbler
Emberizine Sparrows and Allies	
Zonotrichia leucophrys	white-crowned sparrow
Passer domesticus	house sparrow
Zonotrichia atricapella	golden crowned sparrow
Melospiza melodia	song sparrow
Pipilo crissalis	California towhee
Pipilo maculates	spotted towhee
Junco hymalis	dark-eyed junco
Icterids	
Sturnella neglecta	western meadowlark

Scientific Name	Common Name
Agelaius phoeniceus	red-winged blackbird
Euphagus cyanocephalus	Brewer's blackbird
Finches and Old World Sparrows	
Carpodacus mexicanus	house finch
Carduelis psaltria	lesser goldfinch
Carduelis tristis	American goldfinch
MAMMALS	
Canidae	
Canis latrans	coyote
Raccoons, Skunks, and Weasels	
Procyon lotor	common raccoon
Lagomorphs	
Sylvilagus bachmanii	brush rabbit
Rodents	
Sciurus griseus	Western gray squirrel
Spermophilus beecheyii	California ground squirrel
Ruminantia	
Odocoileus hemionus californicus	black-tailed deer
REPTILES	
Elgaria coerulea	Northern alligator lizard
Sceloporus occidentalis	western fence lizard
AMPHIBIANS	
Rana draytonii	California red-legged frog
Psuedacris regilla	Pacific chorus frog
GASTROPODS	
Helminthoglypta umbilicata	Big Sur shoulderband snail
Heliix aspersa	common garden snail
Oxychilus cellarius	cellar glass snail
ARACHNIDS	
Natalia Romanova	black widow

Re: Monterey Regional Airport Master Plan Tree and Vegetation Type Inventory / SWCA Project No. 37212

Dear Ms. Krauss:

Thank you for retaining SWCA Environmental Consultants to work with Coffman Associates and the Monterey Peninsula Airport District (MPAD) on the Monterey Regional Airport Master Plan Environmental Impact Report and Environmental Assessment project (project). We have completed the tree and vegetation type inventory for the anticipated project impact areas and have compiled the data obtained during the inventory surveys. The following report includes maps of the surveyed trees and a series of tables that summarize the survey data. In order to best present the data, SWCA created four maps and accompanying tables. Maps were prepared for the two southside improvement designs, the northside access road and general aviation relocation site, and the soil deposition area (Option 2). Upon request, SWCA will send Coffman Associates, MPAD, and/or other project team members the edited geographic information system (GIS) data that was used to create the attached maps and tables.

The methods used to collect the data included conducting pedestrian surveys of the anticipated impact areas and using the Global Positioning System (GPS) to mark the trees. The SWCA biologist utilized a Trimble® Geo/XT GPS Unit to map each tree located in or directly adjacent to the project limits that were provided by Coffman Associates and the project engineers. Each mapped tree was identified to species and measured for diameter at breast height (dbh). The dbh of most trees were measured at 4.5 feet above ground level on the uphill side of the tree. In some cases, the trees branched lower than 4.5 feet above the ground. In these cases, the diameter was measured below the branch. This typically occurred with the coast live oak (*Quercus agrifolia*) trees. In cases where an individual tree had multiple branches at or below dbh that originate from one root mass, the dbh of the largest branch was measured and the dbh of the remaining branches were estimated based on the dbh of the largest branch. If the surveyor could not confirm that the branches of a multi-branched clump were originating from one root mass, each branch was measured and mapped as an individual tree. Please feel free to contact me at tbelt@swca.com or (805) 543-7095, extension 6808, with any questions regarding the attached maps and tables.

Sincerely,

Travis Belt
Senior Biologist

SWCA Project No. 37212

SWCA Cultural Resources Report No. 18-175

April 2018

Archaeological and other heritage resources can be damaged or destroyed through uncontrolled public disclosure of information regarding their location. This document contains sensitive information regarding the nature and location of archaeological sites, which should not be disclosed to the general public or unauthorized persons.

Information regarding the location, character, or ownership of a cultural resource is exempt from the Freedom of Information Act pursuant to 54 USC 307103 (National Historic Preservation Act) and 16 USC Section 470(h) (Archaeological Resources Protections Act).

MANAGEMENT SUMMARY/ABSTRACT

Purpose and Scope: SWCA Environmental Consultants (SWCA) was retained by Coffman Associates to conduct a cultural resources survey in support of the Monterey Regional Airport (MRY) Airport Master Plan (AMP) in Monterey, Monterey County, California.

This study includes archival research, a cultural resources survey of the project area, and the preparation of this technical report, which documents the results of the inventory and provides management recommendations.

The intent of this Cultural Resources Survey Report (CRSR) is to identify potential cultural resources within and adjacent to the study area and, in turn, assist in the project's requirements to achieve National Historic Preservation Act (NHPA) Section 106 and California Environmental Quality Act (CEQA) compliance as it relates to cultural resources. For the purposes of this report, the study area comprises 182 acres and includes project-specific and programmatic development areas on the airport property.

Dates of Investigation: On June 2, 2014, staff at the Northwest Information Center (NWIC) at Sonoma State University, Rohnert Park, California, conducted a California Historical Resources Information System (CHRIS) records search of the entire airport property. SWCA obtained supplemental records search results on October 22, 2015. The field survey was conducted on April 26, 27, and 28, 2017, and March 17 and 18, 2018.

Investigation Constraints: The study area was entirely accessible; however, areas of dense vegetation and development precluded a comprehensive surface examination. Approximately 50 percent of the study area had zero to less than 25 percent visibility. The remainder of the study area had poor to good (25 to 75 percent) visibility. Total survey coverage included 137 acres of the 182-acre study area. Paved areas and those obscured by existing improvements were not subject to pedestrian survey (approximately 45 acres of the overall 182-acre study area).

Findings of the Investigation: Archival research revealed that the entire study area has been subject to some level of cultural resources study, including both architectural surveys and evaluations, archaeological surveys, archaeological monitoring, and archaeological data recovery. Several historic-era buildings are located within the study area; however, all but one (P-27-1459, Tarpy's Restaurant) have been determined ineligible for either the California Register of Historical Resources (CRHR) or the National Register of Historic Places (NRHP). Likewise, only one previously identified archaeological site is within the study area, which is the prehistoric component of P-27-1459 (CA-MNT-1438/H).

A portion of CA-MNT-1438/H was encountered during construction monitoring for the MRY Runway Safety Area (RSA) Improvement Project. As the portion of the archaeological site could not be avoided, it was assumed eligible for the NRHP/CRHR, and Pacific Legacy, Inc. undertook a data recovery program to mitigate impacts to the site. Following mitigation through data recovery, the portion of the site within the RSA's direct Area of Potential Effects (APE) (which overlaps with the current study area) was entirely destroyed by project-related excavations. Data recovery excavations revealed a diverse prehistoric assemblage with multiple subsurface features, and human remains. In addition, all site associated soils were excavated and relocated to an area on the airport known to not contain archaeological resources. (Holm et al. 2016). Although this location is outside of any currently proposed projects associated with the AMP, it is within the study area.

Cultural resources survey of the study area revealed the airport is heavily disturbed from its original construction and subsequent historic and modern development. Dozens of historic-era buildings, structures, and access routes associated with mid-twentieth century development of the airport resulted in

extensive earth movement and modification of the native landscape. Historic aerials and maps depict a vast network of no longer extant historic features in the northern and northeastern portions of the study area (SWCA 2014) that have been demolished and removed from the airport property. Remnants of this earlier development include existing roads and access routes. In addition, the field survey identified a concrete foundation and associated concrete debris in the northern portion of the study area, designated MRY-HIST-001. Historic archaeological site MRY-HIST-001 consists of the foundational remnants of a target shooting range facility (personal communication with Chris Morello, MRY Project Manager, via email on April 10, 2018). The foundation is partially demolished, as evidenced by concrete debris piles adjacent to the site. Although partially obscured by dense vegetation, the visible portion of the foundation measures approximately 100 feet (northwest/southeast) by 35 feet (northeast/southwest) (Appendix C).

Historic archaeological site MRY-HIST-001 is not associated with any significant events or people (Criterion A/1 and B/2), the foundation is a typical example of construction type and material (Criterion C/2), the site does not have the ability to provide additional information regarding the history of the airport or region beyond what is already well-documented (Criterion D/4), and the site lacks integrity. As such, the site does not constitute a historical resource or historical property and warrants no further consideration.

In addition, dozens of isolated historic-era cans and bottles and miscellaneous historic-era debris (e.g., metal, glass, plastic) were observed throughout the study area; the majority was likely related to recreational use or mid-twentieth century development within the airport property. In addition, two abandoned mid-century automobiles were encountered in the southern portion of the study area, within the potential acquisition property along State Route (SR) 68. Due to the lack of context, the isolated historic debris and automobiles do not warrant formal documentation beyond their mention in this report.

Aside from the multi-component cultural resource, P-24-1459, which includes the CRHR- and NRHP-eligible Tarpy's Restaurant and archaeological site CA-MNT-1438/H, no significant cultural resources are known to occur within the study area.

Recommendations: Although no new, significant cultural resources were identified within the study area as a result of pedestrian survey and archival research, as with previous cultural resources studies conducted on the airport property, archaeological survey is problematic in this area due to dense vegetation cover and existing developments (e.g., runway and taxiways, buildings, roads). The pedestrian survey of the study area was conducted in a good faith effort, which included manual ground clearing at regular intervals in areas of low visibility; however, the lack of visibility and, in some cases, impenetrable vegetation creates inherent issues with negative findings. As such, mitigation measures, including worker awareness training, standard inadvertent discovery protocol, and the preparation of an archaeological monitoring plan in areas of dense vegetation are recommended for future proposed development(s) associated with the AMP. With the implementation of the proposed mitigation measures, impacts to previously unidentified cultural resources can potentially be avoided and/or reduced.

Disposition of Data: This report will be filed at the Northwest Information Center, Monterey Regional Airport, Federal Aviation Administration, Coffman Associates, and SWCA. All field notes and records related to the current project are on file at the San Luis Obispo office of SWCA.

INTRODUCTION

SWCA Environmental Consultants (SWCA) was retained by Coffman Associates to conduct a cultural resources survey in support of the Monterey Regional Airport (MRY) Airport Master Plan (AMP) in Monterey, Monterey County, California (Figure 1).

This study includes archival research, a cultural resource survey of the study area, and preparation of this technical report, which documents the results of the inventory and provides management recommendations.

The intent of this Cultural Resources Survey Report (CRSR) is to identify cultural resources within and adjacent to the study area, and, in turn, assist in the project's requirements to achieve National Historic Preservation Act (NHPA) Section 106 and California Environmental Quality Act (CEQA) compliance as it relates to archaeological resources. For the purposes of this CRSR, the study area comprises all areas proposed for either long- or short-term development as outlined in the AMP (Figure 2). The format of this report follows the *Archaeological Resource Management Reports (ARMR): Recommended Contents and Format* (California Office of Historic Preservation 1990).

Project Personnel

Cultural Resources Team Leader Leroy Laurie, B.S., and Cultural Resources Specialist Chad Jackson, B.S., conducted the cultural resources surveys. Mr. Laurie co-authored the report with Principal Investigator Heather Gibson, Ph.D., Registered Professional Archaeologist (RPA); Dr. Gibson exceeds the Secretary of the Interior's Professional Qualification Standards in history and archaeology. Geographic Information Systems (GIS) Specialist Kevin Howen, B.A., created the graphics for this report, and Jaimie Jones was the technical editor.

PROJECT DESCRIPTION

Proposed AMP short-term development projects (occurring within 10 years) will be evaluated within an Environmental Impact Report (EIR) at a project-specific level, while future long-term development projects (occurring within 20 years) will be evaluated to the level of detail feasible based on available project information (i.e., at a programmatic level). Proposed long-term development projects would likely develop in phases over a long period of time, and future environmental analysis could be required prior to their approval and construction. One primary aspect of the proposed AMP is a multi-component airport safety enhancement project. This project is known as the Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations (Airport Safety Enhancement Project). Due to the need for federal funding and approval, a federal Environmental Assessment (EA) is also being prepared consistent with the requirements of the National Environmental Policy Act (NEPA). The Federal Aviation Administrative (FAA) is the lead agency for the EA.

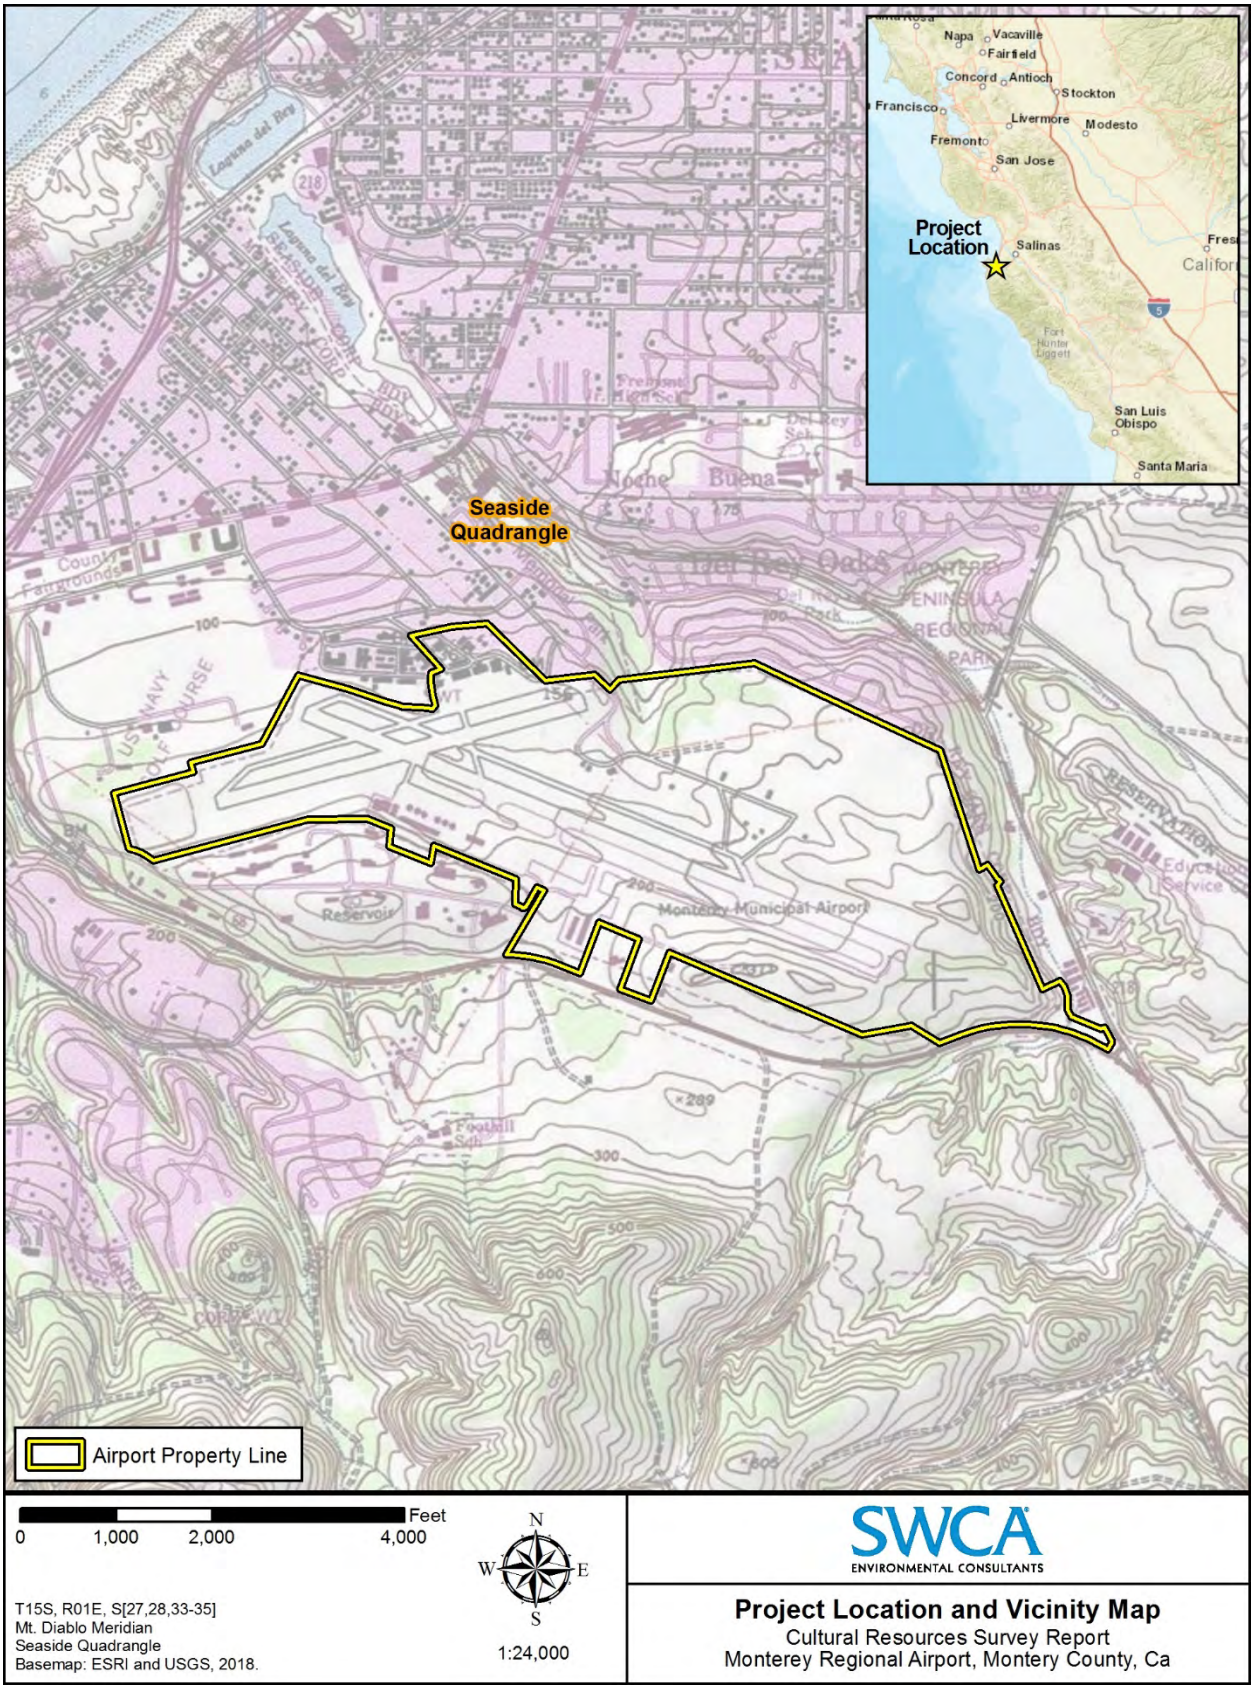

Figure 1. Project location and vicinity map.

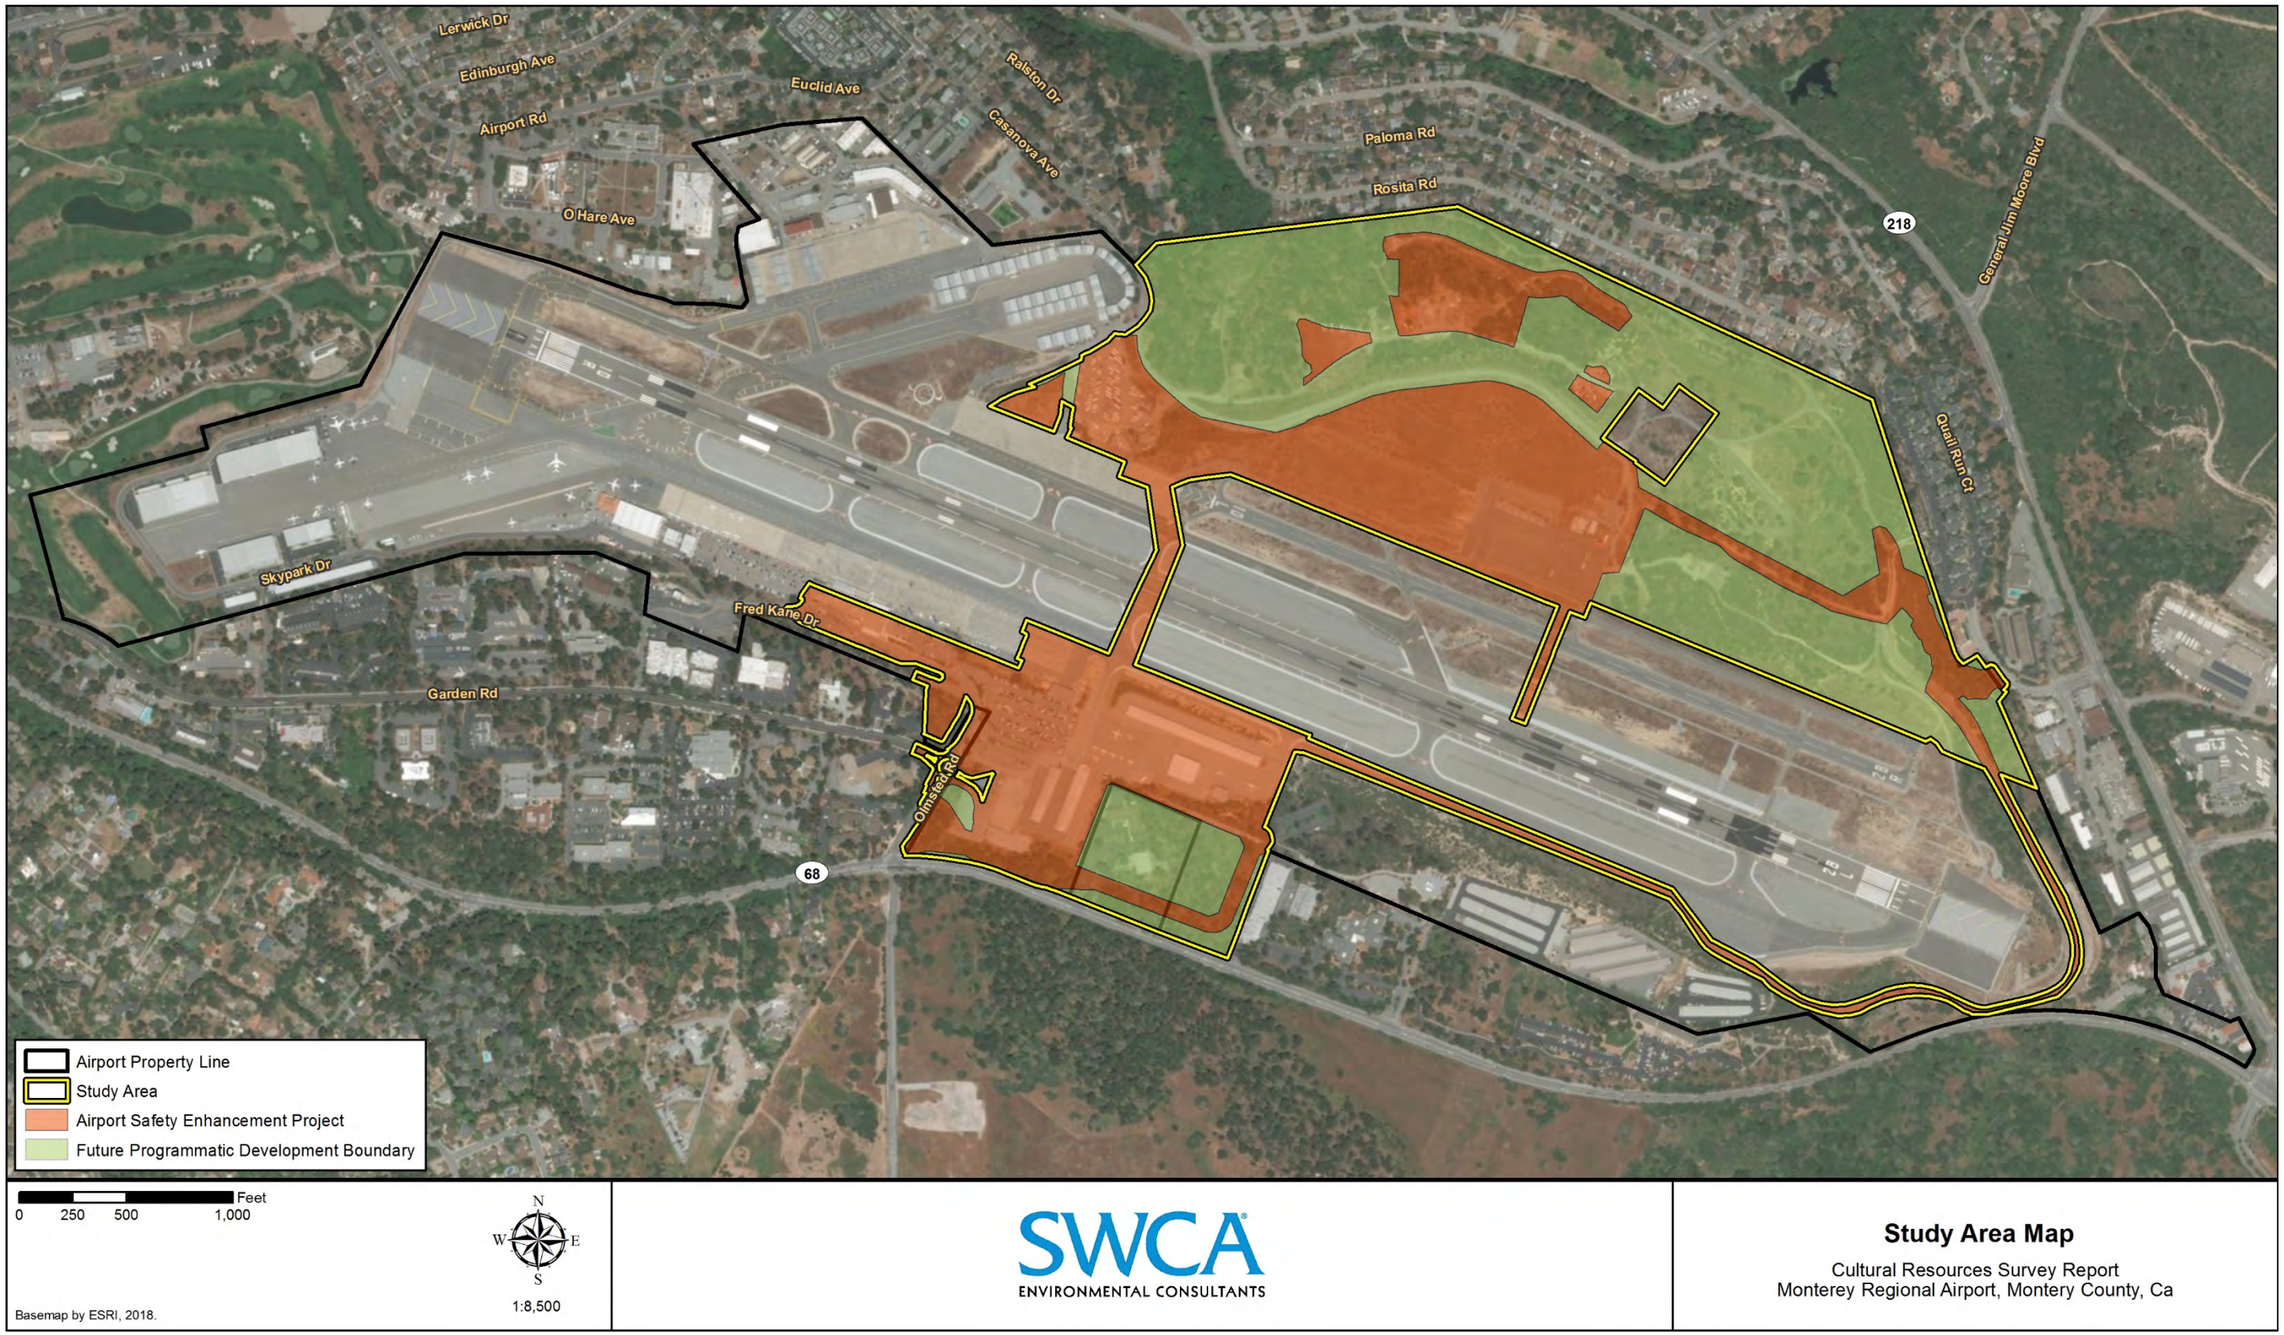

Figure 2. Study area map.

This page intentionally left blank.

The proposed Airport Safety Enhancement Project includes the following and would be phased over approximately 10 years:

- Relocate 44 general aviation (GA) hangars and a fuel tank from the southeast side of the airport to the north side of the airport.
- Add up to seven new GA hangars on the north side of the airport.
- Relocate the existing aircraft rescue and firefighting (ARFF) building and construct an ARFF service road.
- Relocate the commercial terminal and necessary apron pavement (and associated parking and roadway improvements).
- Close Taxiway "K" at its connection with the new commercial terminal apron.
- Implement a 52.5-foot southerly shift of 1,850 linear feet of Taxiway "A" and associated lighting, signage, and markings.
- Remark hold lines on Taxiway "A" at Taxiway Connectors "G" and "J" to a 250-foot separation from the Runway 10L-28R centerline.
- Install taxiway "islands" at Taxiway Connectors "G" and "J."
- Construct replacement vehicular parking along Fred Kane Drive.

Other proposed short-term AMP projects include:

- Acquire a 5.5-acre private parcel near the proposed commercial terminal complex.
- Construct a State Route (SR) 68 frontage road.

Proposed long-term AMP projects include:

- Construct 106 new GA hangars on the north side of the airport.
- Redevelop the existing GA (small aircraft) hangar area (no increase in use intensity).
- Redevelop the existing airport industrial area (no increase in use intensity).
- Construct non-aviation uses on the north side of the airport (north of Airport Road).
- Construct non-aviation uses on the south side of the airport (north of SR 68).
- Upgrade the perimeter fence.
- Construct a consolidated maintenance building
- Acquire runway protection zone (RPZ) land (20 acres).
- Acquire RPZ avigation easement (14 acres).
- Extend Taxiway "B" to the Runway 28L threshold and construct geometry improvements for Taxiways "K" and "L."

One additional AMP project is construction of a new "north side" road, which would extend from Del Rey Gardens Drive in Del Rey Oaks (off SR 218) to the northeast side of the airport. Access to the north side of the airport is currently provided via Airport Road, which runs through the Casanova Oak Knoll (CONA) neighborhood, located northwest of the airport. The new "north side" road would provide

additional access to the north side of the airport and would allow access through the CONA neighborhood for areas east of Gate 22 to be discontinued.

STUDY AREA

The project study area includes all short- and long-term MRY project components and comprises 182 acres. Note: the proposed RPZ acquisitions are not included in the study area as no proposed development is planned in these locations (see Figure 2).

Project Location

The proposed project is located at MRY in Monterey, Monterey County, California (see Figure 1). The airport is a commercial service aviation facility located immediately south of Fremont Street and between SR 68 and SR 218. The airport property includes 498.58 acres of developed and undeveloped land. The study area for this project includes 182 acres (see Figure 2).

REGULATORY SETTING

This section identifies federal and state legislation, in addition to local statutes, ordinances, and guidelines that govern the identification and treatment of cultural resources, as well as the analysis of project-related effects to these resources. The lead agency must consider these requirements when making decisions on projects that may affect cultural resources. The current project was undertaken in conformance with these regulations.

Federal Regulations

National Historic Preservation Act of 1966

Enacted in 1966 and amended most recently in 2014, the NHPA (54 United States Code [USC] 300101 et seq.) instituted a multifaceted program, administered by the Secretary of the Interior, to encourage sound preservation policies of the nation's cultural resources at the federal, state, and local levels. The NHPA authorized the expansion and maintenance of the NRHP, established the position of State Historic Preservation Officer, and provided for the designation of State Review Boards. The NHPA also created a mechanism to certify local governments to carry out the goals of the NHPA, assisted Native American tribes to preserve their cultural heritage, and created the Advisory Council on Historic Preservation (ACHP).

SECTION 106

Section 106 of the NHPA (54 USC 306108) states that federal agencies with direct or indirect jurisdiction over federally funded, assisted, or licensed undertakings must take into account the effect of the undertaking on any historic property that is included in or eligible for inclusion in the NRHP, and that the ACHP must be afforded an opportunity to comment, through a process outlined in the ACHP regulations in 36 Code of Federal Regulations (CFR) 800, on such undertakings. The Section 106 process involves identification of significant historic resources within an "area of potential effect [APE]; determination if the undertaking will cause an adverse effect on historic resources; and resolution of those adverse effects through execution of a Memorandum of Agreement." In addition to the ACHP, interested members of the

public, including individuals, organizations, and agencies (such as the California Office of Historic Preservation) are provided with opportunities to participate in the process.

NATIONAL REGISTER OF HISTORIC PLACES

The NRHP was established by the NHPA as "an authoritative guide to be used by Federal, State, and local governments, private groups and citizens to identify the Nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment" (36 CFR 60.2). The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must also possess integrity of location, design, setting, materials, workmanship, feeling, and association.

Significance

A property is eligible for the NRHP if it is significant under one or more of the following criteria:

- **Criterion A:** It is associated with events that have made a significant contribution to the broad patterns of our history;
- **Criterion B:** It is associated with the lives of persons who are significant in our past;
- **Criterion C:** It embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; and/or
- **Criterion D:** It has yielded, or may be likely to yield, information important in prehistory or history. Ordinarily cemeteries, birthplaces, or graves of historic figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, and properties that are primarily commemorative in nature, are not considered eligible for the NRHP, unless they satisfy certain conditions. In general, a resource must be 50 years of age to be considered for the NRHP, unless it satisfies a standard of exceptional importance.

Integrity

In addition to meeting these criteria, a property must retain historic integrity, which is defined in National Register Bulletin 15 as the "ability of a property to convey its significance" (National Park Service 1990). In order to assess integrity, the National Park Service recognizes seven aspects or qualities that, considered together, define historic integrity. To retain integrity, a property must possess several, if not all, of these seven qualities, which are defined in the following manner in National Register Bulletin 15:

- **Location:** the place where the historic property was constructed or the place where the historic event occurred;
- **Design:** the combination of elements that create the form, plan, space, structure, and style of a property;
- **Setting:** the physical environment of a historic property;
- **Materials:** the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property;
- **Workmanship:** the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory;

- **Feeling:** a property's expression of the aesthetic or historic sense of a particular period of time; and/or
- **Association:** the direct link between an important historic event or person and a historic property.

State Regulations

The California Office of Historic Preservation, a division of the California Department of Parks and Recreation, is responsible for carrying out the duties described in the California Public Resources Code (PRC) and maintaining the California Historic Resources Inventory and California Register of Historical Resources (CRHR). The state-level regulatory framework also includes CEQA, which requires the identification and mitigation of substantial adverse impacts that may affect the significance of eligible historical and archaeological resources.

California Environmental Quality Act

CEQA requires a lead agency to analyze whether historic and/or archaeological resources may be adversely impacted by a proposed project. Under CEQA, a "project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment" (PRC Section 21084.1). Answering this question is a two-part process: first, the determination must be made as to whether the proposed project involves cultural resources. Second, if cultural resources are present, the proposed project must be analyzed for a potential "substantial adverse change in the significance" of the resource.

HISTORICAL RESOURCES

According to State CEQA Guidelines Section 15064.5, for the purposes of CEQA, historical resources are:

(1) A resource listed in, or formally determined eligible…for listing in the CRHR (PRC 5024.1, California Code of Regulations [CCR] Title 14, Section 4850 et seq.).

(2) A resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significance in a historic resources survey meeting the requirements of PRC Section 5024.1(g).

(3) Any object, building, structure, site, area, place, record, or manuscript that the lead agency determines to be eligible for national, state, or local landmark listing; generally, a resource shall be considered by the lead agency to be historically significant (and therefore a historic resource under CEQA) if the resource meets the criteria for listing on the CRHR (as defined in PRC Section 5024.1, Title 14 CCR, Section 4852).

Resources nominated to the CRHR must retain enough of their historic character or appearance to convey the reasons for their significance. Resources whose historic integrity (as defined above) does not meet NRHP criteria may still be eligible for listing in the CRHR.

According to CEQA, the fact that a resource is not listed in or determined eligible for listing in the CRHR or is not included in a local register or survey shall not preclude the lead agency from determining that the resource may be a historical resource (PRC Section 5024.1). Pursuant to CEQA, a project with an effect that may cause a substantial adverse change in the significance of a historical resource may have a significant effect on the environment (State CEQA Guidelines Section 15064.5[b]).

Substantial Adverse Change and Indirect Impacts to Historical Resources

The State CEQA Guidelines specify that a "substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired" (State CEQA Guidelines Section 15064.5). Material impairment occurs when a project alters in an adverse manner or demolishes "those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion" or eligibility for inclusion in the NRHP, CRHR, or local register. In addition, pursuant to State CEQA Guidelines Section 15126.2, the "direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects."

The following guides and requirements are of particular relevance to this study's analysis of indirect impacts to historic resources. Pursuant to State CEQA Guidelines (Section 15378), study of a project under CEQA requires consideration of "the whole of an action, which has the potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment." State CEQA Guidelines (Section 15064(d)) further define direct and indirect impacts:

(1) A direct physical change in the environment is a physical change in the environment, which is caused by and immediately related to the project.

(2) An indirect physical change in the environment is a physical change in the environment which is not immediately related to the project, but which is caused indirectly by the project. If a direct physical change in the environment in turn causes another change in the environment, then the other change is an indirect physical change in the environment.

(3) An indirect physical change is to be considered only if that change is a reasonably foreseeable impact, which may be caused by the project.

ARCHAEOLOGICAL RESOURCES

In terms of archaeological resources, PRC Section 21083.2(g) defines a "unique archaeological resource" as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

(1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

(2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.

(3) Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If it can be demonstrated that a proposed project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (PRC Sections 21083.2[a], [b], and [c]). CEQA notes that, if an archaeological resource is neither a unique archaeological resource nor a historical resource, the effects of the project on those resources shall not be considered to be a significant effect on the environment (State CEQA Guidelines Section 15064.5[c][4]).

California Register of Historical Resources

Created in 1992 and implemented in 1998, the CRHR is "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Sections 21083.2 and 21084.1). Certain properties, including those listed in or formally determined eligible for listing in the NRHP and California Historical Landmarks numbered 770 and higher, are automatically included in the CRHR. Other properties recognized under the California Points of Historical Interest program, identified as significant in historical resources surveys, or designated by local landmarks programs, may be nominated for inclusion in the CRHR. According to PRC Section 5024.1(c), a resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:

- **Criterion 1:** It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- **Criterion 2:** It is associated with the lives of persons important in our past.
- **Criterion 3:** It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- **Criterion 4:** It has yielded, or may be likely to yield, information important in history or prehistory.

Resources nominated to the CRHR must retain enough of their historic character or appearance to convey the reasons for their significance. Resources whose historic integrity does not meet NRHP criteria may still be eligible for listing in the CRHR.

Treatment of Human Remains

The disposition of burials falls first under the general prohibition on disturbing or removing human remains under California Health and Safety Code (CHSC) Section 7050.5. More specifically, remains suspected to be Native American are treated under CEQA in 14 CCR 15064.5; PRC Section 5097.98 illustrates the process to be followed in the event that remains are discovered. If human remains are discovered during construction, no further disturbance to the site shall occur, and the County Coroner must be notified (14 CCR 15064.5; PRC 5097.98).

Local Regulations

Monterey Peninsula Airport District

The Monterey Peninsula Airport District (MPAD) was created in March 1941 by the California State Legislature, pursuant to Senate Bill No. 1300. It was created as the public entity responsible for managing and operating the airport and its land. MPAD is overseen by a five-member Board of Directors, who are elected to serve 4-year terms. MPAD extends to include the cities of Monterey, Pacific Grove, Carmel-by-the-Sea, and Del Rey Oaks, as well as portions of Sand City and Seaside.

NATURAL SETTING

The project study area is at an elevation of approximately 200 feet above mean sea level. Of the 182-acre study area, approximately 45 acres are paved with existing runway and taxiways, buildings, and roads. A review of the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) Soils Survey revealed soils at this area of the airport consist of Baywood fine sand (2–15% slopes), which is a deep excessively drained soil occurring on slopes and stabilized dunes formed by windblown sand (NRCS 2015). Typically, Baywood fine sand supports chaparral and oak woodland communities.

Fauna that historically inhabited the project area included black-tailed deer (*Odocoileus hemionus columbianus*), bobcat (*Lynx rufus*), black-tailed jackrabbit (*Lepus californicus*), cottontail rabbit (*Sylvilagus* spp.), black bear (*Ursus americanus*), and grizzly bear (*Ursus horribilis*), as well as other small mammals, reptiles, amphibians, and birds. Shellfish such as California mussel (*Mytilus californianus*) and Pacific littleneck clam (*Protothaca staminea*) have been available near the project area on the coast. Marine mammals in the vicinity include California sea lion (*Zalophus californianus*), harbor seal (*Phoca vitulina*), and sea otter (*Enhydra lutris*).

CULTURAL SETTING

Prehistoric Overview

Understanding the prehistoric setting of the region helps predict the frequency and types of archaeological resources that may be identified. Knowing each period's characteristic artifact types allows one to assign an age to and interpret newly discovered resources. Based on geologic setting, biological setting, and geographic locations of previously recorded cultural resources, many areas are sensitive for the discovery of prehistoric archaeological resources. The six prehistoric periods of Central Coast occupation and cultural development are Paleo-Indian, Millingstone, Early, Middle, Middle-Late Transition, and Late (Jones et al. 2007:134).

Paleo-Indian Period (pre-8000 cal B.C.)

To date, sites or isolated artifacts that confirm habitation of the Central Coast region before 8000 cal (calibrated radiocarbon date) before Christ (B.C.) (during the end of the Pleistocene) have not been identified. However, human presence in the Central Coast region before 8000 cal B.C. (perhaps as long as 13,000 years ago) is suggested by discoveries of fluted projectile points from the southern portion of the Central Coast at Nipomo and at CA-SLO-1429 near Santa Margarita (Jones et al. 2007:135). While undated, the style of these points suggests a Paleo-Indian age.

Millingstone Period (8000 to 3500 cal B.C.)

Millingstone period deposits of the Early Holocene are characterized by the initial appearance of handstones and milling slabs ("milling stones"), which are associated with seed processing. Flaked tools are also apparent in these assemblages, including large side-notched points and cobble-core tools. Faunal remains suggest that Millingstone subsistence featured a wide range of animals such as shellfish, fish, birds, and land mammals including deer and rabbits, but in terms of volume, Millingstone diets consisted of 70 to 84 percent marine-derived food, particularly shellfish. At least 42 Central Coast sites feature a Millingstone period occupation. Although these are found over a wide range of geographical settings (open rocky coasts, sloughs, bays, and the interior valleys of the Coast Ranges), most known Millingstone occupations in the region occur on the coast (Jones et al. 2007:136).

Early Period (3500 to 600 cal B.C.)

The Early period of the Middle Holocene reflects new settlements that began circa 3500 to 3000 cal B.C. Breschini and Haversat (2004) have suggested that the Early period begins in 4000 cal B.C. and should be divided into two subphases. Phase I features the retention of Millingstone characteristics, while Phase II (2000 cal B.C. to 600 cal B.C.) features a pronounced increase in stemmed points and the introduction of mortars and pestles and Class L beads (rectangular Olivella beads). This split is supported by the assemblages of at least four Monterey County sites and may be supported as more post-2000 cal B.C. deposits are discovered.

The Early period is characterized by a great frequency of large projectile points and other bifaces, including relatively narrow contracting-stemmed points, wider Rossi square-stemmed points, and side-notched points of the type found in Millingstone deposits. The use of cobble-core tools continues through this period but in lower frequencies. Portable mortar and pestles appear in Early period assemblages but are infrequent. Burials from site CA-MNT-391 show a preference for flexed (bent) position and contained Rossi square-stemmed projectile points, fish gorges, and Class L beads. Bipointed bone gorges associated with line fishing appear during the Early period, and fish remains are more apparent in Early period assemblages than in Millingstone assemblages (Jones et al. 2007:138). Most Early period faunal assemblages feature deer, although a site at Morro Bay (CA-SLO-165) contains a large number of rabbit bones and site CA-MNT-391 has a preponderance of sea otters.

Middle Period (600 cal B.C. to cal A.D. 1000)

The Middle period of the Early Holocene manifestation of the Hunting Culture features the continuation of the contracting-stemmed points and the disappearance of the square-stemmed and large-notched types. The Olivella bead Type G2 (a saucer type) outnumbers the L type during this period. Ground stone features both handstones and milling slabs and mortar and pestles. Bone gorges are still apparent, and circular shell fishhooks appear for the first time. Fish remains are markedly more apparent in Middle period assemblages than in Early period ones. Mammal remains from Middle period sites vary from site to site and include northern fur seals and sea otters. In some Middle period sites, rabbit remains predominate, while, in others, deer remains prevail. Grooved stone net weights are seen in Middle period assemblages. Burials continue to show the flexed position and are sometimes accompanied by bone flutes. Bone tubes and large quantities of Type G2 beads are present in burials of this period. Type G1 Olivella saucer beads also appear. Shell bead types can be chronological indicators when types are compared within a region. At the end of this period, small leaf-shaped projectile points appear, indicating the advent of bow and arrow use (Bennyhoff and Hughes 1987).

Middle-Late Transition (cal A.D. 1000 to 1250)

Marked changes in Central Coast assemblage and settlement patterns occur after circa Anno Domini (A.D.) 1000, at the beginning of the Late Holocene. Assemblages feature a large number of the arrow points that appear at the end of the Middle period, as well as a new bead type, the Class K cupped Olivella bead. These developments help identify assemblages from this period. Fewer stemmed points appear in assemblages, but Class G1 and G2 beads are still found in assemblages of this period. Overall, the Hunting Culture that includes the Early, Middle, and Middle-Late Transition periods sees an increase in the exploitation of fish. The exploitation of shellfish is apparent at all coastal sites but seems to decrease, while the hunting of vertebrates increases. Radiocarbon dates indicate that the exploitation of acorns may have occurred during the Hunting Culture (Jones et al. 2007:138).

Late Period (cal A.D. 1250 to 1769)

Late period assemblages are distinct from those of previous periods because of a preponderance of Desert side-notched and Cottonwood projectile points, small bifacial bead drills, bedrock mortars, hopper mortars, Class E lipped Olivella beads and Class K beads, and steatite disk beads. However, Breschini and Haversat (2004) put forth that Desert side-notched points appeared after contact in the Monterey Peninsula area. Sites in the Santa Cruz area and the Monterey Peninsula feature thin, rectangular Class M beads and small, serrated arrow points. Circular shell fishhooks persist through the Late period (Breschini and Haversat 2004; Jones et al. 2007:140). Inland Late period sites are more prevalent in the archaeological record than coastal Late period sites. Many Late period sites that have been recorded feature bedrock mortars and associated middens, which may indicate a greater reliance on plant-based foods. Prehistoric inhabitants of California processed plant-based foods such as seeds (including acorns) in bedrock mortars. However, the Monterey Peninsula features dense deposits of whole abalone shells from this period that have been interpreted as abalone collecting and processing sites used by inland inhabitants (Jones et al. 2007:140). Residential features (circular house floors approximately 3 to 4 meters in diameter) have been recorded on the coast and inland.

Ethnographic Overview

The numerous Costanoan social groups in this region were organized by tribelets, each of which could have several villages or a main village with a number of camps (Levy 1978:487). Tribelets were also political units that were structured by similarities in language and ethnicity, each holding claim to a designated portion of territory. Topographic features, such as rivers, watersheds, and ridgelines, defined tribelet territories and the boundaries were strictly respected.

The study area was historically occupied by the tribelets of the Costanoan linguistic group (Levy 1978). Descendants of Costanoan speakers prefer to be called by the name of the tribelet from which they are descended, such as Mutsun or Rumsen. When their heritage is mixed or the specifics have been lost over generations, descendants prefer the use of the native term *Ohlone*, rather than the European-imposed term Costanoan (“coastal dwellers”) (Margolin 1978).

Costanoan territory extended between the Carquinez Strait and San Pablo Bay on the north, southward along the coast beyond Monterey Bay to Carmel Valley, and inland to the coast range (Levy 1978:485). Neighboring groups included the Coast Miwok north across the Carquinez Strait, the Miwok and Northern Valley Yokuts to the east, and the Salinan and Esselen to the south.

Spanish mission records, diaries, and journals provide most of the information about the Costanoans because little ethnographical research has been conducted in the twentieth century (Levy 1978:495). The most thorough study, by Milliken (1995), used mission records, and Margolin (1978) reconstructed Native American life in the Bay Area.

Linguistically, these tribelets belong to the Utian, or Miwok-Costanoan language family, part of a hypothesized larger Penutian linguistic stock (Mithun 2001:309). The Costanoan family is broken down into four branches: the Karkin, in the Carquinez Strait area; the Northern Costanoan, consisting of the Chocheno (with four dialects), Ramaytush, Tamyen, and Awaswas languages; the Soledad, seen only in Cholon; and the Southern Costanoan branch, consisting of Rumsen (with Carmel and Monterey dialects) and Mutsun (Mithun 2001:535). Speakers of these languages and dialects, in various configurations, have been treated as tribes in the past (Levy 1978:Figure 1) in accordance with anecdotal reports. Through detailed examination of mission records, marriage patterns, and dialect variation seen in personal names, Milliken (1995:229) delineated 43 separate political entities (tribelets) in the San Francisco Bay, Santa

Cruz, and inland area, with another six or so tribelets in the south Monterey Bay and Carmel Valley region.

According to historic accounts, the *kalenta ruk* tribelet of the Mutsun branch occupied the Monterey Peninsula near the study area (Levy 1978:485). The Spanish designation for this tribelet was San Carlos. Mutsun speakers occupied the lands inland from the coast around the Pajaro and upper Salinas rivers, and numbered approximately 2,700 in 1770.

Each tribelet's territory contained a main village and smaller satellite villages. The villages were typically situated along a river or stream for easy access to water (Levy 1978:487). Coastal people did not build right on the shoreline, but usually on an overlooking bluff. Dwellings were domed structures consisting of a tule- or grass-covered framework of poles, with a rectangular doorway and central hearth (Levy 1978:492). The forest-dwelling Rumsen group also constructed conical houses of split redwood and redwood bark. Villages often contained specific enclosures for dancing. Assembly halls in the center of the settlement were common; some halls were large enough to contain the entire village population of 200 people. Each community had a sweat lodge, placed near a stream. The Costanoans either buried or cremated the deceased, sometimes depending on firewood availability. There is no mention of cemeteries associated with villages (Levy 1978:490–491).

The rich resources of the ocean, bays, valleys, and mountains provided Ohlone-speaking peoples with food and all their material needs (Levy 1978:491–492). The primary food staple was the acorn, supplemented by a great variety of animal and plant resources. Depending on species availability and desirability, Costanoans used four oak species, including coast live, valley, tanbark, and black. Collected nuts included buckeye, laurel, pine nuts, and hazelnuts. Seeds from dock, chia, and other salvias; tarweed; and holly-leaf cherry were collected and ground into meal. Vegetal resources also included several berry-producing plants, wild onions, carrots, tule roots, and greens of clover and other annuals. Large and small game, including deer, elk, antelope, bear, mountain lion, raccoon, ground squirrels, woodrat, mouse, mole, dog, rabbit, and jackrabbit, plus seals and stranded whales were part of their diet. Migrating waterfowl were an important resource, and included geese, ducks, and coots. Pigeons, quails, and hawks were also consumed, but not eagles, owls, ravens, or turkey vultures. Rivers and streams provided freshwater fish, including steelhead, salmon, and sturgeon, while the ocean provided shark, sardine, and lampreys. Costanoan diet also included a variety of insects and reptiles, but not amphibians.

For hunting and gathering natural resources, Costanoans used a wide array of tools, implements, and enclosures. Among those used for hunting land mammals and birds were bows and arrows, traps and snares, deer-head disguises, bolas, nets and net sinkers, and enclosures/blinds. Communal hunting drives were used to catch rabbits, whereas nets and poisons were used to harvest fish. Tule watercraft were used for transportation and for hunting fish and waterfowl on enclosed bays and marshes. Many plants were collected using wooden tools: long poles for dislodging acorns and pinecones, fire-hardened digging sticks for obtaining roots, and beaters for dislodging seeds. Once collected, seeds, roots, and nuts were placed in burden baskets and transported for processing or storage (Levy 1978:491).

Costanoans used a variety of tools to process food resources. These tools included portable stone mortars and pestles, bedrock mortars, hopper mortars, anvils, woven strainers and winnowers, leaching and boiling baskets, woven drying trays, and knives. Various foods were baked in earthen ovens. Wooden paddles were carved for stirring food in the boiling baskets. There were shell spoons, basket dippers, and mush bowls for serving food, and woven water jugs and storage containers for keeping food afterwards.

The presence of exotic items such as obsidian, steatite, and shell indicates Costanoan tribelets traded with coastal groups and mountain tribes (Levy 1978:493). Dietary items were also traded with the Plains Miwok, Sierra Miwok, and Yokuts. Costanoans provided mussels, abalone shells, dried abalone, and salt

to the Yokuts and Olivella shells to the Miwok. They received pine nuts from the Yokuts, but other food resources received by the Costanoan tribelets are unrecorded.

The Native American population in this region came into contact with European culture at the beginning of Spain's land exploration and settlement in A.D. 1769. Traditional lifeways were altered drastically during the late 1700s to early 1800s when the Spanish placed their capital at Monterey, built forts at Monterey and San Francisco, and established seven Franciscan missions to convert native peoples to Christianity and the European way of life. Large-scale epidemics soon swept through the mission population and remaining villages (Milliken 1995). Subsequent Spanish colonial towns at Santa Cruz and Yerba Buena (San Francisco), followed by large Mexican land grants, separated Costanoans from their harvesting grounds and hunting parks. Many surviving Native Americans were pulled away from their own villages to the new Euro-American settlements. It is estimated that the combined Costanoan population fell from a pre-contact total of 10,000 down to 2,000 by the end of the mission period in 1834 (Levy 1978:486). During the mission period, the dwindling Costanoan population also intermarried with other interior tribes at the missions, mixing their cultural identities.

During the late 1800s, several Native American communities of mixed heritage remained in rural areas, with Pleasanton, Monterey, and San Juan Bautista the best known (Levy 1978:487). Even these groups continued to shrink as young people married into other groups and moved away. Estimates of the total remaining population of people with recognizable Costanoan descent were fewer than 300 in 1973 (Levy 1978:487). According to Levy: "In 1971 descendants of the Costanoan united in a corporate entity, the Ohlone Indian Tribe, and received title to the Ohlone Indian Cemetery where their ancestors who died at Mission San José are buried" (Levy 1978:487).

Since that time, other descendants of Costanoan tribelets, notably the Rumsen and Mutsun groups, have organized political and cultural heritage organizations that are active locally and statewide. All are concerned with revitalizing aspects of their culture, learning the language through notes collected by anthropologist John Harrington, and preserving the natural resources that played a vital role in traditional culture. Some Costanoan groups also are seeking federal recognition of their tribe, petitioning the Bureau of Indian Affairs with reconstructed tribal histories and genealogies, records that will be a great resource for future generations of Costanoans. These groups include the Amah-Mutsun Band of Mission Indians, Costanoan Band of Carmel Mission Indians, Costanoan Rumsen Carmel Tribe, Indian Canyon Mutsun Band of Costanoan, and Muwekma Ohlone Tribe.

Historic Overview

Post-contact history for the state of California generally is divided into three periods: the Spanish period (1769–1822), the Mexican period (1822–1848), and the American period (1848–present). Although there were brief visits by Spanish, Russian, and British explorers between 1529 and 1769, the beginning of Spanish settlement in California occurred in 1769 with the establishment of Mission San Diego de Alcalá. This was the first of 21 missions established between 1769 and 1823. After the end of the Mexican Revolution against the Spanish crown (1810–1821), all Spanish holdings in North America (including both Alta and Baja California) became part of the newly formed Mexican Empire, and shortly thereafter, a constitutionally based United Mexican States. Under Mexican rule, the authority of the California missions gradually declined, culminating with their secularization. The Mexican period is marked by an extensive era of land grants, most of which were in the interior of the state, and by exploration by American fur trappers west of the Sierra Nevada Mountains.

With the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican–American War, California became a territory of the United States. The discovery of gold in 1848 at Sutter's Mill near Sacramento and the resulting Gold Rush era influenced the history of the state and the nation. The rush of

tens of thousands of people to the gold fields also had a devastating impact on the lives of indigenous Californians, with the introduction and concentration of diseases, the loss of land and territory (including traditional hunting and gathering locales), violence, malnutrition, and starvation. Thousands of settlers and immigrants continued to pour into the state, particularly after the completion of the transcontinental railroad in 1869.

With continued growth, California continues to be a national leader in agriculture and poultry production, ranching (cattle and sheep), and aerospace and communications industries, as well as the film and entertainment business. The wealth of California's natural resources (e.g., lumber, petroleum deposits, minerals, fish) also continues to contribute to its growth and development.

Monterey County

Juan Rodríguez Cabrillo was the first European to sail along today's Monterey County coast in 1542 (Hoover et al. 2002:225; Gudde 1998:246). Sixty years passed after Cabrillo's 1542 voyage, before Sebastián Vizcaíno harbored in the bay in 1602 near the present city of Monterey. In 1769, Gaspar de Portolá was sent from Mexico City to locate the port described by Vizcaíno, and the Spanish presidio and mission (San Carlos de Monterey) were established in 1770. The mission was the second established in California, after San Diego de Alcalá in 1769, but the following year it was moved south to its present site in Carmel. Renamed San Carlos Borromeo de Carmelo, it served as headquarters for the mission chain from 1770 until 1803. It is also the resting place for Father Junípero Serra, founder of the California missions (Johnson 1979:83).

Monterey County was one of California's original 27 counties, established in 1850. The governmental seat was initially located in the town of Monterey, but was relocated to Salinas in 1873, where it has remained. The town of Monterey was named the capital of "Las Californias" (upper and lower California) in 1774, and 3 years later became the official capital of Alta (upper) California. The city remained the capital during Spanish and Mexican rule. Many of the Spanish colonial structures built around Monterey's Old Town Historic District are listed on the NRHP. The Larkin House, built in 1834, is a National Historic Landmark, and the Cooper-Molera adobe, built in 1826, is one of the largest extant adobe buildings remaining in northern California. Several other historic buildings give the town an old Spanish/Mexican appearance.

There are two Franciscan missions in the Salinas Valley area—Mission San Antonio de Padua in the community of Jolon and Mission Nuestra Señora de la Soledad in the city of Soledad. Mission San Antonio is now within the Fort Hunter Liggett Military Installation, southwest of King City in southern Monterey County. It was established in 1771, the third mission to be founded after those at San Diego and Monterey. Mission San Antonio was moved to its present location in 1773. The mission in the town of Soledad was founded in 1791, the thirteenth of the 21 missions established by the Spanish.

Monterey Bay has a long history as a military focus, fishery, and seaside resort. Although the Spanish Presidio is long gone, the Naval Postgraduate School, a Coast Guard station, and the Defense Language Institute now grace its shores. Slightly east of the bay, the U.S. Army established Ford Ord in 1917 as a maneuver and field artillery target range. The base was closed in 1994 and is now the home of the California State University, Monterey Bay.

Monterey Regional Airport

The same patterns of development that drove early development in Monterey—such as the growth of tourism and the defense- and military-related presence in the area—figured prominently in the establishment and expansion of MRY. In the 1930s, land formerly held by Del Monte Properties was

deeded to the City of Monterey, and, with funding provided by the Great Depression-era Works Projects Administration, an airport was constructed; the original configuration included two runways and a hangar (SWCA 2014).

During World War II, MRY served as one of a number of auxiliary airfields to Naval Air Station Alameda. Following the war, commercial passenger flights resumed and in 1948, construction of a new terminal began. Inaugurated in the fall of 1950 and ultimately constructed for $245,000, the terminal spanned 15,000 square feet and was promoted as serving the communities of Monterey, Carmel, and Watsonville. Over the years, in order to accommodate growth at the airport, substantial additions were made to the terminal and the current footprint spans approximately 70,000 square feet (SWCA 2014).

PRE-FIELD RESEARCH

Records Search

On June 2, 2014, staff at the Northwest Information Center (NWIC) at Sonoma State University, Rohnert Park, California, conducted a California Historical Resources Information System (CHRIS) records search of the entire airport property and a 0.25-mile radius. SWCA obtained supplemental records search results on October 22, 2015. The purpose of the records searches was to identify previously recorded prehistoric or historic cultural resources, including isolated artifacts, archaeological sites, historical buildings, and structures that are in the study area. The results of the records searches are presented in Appendix A. The NWIC consulted the following sources of information, along with official maps and records:

- National Register of Historic Places
- California National Register of Determined Eligible Properties
- California State Historic Property Data Files
- California State Historical Landmarks
- California Points of Historical Interest
- California Office of Historic Preservation Archaeological Determinations of Eligibility
- California Department of Transportation (Caltrans) State and Local Bridge Surveys

Previous Cultural Resources Studies

The NWIC records search revealed that 22 cultural resources studies have been conducted within a 0.25-mile radius of the study area. Four of these previous studies—S-005882, S-029625, S-037231, and S–045490—directly overlap with the current study area (Figure 3; Table 1):

- S-005882 included archival research and a pedestrian survey of the northern portion of the airport property;
- S-029625 included archival research and a pedestrian survey for a proposed road improvement project;
- S-037231 included archival research and pedestrian survey for the Runway Safety Area (RSA) Improvement Project (SWCA 2010); and

- S-045490 (SWCA 2014) included archival research and a field survey to document built environment resources within and near the airport; however, it did not address archaeological resources (Appendix A).

Aside from P-27-1459 (discussed in the following section), none of these studies identified significant cultural resources within or adjacent to the study area.

In addition, SWCA reviewed technical reports recently prepared for data recovery, field survey, and construction monitoring efforts for multiple projects on the Airport, which were provided by Pacific Legacy, Inc.:

- *Cultural Resources Monitoring for the Solar Array Project, Airport District Property, Monterey County, California* (O'Neill 2017); and
- *Data Recovery Report for Portions of CA-MNT-1438/H, Monterey Peninsula Airport District, Monterey County* (Holm et al. 2016).

Previously Recorded Archaeological Resources

The CHRIS records search revealed that three previously identified archaeological sites (P-27-88, P-27-90, and P-27-908) are within 0.25 mile of the study area, and one prehistoric archaeological resource (P-27-1459) is within the study area (Figure 4). P-27-88/CA-MNT-1799H is a historic trash dump, P-27-90/CA-MNT-1801H is the remnants of a historic structure, and P-27-908/CA-MNT-842 is a prehistoric midden with bedrock mortar features. All three are located outside of the airport property and south of SR 68.

Previously identified resource P-27-1459 originally consisted of the historic Ryan House (also identified as Rancho Saucito and currently as Tarpy's Restaurant), an NRHP- and CRHR-eligible resource (SWCA 2014). However, according to the NWIC, what was formerly and separately identified as P-27-000803 (CA-MNT-728)—a large prehistoric habitation site consisting of shell midden, a lithic scatter, and purportedly, human remains—was subsumed by P-27-1459. As such, they are now considered a single resource by the NWIC.

A portion of CA-MNT-1438/H was encountered during construction monitoring for the MRY RSA Improvement Project. As the portion of the archaeological site could not be avoided, it was assumed eligible for the NRHP/CRHR, and Pacific Legacy, Inc. undertook a data recovery program to mitigate impacts to the site. Following mitigation through data recovery, the portion of the site within the RSA's direct APE (which overlaps with the current study area) was entirely destroyed by project-related excavations. Data recovery excavations revealed a diverse prehistoric assemblage with multiple subsurface features, and human remains. In addition, all site-associated soils were excavated and relocated to an area on the airport known to not contain archaeological resources (Holm et al. 2016). This location is outside of any currently proposed projects associated with the AMP, but is within the study area (Figure 4).

Exact location of identified resources is not disclosed to protect resource integrity.

This page left intentionally blank.

Previously Recorded Built Environment Resources

In 2014, SWCA completed a historic resources survey and evaluation of MRY to identify airport properties that appeared eligible for national, state, or local designation, either individually or as part of a historic district (SWCA 2014). Methods included a CHRIS records search of the airport property, an intensive level survey and evaluation of built environment resources aged 45 years or older, and completion of a technical report summarizing the results. As a result of the study, 21 properties were subject to intensive-level survey. Research conducted in support of the study identified two principal themes of significance for the airport: (1) World War II era, defense-related development; and (2) the early history and development of aviation on the Monterey Peninsula. While a number of properties on the airport were found to reflect these themes of significance, only one of the surveyed properties appeared eligible for national, state, or local landmark listing: Tarpy's Roadhouse/Ryan House, constructed between 1919 and 1925 on the southeastern portion of the airport property (prior to the development of the airport). For airport-related properties, ineligibility was primarily due to significant alterations. With the exception of Tarpy's Roadhouse/Ryan House, none of the surveyed properties appear eligible for national, state, county, or local listing under other applicable criteria, either individually or as contributors to historic districts.

Since the entire airport was considered in 2014, five buildings have come of age: Buildings 72, 99, 102, 104, and 106, all of which were constructed in 1970. SWCA conducted a supplemental built environment study, which included evaluation of four of the five aforementioned buildings (the fifth, Building 72, was found to be demolished) (SWCA 2017). None of the four recently evaluated buildings are eligible on their own, or as contributing elements to a district, at a national, state, or local level for the NRHP or CRHR. Further, Tarpy's Roadhouse/Ryan House (P-27-1459), the only eligible resource identified during the 2014 study, is located approximately 175 feet from the study area and does not have the potential to be impacted by the future airport development.

In addition to historic resources identified on the airport property, the CHRIS records search revealed that one additional historic building (P-27-2846) is within 0.25 mile of the study area. This resource was recommended ineligible for the NRHP, is outside of the airport property, and warrants no further consideration for the AMP.

FIELD SURVEY

SWCA conducted an intensive-level pedestrian survey of the 182-acre study area (Figure 5). Mr. Laurie and Mr. Jackson examined all areas of exposed ground surface for prehistoric artifacts (e.g., chipped stone tools and production debris, stone milling tools), historic artifacts (e.g., metal, glass, ceramics), soil discoloration that might indicate the presence of a cultural midden, linear features, soil depressions, and other features indicative of the former presence of historic structures or buildings (e.g., foundations). Aside from paved areas, all areas were subject to pedestrian survey. Approximately 50 percent of the study area had zero to less than 25 percent visibility. The remainder of the study area had poor to good (25 percent to 75 percent) visibility. In areas of poor visibility, the ground was cleared using boot or trowel at regular 20-meter intervals to inspect the surface for the presence of cultural resources. Total survey coverage included 137 acres of the 182-acre study area (Figure 5). Paved areas and those obscured by existing improvements were not subject to pedestrian survey (approximately 45 acres of the overall 182-acre study area). Photo documentation of the study area is included in Appendix B.

FINDINGS

Archival research revealed that the entire study area has been subject to some level of cultural resources study, including both architectural surveys and evaluations, archaeological surveys, archaeological monitoring, and archaeological data recovery. Several historic-era buildings are located within the study area; however, all but one (P-27-1459, Tarpy's Restaurant) have been determined ineligible for either the NRHP or CRHR. Likewise, only one previously identified archaeological site is within the study area, which is the prehistoric component of P-27-1459 (CA-MNT-1438/H).

A portion of CA-MNT-1438/H was encountered during construction monitoring for the MRY RSA Improvement Project. As the portion of the archaeological site could not be avoided, it was assumed eligible for the NRHP/CRHR, and Pacific Legacy, Inc. undertook a data recovery program to mitigate impacts to the site. As previously stated, following mitigation through data recovery, the portion of the site within the RSA's direct APE (which overlaps with the current study area) was entirely destroyed by project-related excavations. Data recovery excavations revealed a diverse prehistoric assemblage with multiple subsurface features, and human remains. In addition, all site associated soils were excavated and relocated to an area on the airport known to not contain archaeological resources (Holm et al. 2016). This location is outside of any currently proposed projects associated with the AMP, but it is within the study area (Figure 6).

Cultural resources survey of the study area revealed the airport is heavily disturbed from its original construction and subsequent historic and modern development. Dozens of historic-era buildings, structures, and access routes associated with mid-twentieth century development of the airport resulted in extensive earth movement and modification of the native landscape. Historic aerials and maps depict a vast network of no longer extant historic features in the northern and northwestern portions of the study area (SWCA 2014) that have been demolished and removed from the airport property. Remnants of this earlier development include existing roads and access routes. In addition, the field survey identified a concrete foundation and associated concrete debris in the northern portion of the study area, designated MRY-HIST-001 (see Figure 6; Appendix C). Historic archaeological site MRY-HIST-001 consists of the foundational remnants of a target shooting range facility (personal communication with Chris Morello, MRY Project Manager, via email on April 10, 2018). The foundation is partially demolished, as evidenced by concrete debris piles adjacent to the site. Although partially obscured by dense vegetation, the visible portion of the foundation measures approximately 100 feet (northwest/southeast) by 35 feet (northeast/southwest) (see Appendix C).

Historic archaeological site MRY-HIST-001 is not associated with any significant events or people (Criterion A/1 and B/2), the foundation is a typical example of construction type and material (Criterion C/2), the site does not have the ability to provide additional information regarding the history of the airport or region beyond what is already well-documented (Criterion D/4), and the site lacks integrity. As such, the site does not constitute a historical resource or historical property and warrants no further consideration.

In addition, dozens of isolated historic-era cans and bottles and miscellaneous historic-era debris (e.g., metal, glass, plastic) were observed throughout the study area, the majority was likely related to recreational use or mid-twentieth century development within the airport property. In addition, two abandoned mid-century automobiles were encountered in the southern portion of the study area, within the potential acquisition property along SR 68. Due to the lack of context, the isolated historic debris and automobiles do not warrant formal documentation beyond their mention in this report.

Aside from the aforementioned multi-component cultural resource, P-24-1459, which includes the NRHP- and CRHR-eligible Tarpy's Restaurant and archaeological site CA-MNT-1438/H, no significant cultural resources are known to occur within the study area.

RECOMMENDATIONS

Although no new, significant cultural resources were identified within the study area as a result of pedestrian survey and archival research, as with previous cultural resources studies conducted on the airport property, archaeological survey is problematic in this area due to dense vegetation cover and existing developments (e.g., runway and taxiways, buildings, roads). The pedestrian survey of the study area was conducted in a good faith effort, which included manual ground clearing at regular intervals in areas of low visibility; however, the lack of visibility, and in some cases, impenetrable vegetation creates inherent issues with negative findings. As such, the following mitigation measures are recommended for future proposed development(s) associated with the AMP:

1. Prior to project implementation, a qualified archaeologist should conduct a cultural resource awareness training for all construction personnel, which should include the following:
   - Review the types of prehistoric and historic resources that may be uncovered;
   - Provide examples of common prehistoric and historic archaeological artifacts to examine;
   - Review what makes an archaeological resource significant to archaeologists and local native Americans;
   - Describe procedures for notifying involved or interested parties in case of a new discovery;
   - Describe reporting requirements and responsibilities of construction personnel;
   - Review procedures that shall be used to record, evaluate, and mitigate new discoveries; and
   - Describe procedures that would be followed in the case of discovery of disturbed as well as intact human burials and burial-associated artifacts.
2. In the event that cultural resources are exposed during project implementation, work should stop in the immediate vicinity, and an archaeologist who meets the Secretary of the Interior's Professional Qualification Standards should be retained to evaluate the find and recommend relevant mitigation measures.
3. If human remains are encountered, then the procedures outlined by the California Native American Heritage Commission (NAHC), in accordance with CHSC Section 7050.5 and PRC Section 5097.98, would be followed. If the monitor determines that a discovery includes human remains:
   - All ground-disturbing work within the immediate vicinity of the find (50 feet) would halt.
   - The archaeologist would contact the Monterey County Coroner:
     – Monterey County Sheriff-Coroner
     1414 Natividad Road
     Salinas, CA 93906
     Phone: (831) 647-7792
   - As a courtesy, the archaeologist would also notify the NAHC:
     – Native American Heritage Commission
     915 Capitol Mall, Room 364
     Sacramento, California 95814
     Phone: (916) 373-3710
     Email: nahc@nahc.ca.gov
   - The coroner would have 2 working days to examine the remains after being notified in accordance with CHSC Section 7050.5. If the coroner determines that the remains are Native American and are not subject to the coroner's authority, the coroner has 24 hours to notify the NAHC of the discovery.

- The NAHC would immediately designate and notify the Native American Most Likely Descendant (MLD), who will have 48 hours after being granted access to the location of the remains to inspect them and make recommendations for treatment of them.

4. In areas of dense vegetation that have not been subject to extensive prior disturbance, SWCA recommends that an Archaeological Monitoring Plan be developed prior to project implementation (Figure 7). The Archaeological Monitoring Plan should include (but not be limited to) the following:
   - A list of personnel involved in the monitoring activities;
   - Description of how the monitoring shall occur;
   - Description of frequency of monitoring (e.g., full time, part time, spot checking);
   - Description of what resources are expected to be encountered;
   - Description of circumstances that would result in the halting of work at the project site;
   - Description of procedures for halting work on the site and notification procedures;
   - Description of monitoring reporting procedures; and
   - Provide specific, detailed protocols for what to do in the event of the discovery of human remains.

With the implementation of the proposed mitigation measures, impacts to previously unidentified cultural resources can be potentially be avoided and/or reduced.

Unanticipated Discovery of Human Remains

The discovery of human remains is always a possibility during ground disturbances; CHSC Section 7050.5 addresses these findings. This code section states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. The County Coroner must be notified of the find immediately. If the human remains are determined to be Native American, the County Coroner will notify the NAHC within 24 hours, which will determine and notify a Most Likely Descendant (MLD). The MLD shall complete the inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials.

RE: Supplemental Historic Resources Assessment for Monterey Regional Airport, Monterey County, California / SWCA No. 37212

Dear Mr. Krauss:

In support of the Airport Master Plan (AMP), SWCA Environmental Consultants (SWCA) was retained by Coffman Associates to provide environmental consulting services consisting of a supplemental Historic Resources Assessment for the Monterey Regional Airport (Airport), Monterey County, California (project). In 2014, SWCA prepared the *Historic Resources Assessment Report, Monterey Regional Airport, Monterey, California*. Since the preparation of that study, which evaluated historic-era buildings within the Airport property, five additional buildings are now older than 45 years of age and warrant evaluation. Guidance from the California Office of Historic Preservation recognizes that there is commonly a 5-year lag between resource identification and the date that planning decisions are made, and recommends that properties that are 45 years of age or older be recorded and evaluated. To provide Coffman Associates and the Airport with data for future planning efforts, SWCA conducted a focused survey and evaluation to determine if any of the five previously unrecorded properties are eligible for national, state, or local designation, and are potentially historical resources as defined in the California Environmental Quality Act. This memorandum should be reviewed in tandem with SWCA's 2014 study. In addition, for a complete review of background and setting information, please review the aforementioned report.

METHODS

On October 20, 2016, SWCA architectural historian Nelson White conducted an intensive-level pedestrian survey of the five additional buildings (Buildings 72, 99, 102, 104, and 106) newly over 45 years of age (Table 1). During the survey, Building 72 was found to be recently demolished and was therefore, not evaluated as part of this study. The remaining four buildings were documented with digital photographs and detailed field notes, which included project setting information, site characteristics, and general observations. Background research for the building evaluations relied on the contextual historic setting presented in SWCA's 2014 study.

CONCLUSIONS

None of the four recently evaluated buildings are eligible on their own, or as contributing elements to a district, at a national, state, or local level for the National Register of Historic Places or the California Register of Historical Resources (Table 1). No further cultural resources study is warranted for these buildings. For full documentation on each building's evaluation, please see the California Department of Parks and Recreation Series 523 forms included as Attachment A.

Table 1. Monterey Regional Airport, Supplemental Assessment Results

Building #	Description of Building	Year Built	Year Modified	Square Feet	Surveyed	DPR Form Prepared	Eligibility Status
72	Car Washes (demolished)	1970 (not extant)	N/A	3,513	Y	N	N/A
99	Maintenance Building	1970	N/A	1,504	Y	Y	Not eligible
102	Tenant Building	1970	1980	6,900	Y	Y	Not eligible
104	Tenant Building	1970	1980	7,350	Y	Y	Not eligible
106	Tenant Building	1970	N/A	32,260	Y	Y	Not eligible

If you have any questions, please feel free to contact me directly at (805) 543-7095, extension 6805, or via email me at llaurie@swca.com.

Sincerely,

Leroy Laurie
Cultural Resource Specialist

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)
Building No. 99 conists of two single-story airport maintenance buildings. The larger was constructed in 1970. The construction date of the smaller building is unknown. Clad in corrugated metal siding, the buildings are rectangular in plan. The larger features a side-gable roof while the smaller features a front gable. Fenestration on the larger building includes metal slider winders, a metal door, and two industrial metal sliding doors. The smaller building's fenestration consists of a pair of metal doors. The buildings are on the immediate north side of Sky Park Drive. Two wood portable shed structures are located to the south and east of the smaller building. The grouping backs up to a forested hillside immediately to the north. No alterations are known or readily apparent. The subject property is located on a level parcel located within the southern boundary of the Monterey Regional Airport, west of the terminal building, opposite Del Monte Aviation. The property appears to be in fair condition.

***B10. Significance: Theme:** N/A **Area:** N/A
Period of Significance: N/A **Property Type:** Industrial/Airport support **Applicable Criteria:** N/A
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Building No. 99 is not eligible individually or as a contributor to a historic district under national, state, county, or local eligibility criteria. Research did not reveal that the property had a direct association with a significant event/pattern of development or important person, nor does the building represent a distinctive or rare building type or style. In terms of the themes of significance specific to the Monterey Regional Airport—first, World War II and defense-related development and use, and, second, the postwar return to civilian/commercial use—the property does not convey the significance of either theme. The continuing use and expansion of the airport over the decades brought numerous alterations, as facilities were adapted to new uses and demand. Therefore, in terms of potential significance as contributors to a historic district, overall alterations and additions resulted in a loss of historic integrity for potential historic districts reflecting these themes.

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

Building No. 104 is not eligible individually or as a contributor to a historic district under national, state, county, or local eligibility criteria. Research did not reveal that the property had a direct association with a significant event/pattern of development or important person, nor does the building represent a distinctive or rare building type or style. In terms of the themes of significance specific to the Monterey Regional Airport—first, World War II and defense-related development and use, and, second, the postwar return to civilian/commercial use—the property does not convey the significance of either theme. The continuing use and expansion of the airport over the decades brought numerous alterations, as facilities were adapted to new uses and demand. Therefore, in terms of potential significance as a contributor to a historic district, overall alterations and additions resulted in a loss of historic integrity for potential historic districts reflecting these themes.

Building No. 106 is a single-story tenant building. Constructed in 1970, the subject property houses plumbing and construction facilities. Clad in corrugated metal siding, the building is rectangular in plan and exhibits a side-gabled roof hidden by a parapet-like extension. Fenestration includes glass doors and roll-up metal doors. The building displays alphabetical signage associated with different roll-up doors identified as A–D. A wide, paved, shared driveway is located to the south of the building. There are no apparent alterations. The subject property is located on a level, corner lot within the northernmost boundary of the Monterey Regional Airport.The property appears to be in fair condition.

Date: October 4, 2016	
Present:	Chris Morello (MPAD), Louise J. Miranda Ramirez (OCEN), Shelley Glennon (MPAD), Scott Huber (District Counsel – via teleconference)
Projects:	Infield Rehabilitation Project and Airport Master Plan Initial Study/ NOP for an EIR (CEQA Review)
Meeting Location:	P&D Conference Room

I. Introduction

Attendance roll-call given: Shelley Glennon (SG) and Chris Morello (CM) with the Monterey Regional Airport (Airport), Scott Huber (SH), District Counsel, and Louise Ramirez (LR) with Ohlone/Costanoan-Esselen Nation (OCEN). Attendance sign-in sheet and meeting agenda provided to present attendees. The tribal consultation meeting was held as part of the CEQA review process and in compliance with Assembly Bill 52 (Chapter 532, Statutes of 2014) – *Tribal Cultural Resources and Consultation Requirements*.

II. Discussion

The tribal consultation meeting discussion was conducted in the order provided by the agenda items listed below.

Agenda Item 1: Mitigation under the CEQA process (Pre-Commitments not allowed).

SG presented discussion to focus on potential mitigation or other measures that can be taken to prevent any potential impacts to cultural resources, with an emphasis that staff is not able to make any pre-commitments when going through the CEQA process. SH emphasized the District will need to go through the environmental process to understand all the potential impacts of the project, so any mitigation measures discussed now, would potentially be considered premature. CM suggested further discussion on this intent as each project is presented.

Agenda Item 2: Infield Rehabilitation Project (CEQA Review)

The Airport provided LR with a project overview. LR invited for any comments/questions.

LR stated she understood the need for the project and asked that a OCEN monitor be present during any proposed soil movement. The Airport acknowledged her requested recommendation.

Agenda Item 3: Monterey Regional Airport Master Plan Initial Study/NOP EIR (CEQA Review)

The Airport provided LR with a project overview. LR invited for any comments/questions.

LR stated that she wanted to speak with the Native American Heritage Commission with regards to agency agreements early on in the process as she had not understood that pre-commitments were not allowed. The main concern is that her recommended mitigation measures would be

ignored, such as her recommendation for cultural resources found during the Runway Safety Area (RSA) project.

Further requests expressed:

1) All cultural resources be reburied rather than displayed at any museum; or

2) Cultural resources be given directly to OCEN since OCEN is planning on opening up a center to display their own cultural resources.

CM clarified the RSA project as follows: During the environmental review process of the RSA project, the Airport contacted the Native American Heritage Commission (NAHC) requesting a Sacred File search for traditional cultural resources. NAHC stated that the search failed to indicate the presence of Native American sacred lands or traditional cultural properties in the immediate vicinity and provided the Airport with a list of local tribes to contact for comment. All the tribes were contacted and none provided comment that cultural resources would be anticipated.

However, during the early stages of the RSA Construction Project, previously unrecorded archaeological materials were identified within the area of potential effects (APE) of the project. These materials included what appeared to be the residue of stone tool manufacture e.g. siltstone and chert flakes. The Federal Aviation Administration (FAA) acknowledged its responsibilities under 36 CFR 800 with the discovery of prehistoric materials during construction. Since FAA was the Lead Federal Agency for National Historic Preservation Act, Section 106 consultation with the California State Historic Preservation Officer was conducted. The FAA transmitted a Work and Treatment Plan (WTP) to all appropriate responsible parties in accordance with applicable sections of 36 CFR Part 800 Protection of Cultural Properties. That plan included standards for curation as provided for under the Archaeological Resources Protection Act (ARPA) in regulations at 36 CFR § 79 to ensure the preservation and accessibility of archaeological collections for future use and study. The FAA WTP required that archaeological material collected during this process be preserved in a curation facility as set forth in 36 CFR § 79.

With the knowledge learned from the RSA project, the Airport encourages tribal consultation early in the environmental process so that potential mitigation can be incorporated into the projects' CEQA environmental document.

The District Board of Directors are the approving body that will make the final decision on the environmental document including all mitigation measures. Staff will recommend mitigation measures in the CEQA environmental document after all analysis has been completed where appropriate.

SH clarified his opening statement discussed in agenda item 1:

1) Airport would like to get the tribe's recommendations early in the process;

2) The environmental process is required of the Airport prior to any agreements made; and

3) The tribe will provide to the Airport a written list of items they want provided/addressed for each project.

Agenda Item 4: Protecting the Confidentiality of Resources Found (AB 52)

The Airport is committed to protecting the confidentiality of cultural resources and therefore will not publish any confidential/sensitive information regarding these cultural resources or locations. SG stated the Airport would like to have agreed upon procedures with OCEN for protecting the confidentiality of any cultural resources found in order to prevent looting, vandalism or damage to cultural resources.

LR agreed with protecting the confidentiality of cultural resources found. LR is concerned that they don't receive copies of any confidential reports and would like the Airport, if possible, to provide those to them. No commitments were made by the Airport on this issue. It will be researched in more detail.

III. Conclusion

Discussion review: LR will provide the Airport with two lists to review and potentially address:

1) Current projects that were just discussed:
   A. The Infield Rehabilitation Project; and

   B. Monterey Airport Master Plan project.

2) Address follow-up questions from the RSA project cultural resources.

SG will send the meeting minutes to LR via certifiable mail and an electronic copy via email.

Finally, LR invited the Airport to attend a tribal gathering held at CSUMB on November 5th, 2016.

RE: Notice of Preparation of an Environmental Impact Report & Notice of Scoping Meeting; Initial Study; Proposed Monterey Regional Airport – Airport Master Plan at Monterey Regional Airport in Monterey, California

Dear Ms. Ramirez:

Please review the enclosed ***Notice of Preparation for an Environmental Impact Report & Notice of Scoping Meeting,*** and ***Initial Study*** for the proposed ***Monterey Regional Airport – Airport Master Plan Project ("Project").***

Pursuant to Section 15082 of the State California Environmental Quality Act ("CEQA") Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq.), the Monterey Peninsula Airport District ("District"), acting in its capacity as the owner and operator of Monterey Regional Airport, has determined that an Environmental Impact Report ("EIR") is the appropriate environmental document for the Project. The District will be the Lead Agency for the Project and will be responsible for the EIR preparation pursuant to CEQA and the State CEQA Guidelines.

Coordination with all responsible agencies will be provided in accordance with the Notice of Preparation statutes. Additionally, the Scoping Meeting will be held from 2:00PM-4:00PM at the 2nd Floor of the Airport Terminal Building- 200 Fred Kane Drive, Suite 200, Monterey, CA 93940 on Wednesday, February 3, 2016.

Please send any written comments or concerns regarding potential environmental impacts of the proposed Project addressed to me at: 200 Fred Kane Drive Suite 200, Monterey, CA 93940 or via email at sglennon@montereyairport.com by **Tuesday, February 16, 2015**. If you have any questions or need additional information, please feel free to contact me at (831) 648-7000 Ext. 209. Thank you for your consideration and timely response.

Sincerely,

Shelley Glennon

Re: CA-MNT-728 - Notice of Preparation for an Environmental Impact Report and Notice of Scoping Meeting, and Initial Study for the proposed Monterey Regional Airport - Airport Master Plan Project -

Saleki Atsa,

Ohlone/Costanoan-Esselen Nation is an historically documented previously recognized tribe. OCEN is the legal tribal government representative for over 600 enrolled members of Esselen, Carmeleno, Monterey Band, Rumsen, Chalon, Soledad Mission, San Carlos Mission and/or Costanoan Mission Indian descent. Though other indigenous people may have lived in the area, the area is the indigenous homeland of our people. Included with this letter please find a territorial map by Taylor 1856; Levy 1973; and Milliken 1990, indentifying Tribal areas.

Ohlone/Costanoan-Esselen Nation objects to all excavation in known cultural lands, even when they are described as previously disturbed, and of no significant archaeological value. Please be advised that it is our first priority that our ancestor's remains be protected and undisturbed. We desire that all cultural and sacred burial items be left with our ancestors on site or where they are discovered. We ask for the respect that is afforded all of our current day deceased, by no other word these burial sites are cemeteries, respect for our ancestors as you would expect respect for your deceased family members in today's cemeteries. **Our definition of respect is no disturbance.**

I was assigned as the Most Likely Descendant for CA-MNT-728, by the Native American Heritage Commission, we continue to wait for follow through to rebury the remains of our Ancestors found on site. There has been no contact as to the return of artifacts found on CA-MNT-728 as agreed by the airport management. I have noticed with this report that there is a change in management and would like to establish a meeting to discuss these items as well as current *Potentially Significant Impact as reported in the "INITIAL STUDY FOR THE MONTEREY REGIONAL AIRPORT MASTER PLAN"* prepared by Coffman Associates, Inc. 4835 E. Cactus Road, suite 235 Scottsdale, AZ 85254 page 32, Cultural Resources.

OCEN's Tribal leadership desires to be provided with reports, surveys, including subsurface testing, and presence/absence testing. OCEN request to be included in mitigation and recovery programs, reburial of any of our ancestral remains, placement of all cultural items, and that a Native American Monitor of Ohlone/Costanoan-Esselen Nation, approved by the OCEN Tribal Council be used within our aboriginal territory.

We request consultation on projects affecting our aboriginal homelands. We look forward to hearing more information about this project; please feel free to contact me at (408) 629-5189. Nimasianexelpasaleki. Thank you for your attention to this matter.

Sincerely and Respectfully Yours,

Louise J. Miranda Ramirez, Chairperson
Ohlone/Costanoan-Esselen Nation

Issues	*Potentially Significant Impact*	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
V. CULTURAL RESOURCES Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in State CEQA Guidelines, Section 15064.5?	X	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to State CEQA Guidelines, Section 15064.5?	X	☐	☐	☐
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	X	☐	☐	☐
d) Disturb any human remains, including those interred outside of formal cemeteries?	X	☐	☐	☐
e) Would the project cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code, Section 21074?	X	☐	☐	☐

Impact Analysis

V a-e) Potentially Significant Impact. Cultural resources have been identified in the past on the airport property; and, additional historic, archaeological, or paleontological resources could be located on the property. In addition, there is the potential for human remains. Therefore, implementation of the proposed AMP could result in potential impacts to cultural resources that will need to be further evaluated in an EIR.

Tribal cultural resources include sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are listed on State or local historic registers or are otherwise significant per Public Resources Code, Section 21074. The potential for the proposed AMP to cause a substantial adverse change in the significance of tribal cultural resources will need to be further evaluated in an EIR.

NOTICE OF PREPARATION AND NOTICE OF SCOPING MEETING

DATE: December 28, 2015
SUBJECT: Notice of Preparation of an Environmental Impact Report and Notice of Scoping Meeting
PROJECT TITLE: Monterey Regional Airport – Airport Master Plan
APPLICANT: Monterey Peninsula Airport District
200 Fred Kane Drive
Monterey, California 93940

Notice is hereby given pursuant to Section 15082 of the State California Environmental Quality Act ("CEQA") Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq.), that the Monterey Peninsula Airport District ("District"), acting in its capacity as the owner and operator of Monterey Regional Airport, has determined that an Environmental Impact Report ("EIR") is the appropriate environmental document for the Monterey Regional Airport Master Plan Project ("Project"). The District will be the Lead Agency for the Project and will be responsible for the EIR preparation pursuant to CEQA and the State CEQA Guidelines. The Project description, location, and an analysis of the probable environmental effects of the proposed project are contained in the attached materials.

As required by Section 15082 of the CEQA Guidelines, this Notice of Preparation ("NOP") has been prepared and distributed to solicit comments from potential Responsible and Trustee Agencies on Project-related concerns relevant to each agency's statutory responsibilities. Comments on the content and scope of the EIR also are solicited from any other interested parties (including other agencies and affected members of the public). The EIR will be the environmental document of reference for Responsible and Trustee Agencies when considering subsequent discretionary approvals.

The District requests that any potential Responsible or Trustee Agencies responding to this NOP reply in a manner consistent with Section 15082(b) of the State CEQA Guidelines, which allows for the submittal of any comments in response to this notice no later than 45 days after receipt of the NOP. The District will accept comments from these Agencies and others regarding this NOP through the close of business, February 16, 2016.

This NOP is available for viewing at www.montereyairport.com. In addition, a Scoping Meeting will be held from 2:00PM-4:00PM at the following location: 2nd Floor of the Airport Terminal Building 200 Fred Kane Drive, Suite 200, Monterey, CA 93940 on Wednesday, February 3, 2016.

Your agency and other interested parties are invited to attend and submit comments for consideration during preparation of the EIR. All comments and responses to this NOP must be submitted in writing to:

Type of Services	**Preliminary Geotechnical Investigation**
Project Name	**Monterey Peninsula Airport Terminal Building, Parking Structure, Apron Area, and North Side Improvement Areas**
Location	**Salinas Highway (Highway 68) and Olmstead Road** **Monterey, California**

SECTION 1: INTRODUCTION

This preliminary geotechnical report was prepared for the sole use of Kimley-Horn and Associates, Inc. for the Monterey Peninsula Airport Terminal Building, Parking Structure, Apron Area, and North Side Improvements Areas project in Monterey, California. The location of the site is shown on the Vicinity Map, Figure 1. For our use we were provided the following documents:

- An autocad file showing existing elevations (datum unknown) for the airport,
- A google earth image and a topo map both showing preliminary fill placement and grading limits on the north side of airport and a cross section of the preliminary fill placement and grading.

1.1 PROJECT DESCRIPTION AND REQUIREMENTS

The project site is located north of Salinas Highway (Highway 68) at the Monterey Peninsula Airport in Monterey, California. The project is to include relocating the Monterey Peninsula Airport terminal building and apron area southeast of their present location and reconfiguring Taxiway A as part of the relocation project. The new terminal apron and terminal building will overlay the existing parking, hanger, and ramp areas on the south side of the airport. Due to the existing elevation differences between the parking, hanger, and ramp areas and the existing elevation of the taxiway and runways, we understand 10- to 12-foot cuts with retaining walls will be required to retain existing soils and transition the existing grade down to the existing taxiway and runway levels. The new terminal building will most likely be two levels to accommodate the elevation difference. To the west of the proposed apron area, ancillary 3-level at-grade parking structure and likely smaller structures are planned. Additionally, an access road will be constructed around the perimeter of the apron.

On the north side of the airport, a general aviation apron will be constructed adjacent to the existing apron and Navy Flying Club facilities. Hangers will also be relocated to this new apron area. Construction in this area will include placing 5 to 10 feet of fill to raise the site grades. Additionally, approximately 100,000 cubic yards of excess material generated from the planned cuts from the south side terminal and apron relocation will be placed on the north side of the airport.

Structural loads for the proposed terminal building are not know at this time, however are expected to be typical of this type of building.

1.2 SCOPE OF SERVICES

Our scope of services was presented in our proposal dated November 25, 2016 and consisted of field and laboratory programs to evaluate physical and engineering properties of the subsurface soils, engineering analysis to prepare preliminary recommendations for earthwork, pavements, building foundations, retaining walls, temporary cut slopes and shoring, and fill placement and slope configurations for fill placement on the north side of airport, and preparation of this report. Brief descriptions of our exploration and laboratory programs are presented below.

1.3 EXPLORATION PROGRAM

Field exploration consisted of 19 borings drilled on December 11 to 14, 2016, with truck-mounted, hollow-stem auger drilling equipment. The borings were drilled to depths ranging from 10½ to 40 feet. The borings were backfilled with cement grout in accordance with local requirements; exploration permits were obtained as required by local jurisdictions.

The approximate locations of our exploratory borings are shown on the Site Plan, Figure 2. Details regarding our field program are included in Appendix A.

1.4 LABORATORY TESTING PROGRAM

In addition to visual classification of samples, the laboratory program focused on obtaining data for preliminary pavement design, retaining wall design, foundation design, and seismic ground deformation estimates. Testing included moisture contents (ASTM D2216), dry densities (ASTM D2937), grain size analyses (sieve and hydrometer – ASTM D422), washed sieve analyses (ASTM D1140), Plasticity Index (ASTM D4318), Compaction Tests (ASTM D1557), and California Bearing Ratios (ASTM D1883). Details regarding our laboratory program are included in Appendix B.

1.5 PRELIMINARY CORROSION EVALUATION

Two samples from our borings were tested for saturated resistivity, pH, soluble sulfates, and chlorides. The laboratory data is presented in Appendix C of this report. The development of corrosion protection recommendations and/or designs should be performed by a corrosion engineer.

1.6 ENVIRONMENTAL SERVICES

Environmental services were not requested for this project. If environmental concerns are determined to be present during future evaluations, the project environmental consultant should review our geotechnical recommendations for compatibility with the environmental concerns.

SECTION 2: REGIONAL SETTING

2.1 GEOLOGICAL SETTING

The site is located within the coast range geomorphic province of central California. Throughout the Cenozoic Era, central California has been affected by tectonic forces associated with lateral or transform plate motion between the North American and Pacific crustal plates, producing a complex system of northwest-trending faults - the San Andreas Fault system (Page, 1998). Uplift, erosion and subsequent re-deposition of sedimentary rocks within this province have been driven primarily by the northwest directed, strike-slip movement of the tectonic plates and the associated northeast oriented compressional stress. The northwest-trending coastal mountain ranges are the result of an orogeny (formation of mountains by the process of tectonic uplift) believed to have been occurring since the Pleistocene epoch (approximately 2-3 million years before present).

The portion of the Santa Lucia Mountains where the site exists is within the Salina Block, which is bound by the San Andreas fault on the east, and by the San Gregorio - Palo Colorado fault to the west. The Salina block is composed of an elongate prism of granites and metamorphic rock types. The Salina basement complex is overlain primarily by marine sedimentary rocks of tertiary age and terrestrial rocks of Pliocene to Pleistocene age. The geologic formations in the vicinity of the site consist of granitic basement rocks overlain by a sequence of marine and terrestrial sedimentary rocks that have been deformed into a series of northwest trending folds by regional tectonic forces. A Regional Geologic Map based on Dibblee (2007) is presented as Figure 3.

2.2 REGIONAL SEISMICITY

The San Francisco Bay area region is one of the most seismically active areas in the Country. While seismologists cannot predict earthquake events, geologists from the U.S. Geological Survey have recently updated earlier estimates from their 2014 Uniform California Earthquake Rupture Forecast (Version 3) publication. The estimated probability of one or more magnitude 6.7 earthquakes (the size of the destructive 1994 Northridge earthquake) expected to occur somewhere in the San Francisco Bay Area has been revised (increased) to 72 percent for the period 2014 to 2043 (Aagaard et al., 2016). The faults in the region with the highest estimated probability of generating damaging earthquakes between 2014 and 2043 are the Hayward (33%), Rodgers Creek (33%), Calaveras (26%), and San Andreas Faults (22%). In this 30-year period, the probability of an earthquake of magnitude 6.7 or larger occurring is 22 percent along the San Andreas Fault and 33 percent for the Hayward or Rodgers Creek Faults. As seen with damage in San Francisco and Oakland due to the 1989 Loma Prieta earthquake that was centered about 50 miles south, significant damage can occur at considerable distances. Higher

levels of shaking and damage would be expected for earthquakes occurring at closer distances.

The faults considered capable of generating significant earthquakes are generally associated with the well-defined areas of crustal movement, which trend northwesterly. The table below presents the State-considered active faults within 25 kilometers of the site.

Table 1: Approximate Fault Distances

Fault Name	Distance	
	(miles)	(kilometers)
Monterey Bay-Tularcitos (Navy)	1.1	1.8
Rinconada	7.7	12.4
San Gregorio	9.3	15.0

The San Andreas fault is located approximately 40 kilometers to the northeast. The Chupines fault, which is not a State-considered fault, is located about 2.1 miles to the southeast. Fault distances for the Navy and Chupines faults were taken from Dibblee (2007). A regional fault map is presented as Figure 4, illustrating the relative distances of the site to significant fault zones.

SECTION 3: SITE CONDITIONS

3.1 SITE GEOLOGY

Published maps covering the regional geology in the general vicinity of the site include those by Clark et al. (1974, 1997), Greene (1977), and Dibblee (2007). These regional maps are based upon aerial photo interpretation, reconnaissance style mapping and field checking at sparsely distributed locations in the area and do not include site-specific data. Figure 3, Regional Geologic Map is a partial reproduction of the geologic map of Dibblee (2007), the most detailed mapping that has been done in the vicinity.

All the maps reviewed indicate that the site is underlain by Quaternary deposits which in turn overlie bedrock of the Miocene Monterey Formation, which is folded into a series of northwest trending anticinal and synclinal structures. Dibblee (2007) indicates the Airport property is underlain by three Quaternary age formations; “Dissected older alluvium” (“Qoa”) across much of the Airport property, Aromas sand (“Qar”) at the south property line, and “Older stabilized dune and drift sand” (“Qos”) capping the very top of the terrace in the eastern portion of the property.

3.2 SURFACE DESCRIPTION

3.2.1 North Side Improvements

This area of the project is located on the north side of the airport runway and taxiways. The proposed location of the general aviation apron and relocated hangers is adjacent to the Navy Flying Club facilities to the east, a taxiway to the south, and Airport Road beyond to the north. This area is a generally flat graded area sloping down to the west with approximately Elevation 216 feet at the east end and approximately Elevation 202 feet at the west end. Beyond the north side of the generally flat graded area, grades slope gradually down to Airport Road with a steeper approximately 3:1 (H:V) 6-foot drop down to Airport Road at the northwest corner of the graded area. This flat graded area proposed for the general aviation apron is generally covered in weeds and small shrub like plants. Borings EB-4 and EB-5 were performed in this area.

The proposed location for the approximately 100,000 cubic yards of material generated from the planned cuts on the south side of the airport is located to the south of Airport Circle and the residential buildings beyond, to the east of Airport Circle, and to the north and east of N Road and Airport Road beyond to the south. This area slopes up from the residential buildings and Airport Circle to the top of a previously placed berm that generally parallels Airport Circle. The top of berm is approximately 10 to 15 feet higher than Airport Circle and the residential buildings beyond and has gradients up to about 3½:1 to 4:1 (H:V). Grades slope down to the south approximately 7 to 10 feet from the top of berm in most locations with a similar gradient as the north side before sloping downward more gradually to the south and southwest to a flatter graded area that appears to be used as a staging area to the north of N Road. To the south of N Road grades slope up about 20 to 25 feet to Airport Road with gradients up to about 3.5:1 to 3:1 (H:V). Areas other than the staging area and roadways are generally covered with mature trees and shrubs. The top of berm is generally an unimproved pathway with evidence vehicular travel. Borings EB-1 and EB-2 were performed on the unimproved pathway along the berm and Boring EB-3 was performed within the staging area.

3.2.2 New Terminal Building, Parking Structure, and Apron Area

This area of the project is located on the south side of the main airport runway and is bounded by Olmsted Road, Salinas Highway (68), and other office/commercial buildings to the south and southeast. The existing Taxiway A and existing terminal apron are located along the northern extent of this project area running generally west to east. The taxiway and apron slope gradually up to the east with approximate Elevation 178 feet at our most westerly Boring EB-6 and approximate Elevation 213 feet at our most easterly Boring EB-9. Borings EB-6, EB-8, and EB-9 were performed on the existing Taxiway A and Boring EB-7 was performed on the existing terminal apron. The taxiway consisted of asphalt concrete and the apron consisted of Portland cement concrete.

To the south of the existing Taxiway A and terminal apron, the existing terminal building, long term parking lot, and an airport hanger area are located west to east, respectively. The existing terminal building is generally at the elevation of the terminal apron while the long term parking lot and airport hanger area have elevations range up to about 10 feet above the taxiway and

apron level along the northern extent of parking lot and hanger area. The parking lot and hanger area gradually slope up to the east and southeast, however grades are more gradual than Taxiway A to the north resulting in the most easterly portion of the hanger area only roughly about 2 feet above Taxiway A grades at the adjacent location. Between the long term parking area and hanger area a pavement ramp inclines up about 8 to 10 feet connecting Taxiway A below with the hanger area and associated areas above. Another ramp is located at the eastern extend of the hanger area, but as mentioned above, only ramps up about 2 feet as Taxiway A is close to the elevation of the hanger area at this extent. Borings EB-12, EB-14, and EB-15 were performed within the long term parking lot and Borings EB-10, EB-11, EB-13, EB-16, EB-17, and EB-19 were performed within the hanger area. The parking lot and hanger area consist of asphalt concrete. An airport fire station is located between the long term parking lot and terminal apron area with the upper level connecting to the parking lot and the lower level at the apron elevation. Landscaping consisting of grass and small shrubs is located in the sloped area between the parking lot and hanger area and the taxiway and apron below. Beyond the anticipated project boundary along the eastern and southeast border of the hanger area, grades slope up to the south and east to office/commercial building developments beyond.

Olmsted Way runs along the south end of the long term parking lot and connects Olmsted Road with the hanger area. An employee parking lot and staging area is located to the south of Olmsted Way and to the west of the southern portion of the hanger area. Grades in this area are generally level. Boring EB-18 was performed within the staging area, which may be the site for a new at-grade parking structure in the future. The parking lot consists of asphalt concrete and the staging area is covered in gravel/aggregate base material.

3.3 SUBSURFACE CONDITIONS

Nineteen borings were drilled as part of our geotechnical investigation for the new terminal building, apron area improvements, and improvements on the north side of the airport. Borings EB-1 to EB-5 were performed on the north side of the airport, Borings EB-6, EB-8, and EB-9 were performed on the existing taxiway, Boring EB-7 was performed on the existing terminal apron, and Borings EB-10 to EB-19 were performed in the existing long-term parking, employee parking, and hanger areas at the south side of airport. Borings EB-6 to EB-17 were located within areas of existing pavements and were cored prior to the borings being performed. A summary of the pavement core thicknesses and underlying aggregate base (AB) thicknesses at these boring locations are shown in Table 2.

Table 2: Summary of Pavement Core Thicknesses

Boring Number	Total Pavement Thickness[(1)]	AB Thickness[(1)]
EB-6	9¾" AC[(2)]	5" AB
EB-7	14½" PCC	4" AB
EB-8	12⅛" AC[(2)]	5" AB
EB-9	11¼" AC[(2)]	8" AB
EB-10	1½" AC	5" AB
EB-11	1½" AC	4" AB
EB-12	4¾" AC[(2)]	3½" AB
EB-13	2¾" AC	4" AB
EB-14	4½" AC[(2)]	No AB
EB-15	2½" AC	No AB
EB-16	2" AC	4" AB
EB-17	2¾" AC	5" AB

Note: [1] AC = Asphalt Concrete or Hot Mixed Asphalt (HMA), [1]AB = Aggregate Base, [1] (All pavement section thicknesses were measured by hand in the field and may vary).
[2] Pavement thickness included an overlay separated by pavement fabric. Overlay thickness was approximately 2 inches for EB-6, EB-8, and EB-12. Overlay thickness was about 2⅜ inches for EB-9 and 2¼ inches for EB-14.

3.3.1 Proposed Stockpile Soil Area – North Side of Airport

Borings EB-1 to EB-3 were performed in the area proposed for the approximately 100,000 cubic yards of cut material from the south side improvements. Borings EB-1 and EB-2 were performed along the top of the existing berm in the area. Below the ground surface, these borings encountered 11 to 12 feet of undocumented fill consisting of medium dense to very dense silty, clayey, and poorly graded sand with silt. Beneath the fill, native loose to dense silty, clayey, and poorly graded sands with variable amounts of silt were encountered to the maximum depths explored of 35 feet. The upper portion of these native soils was generally found to be loose to medium dense. Boring EB-3 was performed within the graded staging area. Beneath the ground surface, native loose poorly graded sand with silt was encountered to a depth of about 5 feet followed by medium dense poorly graded sand with silt and very dense silty sand to the maximum depth explored of about 14 feet.

3.3.2 General Aviation Apron Relocated Hangers Area – North Side of Airport

Boring EB-4 and EB-5 were performed in the area proposed for the general aviation apron and relocated hangers adjacent to the Navy Flying Club facilities. Beneath the ground surface, these borings encountered native medium dense to dense poorly graded sand with variable amounts of silt to the maximum depth explored of 15 feet.

3.3.3 Existing Taxiway A and Terminal Apron Area

Borings EB-6 to EB-9 were performed in the existing Taxiway A and terminal apron area. Beneath the pavement section (AC and AB) for Boring EB-6, undocumented fill consisting of dense silty, clayey sand and medium dense poorly graded sand with silt and gravel were encountered to a depth of about 5 feet below the surface. Beneath the fill in Boring EB-6 and the pavement section (AC or PCC and AB) in Borings EB-7 to EB-9, medium dense to very dense silty sand and poorly graded sand was generally encountered to a depth of 8 to 11½ feet. Medium dense to dense clayey sand was encountered in Boring EB-7 and EB-9 starting at a depth of 8 and 9 feet, respectively. The terminal depth of these boring was 10½ to 11½ feet.

3.3.4 New Terminal Building and Terminal Apron Area

Borings EB-10 to EB-18 were performed in areas anticipated to be cut up to about 10 to 12 feet to bring grades down to the new terminal building lower level and terminal apron levels, corresponding to the level of the existing Taxiway A and terminal apron. Beneath the pavement sections (AC and AB), undocumented fill consisting of very dense clayey sand with gravel and loose to very dense poorly graded sand with silt was encountered in Borings EB-10 to EB-12 to depths of about 2½ to 3¼ feet beneath the surface. Beneath the undocumented fill in Borings EB-10 to EB-12, pavement sections in Borings EB-13 to EB-17, and a surficial aggregate base section in EB-18, generally sands with variable amounts of silt and clay were encountered to the maximum depths explored of 40 feet below the surface. These sands were generally loose to medium dense to a depth of about 7½ to 12 feet in Borings EB-10, EB-12 to EB-15, and EB-18. The sands were generally dense to very dense in the other borings and beneath the loose to medium dense sands in Borings EB-10, EB-12 to EB-15, and EB-18. A minor layer of very stiff sandy silty clay about 1 to 2½ feet thick was encountered at a depth of about 15 and 17½ feet in Boring EB-10 and EB-12, respectively. A layer of very dense to hard lean clay and sandy lean clay about 3 to 6 feet thick was encountered at a depth of about 17½ feet in Boring EB-14 and EB-15. A very stiff fat clay layer was encountered at a depth of 37 feet down to the terminal depth of 40 feet in Boring EB-18.

Boring EB-19 was performed in the location of an anticipated ramp down to the new terminal building lower level and apron level. Beneath the ground surface medium dense poorly graded sand with silt was encountered to about 2½ feet followed by generally dense to very dense sands with variable amounts of silt and clay to the terminal depth of 20 feet. A thin ½-foot thick layer of very stiff lean clay was encountered at 5½ feet beneath the surface.

Detailed boring logs, as well as a key to the classification of the soil encountered in our investigation can be found in Appendix A of this report.

3.3.5 Plasticity/Expansion Potential

We performed seven Plasticity Index (PI) determination tests on representative subsurface samples at depths ranging from 1½ to 19½ feet below grade. The test results were used to evaluate plasticity and expansion potential of the proposed new terminal apron and taxiway bearing soils and to evaluate the plasticity and expansion potential of soils beneath the

proposed terminal building. The PI test results ranged from non-plastic to 21, indicating none to moderate expansion potential. Tests from the soils beneath the new terminal apron and taxiway ranged from non-plastic to 14, indicating none to low expansion potential. A Plasticity Index Testing Summary is presented as Figure B1 in Appendix B.

3.4 GROUND WATER

Ground water was encountered in Borings EB-14, EB-17, and EB-18, at depths of 32, 13, and 26½ feet, respectively, below current site grades. Ground water was not encountered in our other borings. All measurements were taken at the time of drilling and may not represent the stabilized levels that can be higher than the initial levels encountered.

Ground water levels are not currently mapped at the site by the State of California. We reviewed the GeoTracker website regarding ground water depths in the site area. Based on our GeoTracker website search, there is no available data within the site area.

Fluctuations in ground water levels occur due to many factors including the following: seasonal water fluctuations, underground drainage patterns causing perched water conditions above steady ground water levels, regionally the average ground water level can fluctuate over long time periods, and other factors.

On a preliminary basis, ground water appears to be below the depth of the new terminal building and apron area (on the order of 3 feet or greater). Depth to ground water should be further evaluated during a design-level investigation to establish a design ground water depth and evaluate any effects, if any, ground water may have on pavements and the terminal building.

3.5 CORROSION SCREENING

We tested two samples for resistivity, pH, soluble sulfates, and chlorides collected from Borings EB-13 and EB-14 at depths of approximately 11½ and 10 feet, respectively. These depths are anticipated to be at the approximate depth of the future terminal apron and lower level of the terminal building. The laboratory test results are summarized in Table 3A and provided in Appendix C. The development of corrosion protection recommendations and/or designs should be performed by a corrosion engineer.

Table 3A: Summary of Corrosion Test Results

Boring/Sample	Depth (feet)	Soil pH[1]	Resistivity[2] (ohm-cm)	Chloride[3,5] (mg/kg)	Sulfate[4,5] (mg/kg)
EB-13/6	11½	6.5	26,138	<2	2
EB-14/5	10	7.0	21,525	<2	25

Notes: [1]ASTM G51
[2]ASTM G57 - 100% saturation
[3]ASTM D4327/Cal 422 Modified
[4]ASTM D4327/Cal 417 Modified
[5]1 mg/kg = 0.0001 % by dry weight

Many factors can affect the corrosion potential of soil including moisture content, resistivity, permeability, and pH, as well as chloride and sulfate concentration. Typically, soil resistivity, which is a measurement of how easily electrical current flows through a medium (soil and/or water), is the most influential factor. In addition to soil resistivity, chloride and sulfate ion concentrations, and pH also contribute in affecting corrosion potential.

Based on the laboratory test results summarized in Table 2A and published correlations between resistivity and corrosion potential, the soils may be considered very mildly corrosive to buried metallic improvements (Chaker and Palmer, 1989).

In accordance with the 2016 CBC Section 1904.1, alternative cementitious materials shall be determined in accordance with ACI 318-14 Table 19.3.1.1, Table R19.3.1, and Table 19.3.2.1. Based on the laboratory sulfate test results, no cement type restriction is required, although, in our opinion, it is generally a good idea to include some sulfate resistance and to maintain a relatively low water-cement ratio. We have summarized applicable sulfate design values and parameters from ACI 318-14, Chapter 19 below in Table 3B.

We recommend the structural engineer and a corrosion engineer be retained to confirm the information provided and for additional recommendations, as required.

Table 3B: ACI Sulfate Soil Corrosion Design Values and Parameters

Category	Water-Soluble Sulfate (SO4) in Soil (% by weight)	Sulfate (S) Class	Cementitious Materials (2)
S, Sulfate	< 0.10	S0	no type restriction

Notes: (1) above values and parameters are from on ACI 318-14, Table 19.3.1.1, Table R19.3.1, and Table 19.3.2.1
(2) cementitious materials are in accordance with ASTM C150, ASTM C595, and ASTM C1157

SECTION 4: GEOLOGIC HAZARDS

4.1 FAULT RUPTURE

As discussed above several significant faults are located within 25 kilometers of the site. The site is not located within a State-designated Alquist Priolo Earthquake Fault Zone. As shown in Figure 4, no known surface expression of fault traces is thought to cross the site; therefore, fault rupture hazard is not a significant geologic hazard at the site.

4.2 ESTIMATED GROUND SHAKING

Moderate to severe (design-level) earthquakes can cause strong ground shaking, which is the case for most sites within the Bay Area. A peak ground acceleration (PGA) was estimated for analysis using a value equal to F_{PGA} x PGA, as allowed in the 2016 edition of the California Building Code. For our analysis we used a PGA of 0.576g.

4.3 LIQUEFACTION POTENTIAL

The site is not located within an area covered by the current State mapping for Liquefaction Hazard Zones. However, the airport is map as being in areas of low susceptibility and variable (may range from high to low) susceptibility (Rosenberg, L.I.; 2001). We screened the site for liquefaction during our site exploration by retrieving samples from the site, performing visual classification on sampled materials, and performing various tests to further classify the soil properties.

During strong seismic shaking, cyclically induced stresses can cause increased pore pressures within the soil matrix that can result in liquefaction triggering, soil softening due to shear stress loss, potentially significant ground deformation due to settlement within sandy liquefiable layers as pore pressures dissipate, and/or flow failures in sloping ground or where open faces are present (lateral spreading) (NCEER 1998). Limited field and laboratory data is available regarding ground deformation due to settlement; however, in clean sand layers settlement on the order of 2 to 4 percent of the liquefied layer thickness can occur. Soils most susceptible to liquefaction are loose, non-cohesive soils that are saturated and are bedded with poor drainage, such as sand and silt layers bedded with a cohesive cap.

Borings EB-12, EB-14, EB-15, and EB-18 extended to a maximum depth of 40 feet below existing site grades and were performed in the anticipated location of the future terminal and parking structure buildings. As previously mentioned, we understand the parking structure will be at-grade while site grades will be lowered about 10 to 12 feet within the terminal building area. Additionally, as discussed, ground water appears to be below the depth of the new terminal building. Below a depth of about 10 feet, the above mentioned borings generally encountered very stiff to hard cohesive clays and medium dense to very dense granular soils. In our opinion, granular soils with SPT “N” values of 30 or greater are too dense to liquefy and have been screened out of our analysis. Based on the above, our preliminary analysis and screening within the anticipated terminal building location indicates the soils could theoretically experience liquefaction triggering that could result in soil softening and post-liquefaction total settlement of up to about ¼ inch based on the Yoshimine et.al (2006) method. The potential for liquefaction settlement in the location of the terminal building should be further evaluated during a design-level geotechnical investigation once the building footprint has been established.

Borings EB-4 and EB-5 were performed in the location of the proposed general aviation apron and relocated hangers and extended to a maximum depth of 15 feet below existing site grades. Ground water was not encountered in these borings. Boring EB-3 was performed to the north of this area and positioned at a ground surface elevation about 23 and 36 feet below Boring EB-5 and EB-4, respectively. Ground water was not encountered to the maximum depth explored in Boring EB-3 of about 14 feet which corresponds to a depth of about 50 feet below Boring EB-4 and 37 feet below Boring EB-5. Therefore, since ground water is anticipated to be at greater depths, in our opinion, the potential for liquefaction settlement in the location of the relocated hangers is low.

4.4 LATERAL SPREADING

Lateral spreading is horizontal/lateral ground movement of relatively flat-lying soil deposits towards a free face such as an excavation, channel, or open body of water; typically lateral spreading is associated with liquefaction of one or more subsurface layers near the bottom of the exposed slope. As failure tends to propagate as block failures, it is difficult to analyze and estimate where the first tension crack will form.

There are no open faces within a distance considered susceptible to lateral spreading; therefore, in our opinion, the potential for lateral spreading to affect the site is low.

4.5 SEISMIC SETTLEMENT/UNSATURATED SAND SHAKING

Loose to medium dense unsaturated sandy soils can settle during strong seismic shaking. We evaluated the potential for seismic compaction of the unsaturated sandy soils in the anticipated location of the terminal building, relocated hangers, and proposed engineered fill slope for the placement of the approximately 100,000 cubic yards of material generated from the planned cuts for the terminal building and apron relocation based on the work by Pradell (1998).

As mentioned, we understand site grades will be lowered about 10 to 12 feet within the terminal building area. Our analyses indicate that the unsaturated sandy soils beneath a depth of about 10 feet could experience up to about ¼ inch of movement after strong seismic shaking. However, if the bottom level of the terminal building is not lowered about 10 to 12 feet as currently anticipated and is constructed near existing grades, our analyses indicate an additional ¼ inch of movement could occur. In the area of the relocated hangers, our analyses indicate that the unsaturated sandy soils could experience up to about ¼ inch of movement after strong seismic shaking. In the location of the proposed engineered fill slope for placement of the cut materials, our analyses indicated that the existing soils could experience 1 to 1½ inches of movement after strong seismic shaking. Once the footprint locations of the terminal building and relocated hangers has been established, the potential for unsaturated sand shaking should be further evaluated during a design-level geotechnical investigation.

SECTION 5: SLOPE STABILITY

5.1 PRELIMINARY SLOPE STABILITY EVALUATION

As discussed, the approximately 100,000 cubic yards of material anticipated to be generated from the planned cuts for the terminal building and apron relocation are to be placed along the north side of the airport. Based on the preliminary grading and fill placement maps provided and our discussions with you, we prepared Geologic Cross Section A-A', Figure 5. Cross Section A-A' depicts the existing topography and the proposed 3:1 (horizontal:vertical) engineered fill slope within the area of proposed fill placement. This cross section was evaluated for static and seismic stability.

Existing grades beneath the proposed engineered fill slope range up to about 3.5:1 (horizontal:vertical). Additionally, as mentioned in the subsurface section, the upper portion of

the native soils beneath the existing berm fills were found to be generally loose to medium dense. As such, we recommend a keyway be cut below the loose native soils at the toe of proposed engineered fill slope and the existing berm be benched into as engineered fill is placed up to final proposed grades. A keyway and benching has been modeled in Cross Section A-A'. Detailed discussions of our evaluation are presented in the following paragraphs.

The analyses presented in this report should be considered preliminary because the project grading plans are conceptual at this stage. The purpose of the analysis is to demonstrate that the overall grading concept is feasible. Additional slope stability analyses should be performed as part of the design-level geologic and geotechnical investigation for the project.

5.1.1 Method of Analysis

The stability of a slope is influenced by many factors including but not limited to the geologic structure and composition, inclination, and height of a slope, ground water, climatic factors such as rainfall, and irrigation. In geotechnical engineering, "stability" is expressed as a ratio of resisting moments and forces divided by driving moments and forces termed the factor of safety (FS). Factors of safety can be calculated for static and seismic conditions. In performing the slope stability analysis, we followed the guidelines set forth by California Geologic Survey (CGS) in Special Publication 117A (2008).

The stability of the geologic cross section was evaluated using the computer program GSTABL7, and circular modes of failure. Input parameters for the analyses include slope geometry, soil layers or zones, total and saturated unit weights and strength parameters, ground water conditions, and assumed areal surface loading.

In evaluating the stability of slopes under seismic conditions, GSTABL7 uses a "pseudo-static" method of analysis. The pseudo-static method models the effects of transient or pulsating earthquake loading on a potential slide mass by using an "equivalent" static horizontal acceleration acting on the mass of the potential landslide in a limit-equilibrium analysis.

The ground motion parameter used in a pseudo-static analysis is referred to as the seismic coefficient "k". CGS (2008) has published recommendations for the selection of the "k" value in a publication titled, "Guidelines for Evaluation and Mitigation of Seismic Hazards in California, SP 117A." The site is located near the active Monterey Bay-Tularcitos, Rinconada and San Gregorio Faults and moderately high ground shaking can be expected during a seismic event near the site. In accordance with the CGS Guidelines, we have performed our pseudo-static analysis using a "k" value of 0.28, which considered an earthquake magnitude of 7.4 for the Monterey Bay-Tularcitos fault. This "k" value also considered a threshold of displacement on the order of 6 inches (15 cm) or less.

Based on our understanding of current standards of practice, the minimum allowable factor of safety with respect to slope stability generally ranges from 1.5 to 2 for static conditions and 1 to 1.2 for seismic conditions. A pseudo-static factor of safety of 1.0 typically implies "movement" of the slope mass and does not necessarily result in complete slope failure. In our opinion, acceptable factors of safety for static and seismic (pseudo-static) conditions may be considered

to be 1.5 and 1.0, respectively. For our analyses, we judged that if seismic stability factors of safety met or exceeded 1.0, that yielding or movement will likely be limited to less than a few to several inches. This is consistent with the guidelines set forth in SP 117A (CGS, 2008) and appears reasonable for the intended use and importance of the proposed improvements.

5.1.2 Selection of Preliminary Soil Properties

The engineered fill will be soil generated from keyway and benching excavation and the planned cuts for the terminal building and apron relocation. The strength parameters for the engineered fill was based on laboratory testing of similar materials from our previous "Monterey Peninsula Airport Runway Safety Area Study" performed in 2011 and our engineering judgement.

The strength parameters for the in-place undocumented fills and native sand deposits were determined based on our boring data including "N" values, densities, and moistures, and our engineering judgement. We estimate the in-place sand deposits to have an internal angle of friction (ϕ) of 30 to 36 degrees, and cohesion (c) generally ranging from 0 to 50 pounds per square foot. A summary of the soil parameters used in our analyses are presented in the table below.

Table 4: Summary of Preliminary Soil Strength Properties

Material Description	Total Unit Weight (pcf)	Saturated Unit Weight (pcf)	Cohesion (psf)	Friction Angle (degrees)
Engineered Fill	110	115	0	36
Sand (SM) – loose	81	86	0	30
Sand (SP) – m. dense	100	105	0	33
Undocumented Fill Sand (SC) – m. dense	110	115	50	33
Sand (SP) - dense	100	105	0	36
Undocumented Fill Sand (SM) – v. dense	124	130	0	36

As the slopes are unsaturated, with the ground water table anticipated to be at greater depths not influencing the stability of the proposed fill slope, the effective strength parameters used for the static analyses were also used for the seismic analyses, following discussions in SP 117A (CGS, 2008).

5.1.3 Anticipated Surficial Loads

At this time, we are not aware of any proposed surficial loads on the slope and fill placement area. As such, no surficial loading have been included in our analyses.

5.1.4 Results of Analysis

The output (calculations) from our stability analyses for both static and seismic (pseudo-static) conditions are presented in Appendix D. Our preliminary analyses for the cross section indicate acceptable factors of safety with respect to slope movement under static and seismic loading conditions with a static factor of safety of 3.3 and a seismic factor of safety of 1.4. The final slope fill slope geometry should be evaluated during a design-level geotechnical investigation.

SECTION 6: CONCLUSIONS

6.1 SUMMARY

From a geotechnical viewpoint, the project is feasible provided the concerns listed below are addressed in the project design. The preliminary recommendations that follow are intended for conceptual planning and preliminary design. A design-level geotechnical investigation should be performed once site development plans are prepared indicating where the proposed terminal building, terminal apron, and other proposed improvements are planned. The design-level investigation findings will be used to confirm the preliminary recommendations and develop detailed recommendations for design and construction. Descriptions of each geotechnical concern with brief outlines of our preliminary recommendations follow the listed concerns.

- Fill slope stability
- Potential for static and seismic settlements
- Cohesionless soils
- Ground water
- Differential movement at on-grade to on-structure transitions
- Highly erodible soils
- Terminal apron subgrade soil conditions
- Retaining wall construction difficulties with cohesionless sands

6.1.1 Fill Slope Stability

As discussed, we performed a preliminary slope stability analyses for the proposed placement of fill from the approximately 100,000 cubic yards of material to be cut for the new terminal building and apron. Our analyses indicate acceptable factors of safety with respect to slope movement under static and seismic loading conditions provided the proposed engineered fill slope is maintained at a 3:1 (horizontal:vertical) and that a keyway at the bottom of slope is constructed and the existing berm slope is benched into as discussed in the “Earthwork” section below.

6.1.2 Potential for Static and Seismic Settlements

In addition to static settlement due to building loads, our preliminary analyses indicate areas of the proposed terminal building may experience seismically-induced total and differential

settlements from dry sand settlement and from liquefaction settlement and the relocated hanger buildings may experience seismically-induced total and differential settlements from dry sand settlement. Provided the lower level of the terminal building is about 10 to 12 feet below existing site grades, we anticipate total combined seismic settlements from dry sand shaking and liquefaction up to about ½ inch and total static settlement from building loads of about ⅔ inch. Combined differential static and seismic settlements are anticipated on the order of ½ to ⅔ inch between independent foundation elements. As previously discussed, if the lower level of the terminal building is not 10 to 12 feet below existing grades, we anticipate an additional ¼ inch of settlement from dry sand settlement could occur.

For the relocated hanger buildings, we anticipate total seismic settlement from dry sand shaking of up to ¼ inch and total static settlement from building loads of about ½ inch. Combined differential static and seismic settlements are anticipated on the order of ½ inch between independent foundation elements. Seismic and static settlement estimates should be further evaluated during a design-level investigation once building layouts and configurations have been determined.

6.1.3 Cohesionless Soils

The site is generally underlain by cohesionless, sandy soils. Due to the cohesionless sandy soils, excavation sidewalls for foundations, utility trenches, etc. may cave in or accumulate a significant amount of slough. Contractors should plan on forming footings, preparing slab-on-grade subgrade just prior to concrete placement, and other similar construction issues as relates to utility excavations, etc.

6.1.4 Ground Water

As discussed, ground water was encountered in Borings EB-14, EB-17, and EB-18 at depths of 32, 13, and 26 ½ feet, respectively, below existing site grades. Borings EB-14 and EB-18 were performed in the anticipated location of the proposed terminal building, which has an anticipated lower level about 10 to 12 feet below existing site grades. At these depths, ground water is not anticipated to affect foundations for the terminal building, however the depth to ground water should be further evaluated during a design-level investigation to determine any affects ground water may have on the building.

Boring EB-17 was performed toward the eastern side of the proposed terminal apron. Grades are only anticipated to be lowered about 2 to 5 feet in this area, however if subgrade compaction and grading require grades to be lowered closer to the ground water, grading could be impacted. Impacts typically consist of potentially wet and unstable subgrade and difficulty achieving compaction. As discussed ground water levels can fluctuate due to many factors. Once final grading has been established, depth to ground water should be further evaluated during a design-level investigation to determine the potential for encountering ground water during grading and subgrade preparation.

6.1.5 Differential Movement At On-grade to On-Structure Transitions

Some improvements may transition from on-grade support to overlying the basement (on-structure) for the new terminal building. Where improvements transition from on-grade to the basement, these transition areas typically experience increased differential movement due to a variety of causes, including difficulty in achieving compaction of retaining wall backfill closest to the wall. We recommend consideration be given to including subslabs beneath flatwork or pavers that can cantilever at least 3 feet beyond the wall. If surface improvements are included that are highly sensitive to differential movement, additional measures may be necessary. We also recommend that retaining wall backfill be compacted to 95 percent where surface improvements are planned.

6.1.6 Highly Erodible Soils

The sands encountered in our exploration and generally present at the site consist of fine to medium sands with fine contents generally less than 30 percent. These types of soils are highly subject to erosion from wind and water. We recommend that final slopes in sand be 3:1 (H:V) or flatter to limit erosion. All exposed surfaces should be vegetated or otherwise protected from erosion. Additional recommendations are provided in the "Earthwork" section below.

6.1.7 Terminal Apron Subgrade Soil Conditions

The soils anticipated to be exposed at the terminal apron subgrade level appear to be variable. These soils also have the potential to become unstable during grading and other construction activities. If the upper soils of the terminal apron subgrade are cement treated, a more consistent subgrade surface would be created and the potential for instability will be greatly reduced. Additionally, cement treatment would increase the design CBR for the subgrade. Additional recommendations are provided in the "Earthwork" section below.

6.1.8 Retaining Wall Construction Difficulties with Cohesionless Sands

The sands generally consist of fine to medium sands with silty and clayey fines generally less than 30 percent. These sands will likely not stand vertical when excavated. The contractor who will construct the retaining walls to transitions grades down to the terminal apron and lower level of the terminal building will need to address this issue. Temporary vertical elements for face stability will likely be required. Recommendations addressing this concern are presented in the "Earthwork" and "Retaining Walls" section of this report.

6.2 DESIGN-LEVEL GEOTECHNICAL INVESTIGATION

The preliminary recommendations contained in this preliminary study were based on limited site development information, limited exploration, and our experience in the area with similar projects. As site conditions may vary significantly between the small-diameter borings performed during this investigation, we also recommend that we be retained to 1) perform a design-level geotechnical investigation, once detailed site development plans are available; 2) to review the geotechnical aspects of the project structural, civil, and landscape plans and

specifications, allowing sufficient time to provide the design team with any comments prior to issuing the plans for construction; and 3) be present to provide geotechnical observation and testing during earthwork and foundation construction.

SECTION 7: PRELIMINARY EARTHWORK RECOMMENDATIONS

In general, earthwork for the proposed improvements should be performed in general accordance with guidelines provided in AC 150/5370-10G titled "Standards for Specifying Construction of Airports", Part II Earthwork (FAA, 2014) and the errata sheet for AC 150/5370-10G (FAA, 2016). The earthwork guidelines provided by the FAA are generic guidelines that should be "tailored" by the design engineer to meet the specific conditions of each project. Our preliminary recommendations for the geotechnical aspects of the project earthwork are presented below and should be incorporated into the project earthwork specifications.

7.1 SITE DEMOLITION, CLEARING AND PREPARATION

7.1.1 Site Stripping

The site should be stripped of all surface vegetation, and surface and subsurface improvements within the proposed development area. Demolition of existing improvements is discussed in detail below. Surface vegetation and topsoil should be stripped to a sufficient depth to remove all material greater than 3 percent organic content by weight. Based on our site observations, surficial stripping should extend about 4 to 6 inches below existing grade in vegetated areas. We anticipate that most of the required stripping will consist of tree and shrub removal, as addressed below. Organic laden stripping should be disposed off-site or stockpiled for re-use in landscape areas or otherwise designated in the project specifications.

7.1.2 Tree and Shrub Removal

Trees and shrubs designated for removal should have the rootballs and any roots greater than 1½-inch diameter removed completely. The depth of the excavations is anticipated to be on the order of 24 to 48 inches. Grade depressions resulting from rootball removal should be cleaned of loose material and backfilled in accordance with the recommendations in the "Compaction" section of this report.

7.1.3 Demolition of Existing Slabs, Foundations and Pavements

All slabs, foundations, and pavements should be completely removed from within planned improvement areas. Any material that cannot be reused as engineered fill should be disposed of as designated in the project specifications or as directed by the Engineer. A discussion of recycling existing improvements is provided later in this report.

7.1.4 Abandonment of Existing Utilities

All utilities not to remain as shown on the project plans and specifications should be completely removed from within planned improvement areas. All associated trench back fills should be

removed and replaced as engineered fill with the trench side slopes flattened to at least 1:1 (horizontal to vertical). The contractor should assume that all utilities will be removed from within improvement areas unless provided written confirmation from both the owner's representative and the engineer.

Utilities extending beyond the improvement areas may be abandoned in place provided the ends are plugged with concrete, they do not conflict with planned improvements, and that the trench fills do not pose significant risk to the planned surface improvements.

The risks associated with abandoning utilities in place include the potential for future differential settlement of existing trench fills, and/or partial collapse and potential ground loss into utility lines that are not completely filled with grout. The risk for each issue are relatively low for single utility lines less than 4 inches in diameter and increase with increasing pipe diameter.

7.2 REMOVAL OF EXISTING FILLS

As discussed, due to elevation differences, we understand 10-foot cuts are planned in the location of the new terminal building. Therefore, undocumented fills encountered are anticipated to be removed. However, if fills are encountered beneath the new terminal building or beneath the relocated hangers at the general aviation apron on the north side of the airport, the fills should be completely removed from within the building areas and to a lateral distance of at least 5 feet beyond the building footprints or to a lateral distance equal to fill depth below the perimeter footing, whichever is greater. Provided the fills meet the "Material for Fill" requirements below, the fills may be reused when backfilling the excavations. If materials are encountered that do not meet the requirements, such as debris, wood, trash, those materials should screened out of the remaining material and be removed from the site. Backfill of excavations should be placed in lifts and compacted in accordance with the "Compaction" section below.

Fills extending into planned pavement and flatwork areas may be left in place provided they are determined to be a low risk for future differential settlement and that the upper 12 to 18 inches of fill below pavement subgrade is re-worked and compacted as discussed in the "Compaction" section below.

7.3 TEMPORARY CUT AND FILL SLOPES

The contractor is responsible for maintaining all temporary slopes and providing temporary shoring where required. Temporary shoring, bracing, and cuts/fills should be performed in accordance with the strictest government safety standards. On a preliminary basis, the upper 10 feet may be classified as OSHA Soil Type C materials. A competent person should determine the actual soil classification during construction and be responsible for implementing and maintaining safe excavation slopes and/or shoring at the site during construction. Preliminary recommended soil parameters for temporary shoring are provided in the "Temporary Shoring" section below.

7.4 BELOW-GRADE EXCAVATIONS

As discussed, we understand 10-foot cuts will be required to transition existing grades down to the existing taxiway and runway levels and to the lower level of the terminal building. Below-grade excavations may be constructed with temporary slopes in accordance with the "Temporary Cut and Fill Slopes" section above if space allows. Alternatively, temporary shoring may support the planned cuts up to 15 feet. We have provided preliminary geotechnical parameters for shoring design in the section below. The choice of shoring method should be left to the contractor's judgment based on experience, economic considerations and adjacent improvements such as utilities, pavements, and foundation loads. Temporary shoring should support adjacent improvements without distress and should be the contractor's responsibility. A pre-condition survey including photographs and installation of monitoring points for existing site improvements should be included in the contractor's scope. We should be provided the opportunity to review the geotechnical parameters of the shoring design prior to implementation; the project structural engineer should be consulted regarding support of adjacent structures.

7.4.1 Temporary Shoring

Based on the site conditions encountered during our investigation, on a preliminary basis, the cuts may be supported by soldier beams and tie-backs, braced excavations, soil nailing, or potentially other methods. If soil nailing is desired, the contractor should likely plan on limited sections where excavations may be left open, potentially constructing the nails through temporary sloped cuts, and other similar measures for sandy soil conditions.

Where shoring will extend more than about 10 feet, restrained shoring will most likely be required to limit detrimental lateral deflections and settlement behind the shoring. In addition to soil earth pressures, the shoring system will need to support adjacent loads such as construction vehicles and incidental loading, existing structure foundation loads, and street loading. We recommend that heavy construction loads (cranes, etc.) and material stockpiles be kept at least 15 feet behind the shoring. Where this loading cannot be set back, the shoring will need to be designed to support the loading. The shoring designer should provide for timely and uniform mobilization of soil pressures that will not result in excessive lateral deflections. Preliminary minimum suggested geotechnical parameters for shoring design are provided in the table below.

Table 5: Preliminary Temporary Shoring Design Parameters

Design Parameter	Design Value
Minimum Lateral Wall Surcharge (upper 5 feet)	120 psf
Cantilever Wall – Triangular Earth Pressure	35 pcf
Restrained Wall – Uniform Earth Pressure	25H[(1)(2)]
Passive Pressure – Starting below the bottom of the adjacent excavation[(3)]	400 pcf up to 3,000 psf maximum uniform pressure

(1) H equals the height of the excavation; passive pressures are assumed to act over twice the soldier pile diameter
(2) The cantilever and restrained pressures are for drained designs. If undrained shoring is designed, an additional 40 pcf should be added for hydrostatic pressures.
(3) Bottom of adjacent excavation is bottom of mass excavation or bottom of footing excavation, whichever is deeper directly adjacent to the shoring element.

If shotcrete lagging is used for the shoring facing, the permanent retaining wall drainage materials, as discussed in the "Wall Drainage" section of this report, will need to be installed during temporary shoring construction. At a minimum, 2-foot-wide vertical panels should be placed between soil nails or tiebacks that are spaced at 6-foot centers. For 8-foot centers, 4-foot-wide vertical panels should be provided. A horizontal strip drain connecting the vertical panels should be provided, or pass-through connections should be included for each vertical panel.

We performed our borings with hollow-stem auger drilling equipment and as such were not able to evaluate the potential for caving soils, which can create difficult conditions during soldier beam, tie-back, or soil nail installation; caving soils can also be problematic during excavation and lagging placement. The contractor is responsible for evaluating excavation difficulties prior to construction. Where relatively clean sands were encountered during our exploration, pilot holes performed by the contractor may be desired to further evaluate these conditions prior to the finalization of the shoring budget.

As previously mentioned, we recommend that a monitoring program be developed and implemented to evaluate the effects of the shoring on adjacent improvements. All sensitive improvements should be located and monitored for horizontal and vertical deflections and distress cracking based on a pre-construction survey.

The above recommendations are for the use of the design team; the contractor in conjunction with input from the shoring designer should perform additional subsurface exploration they deem necessary to design the chosen shoring system. A California-licensed civil or structural engineer must design and be in responsible charge of the temporary shoring design. The contractor is responsible for means and methods of construction, as well as site safety.

Based on our borings and depth to ground water encountered, ground water is anticipated to be below the bottom of anticipated 10-foot cuts and appears as though will not affect shoring design. However, depth to ground water and potential effects on shoring should be further evaluated during a design-level investigation.

The above considerations are for the use of the design team during conceptual planning and preliminary design. Additional subsurface exploration and engineering analysis should be performed during the design-level geotechnical investigation to develop final shoring design parameters, as needed. A California-licensed civil or structural engineer must design and be in responsible charge of the temporary shoring design.

7.5 SUBGRADE PREPARATION

After site clearing and demolition is complete, and prior to backfilling any excavations that extend below the excavation plane for the subgrade resulting from fill removal or demolition, the excavation subgrade and subgrade within areas to receive additional site fills should be scarified to a depth of 6 inches, moisture conditioned, and compacted in accordance with the "Compaction" section below. Further recommendations for preparation of subgrade in pavement areas is discussed in Sections 7.6 and 7.7.

Sandy subgrades that are allowed to dry out after compaction will be subject to disturbance by both foot and vehicle traffic. In pavement areas, we recommend that aggregate base sections be placed immediately after the subgrade is prepared to reduce rework. In building areas, we recommend that subgrade compaction and proof rolling be performed within 24 hours of capillary break layer or slab-on-grade construction to reduce rework.

7.6 SUBGRADE STABILIZATION FOR TERMINAL APRON AND TAXIWAY AREAS USING CEMENT TREATMENT

Native soil and undocumented fill materials, especially soils with high fines contents such as clays, silts, clayey sands and silty sands, can become unstable due to high moisture content, whether from high in-situ moisture contents, winter rains, or overwatering during construction. As the moisture content increases over the laboratory optimum, more likely the materials will be subject to softening and yielding (pumping) from construction loading or become unworkable during placement and compaction. Due to the variable soil conditions potential at the terminal apron subgrade, potential for unstable conditions to arise during over-excavation and subgrade grading, and to increase the design subgrade CBR, we recommend the upper 18 inches of the terminal apron and taxiway subgrade be cement treated. This will also enable a firm and stable working surface for construction activities.

7.7 SUBGRADE STABILIZATION MEASURES FOR THE GENERAL AVIATION AREAS USING CEMENT TREATMENT

As discussed above, native soil and undocumented fill materials, especially soils with high fines contents such as clays, silts, clayey sands and silty sands, can become unstable due to high moisture content, whether from high in-situ moisture contents, winter rains, or overwatering during construction. As the moisture content increases over the laboratory optimum, more likely the materials will be subject to softening and yielding (pumping) from construction loading or become unworkable during placement and compaction. Due to the variable soil conditions potential at the general aviation pavement subgrade areas, potential for unstable conditions to arise during over-excavation and subgrade grading, and to increase the design subgrade CBR,

we recommend the upper 12 inches of the general aviation pavement subgrade be cement treated. This will also enable a firm and stable working surface for construction activities.

7.8 SUBGRADE STABILIZATION MEASURES FOR GENERAL NON-TERMINAL APRON AREAS

As discussed in the section above, native soil and undocumented fill materials, especially soils with high fines contents such as clays, silts, clayey sands and silty sands, can become unstable due to high moisture content, whether from high in-situ moisture contents, winter rains, or overwatering during construction. As the moisture content increases over the laboratory optimum, more likely the materials will be subject to softening and yielding (pumping) from construction loading or become unworkable during placement and compaction.

There are several methods to address potentially unstable soil conditions and facilitate fill placement and trench backfill. Some of these methods are briefly discussed below. Implementation of the appropriate stabilization measures should be evaluated on a case-by-case basis according to the project construction goals and the particular site conditions.

7.8.1 Scarification and Drying

The subgrade may be scarified to a depth of 6 to 12 inches and allowed to dry to near optimum conditions, if sufficient dry weather is anticipated to allow sufficient drying. More than one round of scarification may be needed to break up the soil clods.

7.8.2 Removal and Replacement

As an alternative to scarification, the contractor may choose to over-excavate the unstable soils and replace them with dry on-site or import materials. A Cornerstone representative should be present to provide recommendations regarding the appropriate depth of over-excavation, whether a geosynthethic (stabilization fabric or geogrid) is recommended, and what materials are recommended for backfill.

7.8.3 Chemical Treatment

Where the unstable area exceeds about 5,000 to 10,000 square feet and/or site winterization is desired, chemical treatment with cement may be more cost-effective than removal and replacement. Recommended chemical treatment depths will typically range from 12 to 18 inches depending on the magnitude of the instability.

7.9 MATERIAL FOR FILL

7.9.1 Re-Use of On-site Soils

On-site soils with an organic content less than 3 percent by weight may be reused as general fill. General fill should not have lumps, clods or cobble pieces larger than 6 inches in diameter; 85 percent of the fill should be smaller than 2½ inches in diameter. Minor amounts of oversized

material (smaller than 12 inches in diameter) may be allowed provided the oversized pieces are not allowed to nest together, and the compaction method will allow for loosely placed lifts not exceeding 12 inches. Also note that during summer months and dry months, these soils will need a large amount of water and mixing to raise the moisture content to a compactable range.

7.9.2 Re-Use of On-Site Site Improvements

We anticipate that asphalt concrete (AC) grindings and aggregate base (AB) will be generated during site demolition. If the AC grindings are mixed with the underlying AB to meet project specifications, they may be reused within the new pavement structural sections. AC/AB grindings may not be reused beneath the terminal building areas. Laboratory testing will be required to confirm the grindings meet project specifications.

If the site area allows for on-site pulverization of PCC and provided the PCC is pulverized to meet the "Material for Fill" requirements discussed within this report, it may be used as select fill within the terminal building areas, excluding the capillary break layer, and pavement structural sections baring the pulverized PCC meets project specifications. Laboratory testing will be required to confirm the grindings meet project specifications. PCC grindings also make good winter construction access roads, similar to a cement-treated base (CTB) section.

7.9.3 Potential Import Sources

Imported material should be inorganic with a Plasticity Index (PI) of 15 or less, and not contain recycled asphalt concrete where it will be used within the terminal building or other habitable areas. To prevent significant caving during trenching or foundation construction, imported material should have sufficient fines. Samples of potential import sources should be delivered to our office at least 10 days prior to the desired import start date. Information regarding the import source should be provided, such as any site geotechnical reports. If the material will be derived from an excavation rather than a stockpile, potholes will likely be required to collect samples from throughout the depth of the planned cut that will be imported. At a minimum, laboratory testing will include PI tests. Material data sheets for select fill materials (P-208 Aggregate Base Course, etc.) listing current laboratory testing data (not older than 1 month from the import date) may be provided for our review without providing a sample. If current data is not available, specification testing will need to be completed prior to approval.

Environmental and soil corrosion characterization should also be considered by the project team prior to acceptance. Suitable environmental laboratory data to the planned import quantity should be provided to the project environmental consultant; additional laboratory testing may be required based on the project environmental consultant's review. The potential import source should also not be more corrosive than the on-site soils, based on pH, saturated resistivity, and soluble sulfate and chloride testing.

7.10 COMPACTION REQUIREMENTS

All fills, and subgrade areas where fill, slabs-on-grade, and pavements are planned, should be placed in loose lifts 8 inches thick or less and compacted in accordance with ASTM D1557

(latest version) requirements as shown in the table below. In general, clayey soils should be compacted with sheepsfoot equipment and sandy/gravelly soils with vibratory equipment; open-graded materials such as Class 2 Permeable Material should be placed in lifts no thicker than 18 inches and consolidated in place with vibratory equipment. Each lift of fill and all subgrade should be firm and unyielding under construction equipment loading in addition to meeting the compaction requirements to be approved. The contractor (with input from the Engineer or a Cornerstone representative) should evaluate the in-situ moisture conditions, as the use of vibratory equipment on soils with high moistures can cause unstable conditions. General recommendations for soil stabilization are provided in the "Subgrade Stabilization Measures" section of this report.

Table 6: Compaction Requirements – Mass Grading and Building Areas

Description	Material Description	Minimum Relative[1] Compaction (percent)	Moisture[2] Content (percent)
General Fill (within upper 5 feet)	On-Site Soils	90	>1
General Fill (below upper 5 feet)	On-Site Soils	95	>1
Retaining Wall Backfill	Without Surface Improvements	90	>1
Retaining Wall Backfill	With Surface Improvements	95	0 to 2
Trench Backfill (upper 6 inches of subgrade)	On-Site Soils	95	0 to 2
Trench Backfill (below upper 6 inches of subgrade)	On-Site Soils	90	>1
Drainage Rock	Caltrans Class 2 Permeable Material	Consolidate In-Place	NA
Pavement Subgrade (upper 6 inches of subgrade)	On-Site Soils	95	0 to 2
Pavement Aggregate Base	Caltrans Class II AB[3]	95	Optimum
Asphalt Concrete	Asphalt Concrete	95 (Marshall)	NA

1 – Relative compaction based on maximum density determined by ASTM D1557 (latest version)
2 – Moisture content based on optimum moisture content determined by ASTM D1557 (latest version)
3 – Class 2 aggregate base shall conform to Caltrans Standard Specifications, latest edition, except that the relative compaction should be determined by ASTM D1557 (latest version)

Table 7: Compaction Requirements – Terminal Apron, Taxiway, and General Aviation

Description	Material Description	Minimum Relative[1] Compaction (percent)	Moisture[2] Content (percent)
General Aviation AC Pavement Cement Treated Subgrade[3] (0 to 12 inches)	On-Site Soils	93	0 to 4
Terminal Apron and Taxiway PCC/AC Pavement Cement Treated Subgrade[3] (0 to 18 inches)	On-Site Soils	93	0 to 4
Pavement Aggregate Base	P-209 Crushed AB	100	Optimum
Asphalt Concrete (Base Course)	P-401 AC	As recommended by FAA	NA
Asphalt Concrete (Surface Course)	P-401 AC	As recommended by FAA	NA
Asphalt Concrete	P-403 AC	As recommended by FAA	NA

1 – Relative compaction based on maximum density determined by ASTM D1557 (latest version)
2 – Moisture content based on optimum moisture content determined by ASTM D1557 (latest version)
3 – Cement treatment of the upper 12 to 18 inches of pavement subgrade will be required. Cement treat 12 inches in general aviation area and 18 inches in terminal apron and taxiway areas.

7.9.1 Construction Moisture Conditioning

Based on our previous experience at the Monterey Regional Airport, to achieve compaction of the sandy soils, we anticipate significant amounts of water will be required to moisture condition the soils. The contractor should anticipate needing to add significant moisture and thoroughly mixing the sandy soils to achieve the proper compaction.

7.10 TRENCH BACKFILL

All utility lines should be bedded and shaded to at least 6 inches over the top of the lines with well-graded sand and gravel materials conforming to the pipe manufacturer's requirements. Open-graded materials should not be used. Well-graded materials should be compacted to at least 90 percent relative compaction with vibratory equipment prior to placing subsequent backfill materials.

General backfill over shading materials may consist of on-site native materials provided they meet the requirements in the "Material for Fill" section, and are moisture conditioned and compacted in accordance with the requirements in the "Compaction" section.

Where utility lines will cross perpendicular to strip footings, the footing should be deepened to encase the utility line, providing sleeves or flexible cushions to protect the pipes from anticipated foundation settlement, or the utility lines should be backfilled to the bottom of footing with sand-cement slurry or lean concrete. Where utility lines will parallel footings and will extend below the

"foundation plane of influence," an imaginary 1:1 plane projected down from the bottom edge of the footing, either the footing will need to be deepened so that the pipe is above the foundation plane of influence or the utility trench will need to be backfilled with sand-cement slurry or lean concrete within the influence zone. Sand-cement slurry used within foundation influence zones should have a minimum compressive strength of 75 psi.

As discussed above, the native soils generally consist of sands with little to some silt and clay fines. Trench excavations will likely not stand vertical and will require temporary slopes or shields, if vertical excavations are needed.

7.11 PERMANENT CUT AND FILL SLOPES

All permanent cut slopes in native soil and fill slopes constructed of native sandy soils should have a maximum inclination of 3:1 (horizontal:vertical). Fill slopes should be overbuilt and trimmed back, exposing engineered fill when complete. Refer to the "Erosion Control" section of this report for a discussion regarding protection of slope surfaces.

7.11.1 Keyways and Benches

Fill placed on existing ground inclined at 6:1 or greater should be benched into the existing slope and a keyway constructed at the toe of the fill. Benches should be angled into the slope (minimum 2 percent inclination), be spaced vertically at no greater than 10 feet between benches, be at least 5 feet wide, and extend at least 5 feet laterally into competent materials, whichever is greater. Depending on the soils encountered, the benches may need to be widened beyond the minimum width to extend into competent soils. The keyway should also be angled slightly into the slope (minimum 2 percent inclination), extend at least 5 to 10 feet below grade and at least 2 feet into competent material, whichever is greater, and be at least 25 feet wide. The side slopes of all keyways and benches should be no steeper than 1:1 and may need to be flattened in localized areas if loose unstable sands are encountered.

As previously discussed in the slope stability section of this report, a keyway and benching should be constructed for the proposed fill slope from placement of the cut material for relocation of the terminal building and apron. Typical keyway and benching is depicted in Figure 5 for Cross Section A-A'.

The above recommendations are preliminary and additional analysis and recommendations should be performed and provided during a design-level investigation.

7.12 SITE DRAINAGE

Surface runoff should not be allowed to flow over the top of or pond at the top or toe of engineered slopes or retaining walls. Ponding should also not be allowed on or adjacent to building foundations, slabs-on-grade, pavements, or concrete flatwork. Surface drainage should be directed towards suitable drainage facilities such as lined v-ditches or drain inlets. Hardscape surfaces should slope at least 1 percent towards suitable discharge facilities; landscape areas should slope at least 2 percent towards suitable discharge facilities unless

specified otherwise by the project engineer. Roof runoff should be directed away from building areas in closed conduits, to approved infiltration facilities, or on to hardscaped surfaces that drain to suitable facilities. Lined v-ditches should be included at the top of slopes. All v-ditches and drain inlets should be sized to accommodate the design storm events for the upslope tributary area. Concrete-lined v-ditches should be reinforced as required and have adequate control and construction joints, and should be constructed neat in excavations; backfill around formed ditches should not be allowed.

7.13 PERMANENT EROSION CONTROL MEASURES

At a minimum all slopes should be vegetated by hydroseeding or other landscape ground cover. The establishment of vegetation will help reduce runoff velocities, allow some infiltration and transpiration, trap sediment within runoff, and protect the soil from raindrop impact. In addition, more aggressive erosion control measures will likely be needed to protect slopes for one or more winter seasons while vegetation is establishing. This may consist of straw matting, or erosion control blankets used in combination with planting.

Both construction and post-construction Storm Water Pollution Prevention Plans (SWPPPs) should be prepared for the project-specific requirements.

7.14 LANDSCAPE CONSIDERATIONS

Since the site soils are generally erosive, we recommend that the landscaping plan address permanent erosion control measures. This can typically be achieved by:

- Using drip irrigation in lieu of spray,
- Regulating the amount of water distributed to planter areas by using irrigation timers, and
- Selecting landscaping that requires little or no watering.

We recommend that the landscape architect consider these items when developing landscaping plans.

SECTION 8: PRELIMINARY FOUNDATION RECOMMENDATIONS

8.1 SUMMARY OF RECOMMENDATIONS

On a preliminary basis, in our opinion, the proposed terminal building and relocated hangers may be supported on shallow foundations.

8.2 SEISMIC DESIGN CRITERIA

The 2016 California Building Code (CBC) provides criteria for the seismic design of buildings in Chapter 16. The “Seismic Coefficients” used to design buildings are established based on a

series of tables and figures addressing different site factors, including the soil profile in the upper 100 feet below grade and mapped spectral acceleration parameters based on distance to the controlling seismic source/fault system. Based on our borings and review of local geology, the site is underlain by quaternary deposits with typical SPT "N" values between 15 and 50 blows per foot. Therefore, we have classified the site as Soil Classification C. The mapped spectral acceleration parameters S_S and S_1 were calculated using the USGS computer program *U.S. Seismic Design Maps*, located at http://earthquake.usgs.gov/designmaps/us/application.php, based on the site coordinates presented below and the site classification. The table below lists the various factors used to determine the seismic coefficients and other parameters.

Table 8: CBC Site Categorization and Site Coefficients

Classification/Coefficient	Design Value
Site Class	D
Site Latitude	36.58551°
Site Longitude	-121.8477°
0.2-second Period Mapped Spectral Acceleration[1], S_S	1.488g
1-second Period Mapped Spectral Acceleration[1], S_1	0.543g
Short-Period Site Coefficient – Fa	1.0
Long-Period Site Coefficient – Fv	1.5
0.2-second Period, Maximum Considered Earthquake Spectral Response Acceleration Adjusted for Site Effects - S_{MS}	1.488g
1-second Period, Maximum Considered Earthquake Spectral Response Acceleration Adjusted for Site Effects – S_{M1}	0.814g
0.2-second Period, Design Earthquake Spectral Response Acceleration – S_{DS}	0.992g
1-second Period, Design Earthquake Spectral Response Acceleration – S_{D1}	0.543g
Mapped MCE Geometric Mean Peak Ground Acceleration – PGA_M	0.576g
Site Coefficient Based on PGA and Site Class - F_{PGA}	1.0

[1]For Site Class B, 5 percent damped.

8.3 SHALLOW FOUNDATIONS

8.3.1 Spread Footings

On a preliminary basis, the terminal building and relocated hangers may be supported on spread footings, which should bear on natural, undisturbed soil or engineered fill, be at least 24 inches wide, and extend at least 18 to 24 inches below the lowest adjacent grade. Lowest adjacent grade is defined as the deeper of the following: 1) bottom of the adjacent interior slab-on-grade, or 2) finished exterior grade, excluding landscaping topsoil.

On a preliminary basis, terminal building and parking structure footings constructed to the above dimensions are capable of supporting maximum allowable bearing pressures of 2,500 psf for

dead loads, 3,750 psf for combined dead plus live loads, and 5,000 psf for all loads including wind and seismic. On a preliminary basis, the relocated hanger building footings constructed to the above dimensions are capable of supporting maximum allowable bearing pressures of 2,000 psf for dead loads, 3,000 psf for combined dead plus live loads, and 4,000 psf for all loads including wind and seismic. The above pressures are based on factors of safety of 3.0, 2.0, and 1.5 applied to the ultimate bearing pressure for dead, dead plus live, and all loads, respectively. These pressures are net values; the weight of the footing may be neglected for the portion of the footing extending below grade (typically, the full footing depth). Top and bottom mats of reinforcing steel should be included in continuous footings to help span irregularities and differential settlement.

8.3.2 Footing Settlement

Structural loads were not provided to us at the time this report was prepared; therefore, we assumed the typical loading in the following table.

Table 9: Assumed Structural Loading

Foundation Area	Range of Assumed Loads
Terminal Building Interior Isolated Column Footing	200 to 300 kips
Terminal Building Exterior Isolated Column Footing	100 to 150 kips
Parking Structure Interior Isolated Column Footing	300 to 400 kips
Parking Structure Exterior Isolated Column Footing	150 to 200 kips
Relocated Hanger Buildings Isolated Column Footing	100 to 150 kips

On a preliminary basis and based on the above loading and the allowable bearing pressures presented above, we estimate that the total static footing settlement will be on the order of ⅔-inch for the terminal building, with about ⅓-inch of post-construction differential settlement between adjacent foundation elements. As mentioned, we understand site grades will be cut about 10 to 12 feet to the lower level of the terminal building. Based on this understanding, we estimate differential seismic movement from liquefaction and dry sand shaking below the bottom of proposed building will be on the order of ¼- to ⅓-inch between independent foundation elements, resulting in a total estimated differential footing movement of up to about ½- to ⅔-inch between foundation elements.

On a preliminary basis and based on the above loading and the allowable bearing pressures presented above, we estimate that the total static footing settlement will be on the order of 1-inch for the parking structure, with about ½-inch of post-construction differential settlement between adjacent foundation elements. As mentioned, we understand the parking structure will be at-grade. Based on this understanding, we estimate differential seismic movement from liquefaction and dry sand shaking below the bottom of parking structure will be on the order of ½-inch between independent foundation elements, resulting in a total estimated differential footing movement of up to about 1-inch between foundation elements.

On a preliminary basis and based on the above loading and the allowable bearing pressures presented above, we estimate that the total static footing settlement will be on the order of ½-inch for the relocated hangers, with about ¼-inch of post-construction differential settlement between adjacent foundation elements. In addition, we estimate differential seismic movement from dry sand shaking will be on the order of ¼-inch between independent foundation elements, resulting in a total estimated differential footing movement of up to about ½-inch between foundation elements.

As our footing loads were assumed and the depth of footings below existing grades for the terminal building are not know at this time, we recommend footing settlements be further evaluated for all buildings during a design level investigation.

8.3.3 Lateral Loading

Lateral loads may be resisted by friction between the bottom of footing and the supporting subgrade, and also by passive pressures generated against footing sidewalls. On a preliminary basis, an ultimate frictional resistance of 0.4 applied to the footing dead load, and an ultimate passive pressure based on an equivalent fluid pressure of 400 pcf may be used in design. The structural engineer should apply an appropriate factor of safety to the ultimate values above. Where footings are adjacent to landscape areas without hardscape, the upper 12 inches of soil should be neglected when determining passive pressure capacity.

8.3.4 Spread Footing Construction Considerations

Cohesionless sands will likely be encountered within footing excavations. Excavation walls may not stand vertical and may need to be sloped to a minimum 1:1 inclination where footings are located within sands or Stay-Form or similar be placed within the footing excavations as they are excavated during construction of the foundation elements. Granular material encountered in the footing bottoms will likely be disturbed to a depth of 6 to 8 inches following excavation and will need to be consolidated with vibratory equipment prior to steel placement. Care should be taken to not disturb the compacted granular material during steel placement. Footing excavations should also be kept moist by regular sprinkling with water to prevent desiccation and potential raveling of the granular materials. As an alternative, a rat slab can be placed over the granular material to protect the granular material prior to steel placement.

SECTION 9: PRELIMINARY PAVEMENT RECOMMENDATIONS

9.1 CONCRETE TERMINAL APRON AND GENERAL AVIATION APRON

The pavement design analysis for the new terminal apron and general aviation apron will be performed with the computer program FAARFIELD by Kimley Horn and Associates, Inc. using geotechnical design parameters recommended by Cornerstone Earth Group. Based on the results of our CBR tests and engineering judgement, on a preliminary basis we recommend a design CBR of 10 be used. Based on this information and discussions with Kimley Horn and Associates, Inc., preliminary pavement designs are as follows:

- Terminal Apron (PCC) – 13 inches PCC over 5 inches P-401/P403 over 6 inches P-209 over 18 inches cement treated subgrade (modulus = 30,000)

- Terminal Apron (Bitumnous Concrete (AC)) – 4 inches P-401 over 5 inches P-401/P403 over 6 inches P-209 (6 inch Minimum) over 18 inches cement treated subgrade (modulus = 30,000)

- General Aviation Apron – 4 inches P-403 over 5 inches P-209 over 12 inches cement treated subgrade (modulus = 30,000).

SECTION 10: PRELIMINARY RETAINING WALL RECOMMENDATIONS

As previously discussed, we understand approximately 10-foot cuts with retaining walls are planned to retain existing soils and transition existing grades down to the existing taxiway and runway levels for the proposed terminal apron and terminal building. The following sections provide preliminary retaining wall recommendations for the anticipated retaining walls.

10.1 STATIC LATERAL EARTH PRESSURES

The structural design of any site retaining wall should include resistance to lateral earth pressures that develop from the soil behind the wall, any undrained water pressure, and surcharge loads acting behind the wall. Provided a drainage system is constructed behind the wall to prevent the build-up of hydrostatic pressures as discussed in the section below, we recommend that the walls with level backfill be designed for the following pressures:

Table 10: Recommended Lateral Earth Pressures

Wall Condition	Lateral Earth Pressure*	Additional Surcharge Loads
Unrestrained – Cantilever Wall	35 pcf	⅓ of vertical loads at top of wall
Restrained – Braced Wall	35 pcf + 8H** psf	½ of vertical loads at top of wall

* Lateral earth pressures are based on an equivalent fluid pressure for level backfill conditions
** H is the distance in feet between the bottom of footing and top of retained soil

If adequate drainage cannot be provided behind the wall, an additional equivalent fluid pressure of 40 pcf should be added to the values above for both restrained and unrestrained walls for the portion of the wall that will not have drainage. Damp proofing or waterproofing of the walls may be considered where moisture penetration and/or efflorescence are not desired.

10.2 SEISMIC LATERAL EARTH PRESSURES

10.2.1 Restrained Basement Walls

Retaining walls for the lower level of the new terminal building will likely be required. As mentioned, 10-foot cuts are anticipated and as such the lower level new terminal building walls may be 10 to 12 feet in height. The 2016 California Building Code (CBC) states that lateral

pressures from earthquakes should be considered in the design of basements and retaining walls. We developed preliminary seismic earth pressures for the proposed terminal building basement (lower level) wall using interim recommendations generally based on refinement of the Mononobe-Okabe method (Lew et al., SEAOC 2010). Because the walls may be 12 feet in height, and peak ground accelerations are greater than 0.40g, we checked the result of the seismic increment when added to the recommended active earth pressure against the recommended fixed wall earth pressures. Basement walls are not free to deflect, and should therefore be designed for static conditions as a restrained wall, which is also a CBC requirement. Based on our preliminary analysis and current recommendations for seismic earth pressures, it appears that active earth pressures plus a seismic increment exceed the restrained (i.e. at-rest), static wall earth pressures. Therefore, we recommend checking the walls for the seismic condition in accordance with the interim recommendations of the above referenced paper and the 2013 CBC.

The CBC prescribes basic load combinations for structures, components and foundations with the intention that their design strength equals or exceeds the effects of the factored loads. With respect to the load from lateral earth pressure and ground water pressure, the CBC prescribes the basic combinations shown in CBC equations 16-2 and 16-7 below.

$1.2(D + F) + 1.6(L + H) + 0.5(L_r \text{ or } S \text{ or } R)$ [Eq. 16-2]

In Eq. 16-2: H - should represent the total static lateral earth pressure, which for the basement wall will be restrained (use 45 pcf + 8H psf)

$0.9(D + F) + 1.0E + 1.6H$ [Eq. 16-7]

In Eq. 16-7: H - Should represent the static “active” earth pressure component under seismic loading conditions (use 45 pcf).

E - Should represent the seismic increment component in Eq. 16-7. On a preliminary basis, a seismic increment component equal to a triangular load with a resultant force of $4.5H^2$, which should be applied one third of the height up from the base of the wall (and which can also be expressed as an equivalent fluid pressure equal to 9 pcf) can be utilized for restrained basement walls. During a design level investigation, the seismic increment component should be further evaluated.

The interim recommendations in the SEAOC paper more appropriately split out "active" earth pressure (and not the restrained ["at-rest"] pressure) from our report and provide the total seismic increment so that different load factors can be applied in accordance with different risk levels.

10.2.2 Unrestrained Site Walls

Unrestrained site retaining walls up to approximately 10 feet in height may be constructed. The 2016 CBC states that lateral pressures from earthquakes should be considered in the design of basements and retaining walls. Because the walls are greater than about 6 feet, and peak ground accelerations greater than 0.40g are expected, we recommend checking the walls for

the seismic condition in accordance with the interim recommendations from the SEAOC (2010) paper and the 2016 CBC.

The CBC prescribes basic load combinations for structures, components and foundations with the intention that their design strength equals or exceeds the effects of the factored loads. With respect to the load from lateral earth pressure and ground water pressure, the CBC prescribes the basic combinations shown in CBC equations 16-2 and 16-7 below.

$1.2(D + F) + 1.6(L + H) + 0.5(L_r \text{ or } S \text{ or } R)$ [Eq. 16-2]

In Eq. 16-2: H - should represent the total static lateral earth pressure, which for the site walls will be unrestrained (use 45 pcf)

$0.9(D + F) + 1.0E + 1.6H$ [Eq. 16-7]

In Eq. 16-7: H - Should represent the static "active" earth pressure component under seismic loading conditions (use 45 pcf).

E - Should represent the seismic increment component in Eq. 16-7. On a preliminary basis, a seismic increment component equal to a triangular load with a resultant force of $12.5H^2$, which should be applied one third of the height up from the base of the wall (and which can also be expressed as an equivalent fluid pressure equal to 25 pcf) can be utilized for unrestrained site walls. During a design level investigation, the seismic increment component should be further evaluated.

The interim recommendations in the SEAOC paper more appropriately split out "active" earth pressure from the seismic earth pressure increment so that different load factors can be applied in accordance with different risk levels.

10.3 WALL DRAINAGE

10.3.1 At-Grade Site Walls

Adequate drainage should be provided by a subdrain system behind all walls. This system should consist of a 4-inch minimum diameter perforated pipe placed near the base of the wall (perforations placed downward). The pipe should be bedded and backfilled with Class 2 Permeable Material per Caltrans Standard Specifications, latest edition. The permeable backfill should extend at least 12 inches out from the wall and to within 2 feet of outside finished grade. Alternatively, ½-inch to ¾-inch crushed rock may be used in place of the Class 2 Permeable Material provided the crushed rock and pipe are enclosed in filter fabric, such as Mirafi 140N or approved equivalent. The upper 2 feet of wall backfill should consist of compacted on-site soil. The subdrain outlet should be connected to a free-draining outlet or sump.

Miradrain, Geotech Drainage Panels, or equivalent drainage matting can be used for wall drainage as an alternative to the Class 2 Permeable Material or drain rock backfill. Horizontal strip drains connecting to the vertical drainage matting may be used in lieu of the perforated pipe and crushed rock section. The vertical drainage panel should be connected to the perforated pipe or horizontal drainage strip at the base of the wall, or to some other closed or

through-wall system such as the TotalDrain system from AmerDrain. Sections of horizontal drainage strips should be connected with either the manufacturer's connector pieces or by pulling back the filter fabric, overlapping the panel dimples, and replacing the filter fabric over the connection. At corners, a corner guard, corner connection insert, or a section of crushed rock covered with filter fabric must be used to maintain the drainage path.

Drainage panels should terminate 18 to 24 inches from final exterior grade. The Miradrain panel filter fabric should be extended over the top of and behind the panel to protect it from intrusion of the adjacent soil.

10.3.2 Below-Grade Walls

Miradrain, AmerDrain or other equivalent drainage matting should be used for wall drainage where below-grade walls are temporarily shored and the shoring will be flush with the back of the permanent walls. The drainage panel should be connected at the base of the wall by a horizontal drainage strip and closed or through-wall system such as the TotalDrain system from AmerDrain.

Sections of horizontal drainage strips should be connected with either the manufacturer's connector pieces or by pulling back the filter fabric, overlapping the panel dimples, and replacing the filter fabric over the connection. At corners, a corner guard, corner connection insert, or a section of crushed rock covered with filter fabric must be used to maintain the drainage path.

Drainage panels should terminate 18 to 24 inches from final exterior grade unless capped by hardscape. The drainage panel filter fabric should be extended over the top of and behind the panel to protect it from intrusion of the adjacent soil. If the shoring system will be offset behind the back of permanent wall, the drainage systems discussed in the "At-Grade Site Walls" section may also be used.

10.4 BACKFILL

Where surface improvements will be located over retaining wall backfill, backfill placed behind the walls should be compacted to at least 95 percent relative compaction using light compaction equipment. Where no surface improvements are planned, backfill should be compacted to at least 90 percent. If heavy compaction equipment is used, the walls should be temporarily braced.

Consideration should be given to the transitions from on-grade to on-structure. Subslabs or other methods for reducing differential movement of flatwork or pavements across this transition should be included in the project design.

10.5 FOUNDATIONS

On a preliminary basis, site retaining walls and basement retaining walls for the lower level of the terminal building may be supported on a continuous spread footings designed in accordance

with the preliminary recommendations presented in the “Preliminary Foundations” section of this report.

SECTION 11: LIMITATIONS

This report, an instrument of professional service, has been prepared for the sole use of Kimley-Horn and Associates, Inc. specifically to support the design of the Monterey Peninsula Airport Terminal Building, Apron Area, and North Side Improvements Areas project in Monterey, California. The opinions, conclusions, and recommendations presented in this report have been formulated in accordance with accepted geotechnical engineering practices that exist in Northern California at the time this report was prepared. No warranty, expressed or implied, is made or should be inferred.

Recommendations in this report are based upon the soil and ground water conditions encountered during our subsurface exploration. If variations or unsuitable conditions are encountered during construction, Cornerstone must be contacted to provide supplemental recommendations, as needed.

Kimley-Horn and Associates, Inc. may have provided Cornerstone with plans, reports and other documents prepared by others. Kimley-Horn and Associates, Inc. understands that Cornerstone reviewed and relied on the information presented in these documents and cannot be responsible for their accuracy.

Cornerstone prepared this report with the understanding that it is the responsibility of the owner or his representatives to see that the recommendations contained in this report are presented to other members of the design team and incorporated into the project plans and specifications, and that appropriate actions are taken to implement the geotechnical recommendations during construction.

Conclusions and recommendations presented in this report are valid as of the present time for the development as currently planned. Changes in the condition of the property or adjacent properties may occur with the passage of time, whether by natural processes or the acts of other persons. In addition, changes in applicable or appropriate standards may occur through legislation or the broadening of knowledge. Therefore, the conclusions and recommendations presented in this report may be invalidated, wholly or in part, by changes beyond Cornerstone’s control. This report should be reviewed by Cornerstone after a period of three (3) years has elapsed from the date of this report. In addition, if the current project design is changed, then Cornerstone must review the proposed changes and provide supplemental recommendations, as needed.

An electronic transmission of this report may also have been issued. While Cornerstone has taken precautions to produce a complete and secure electronic transmission, please check the electronic transmission against the hard copy version for conformity.

Recommendations provided in this report are based on the assumption that Cornerstone will be retained to provide observation and testing services during construction to confirm that

conditions are similar to that assumed for design, and to form an opinion as to whether the work has been performed in accordance with the project plans and specifications. If we are not retained for these services, Cornerstone cannot assume any responsibility for any potential claims that may arise during or after construction as a result of misuse or misinterpretation of Cornerstone's report by others. Furthermore, Cornerstone will cease to be the Geotechnical-Engineer-of-Record if we are not retained for these services.

CORNERSTONE EARTH GROUP

APPENDIX A: FIELD INVESTIGATION

The field investigation consisted of a surface reconnaissance and a subsurface exploration program using concrete core drilling equipment and truck-mounted, hollow-stem auger drilling equipment. Nineteen 8-inch-diameter exploratory borings were drilled on December 11 to December 14, 2016 to depths of 10½ to 40 feet. Twelve pavement cores were drilled on December 11 and 12, 2016 at Boring EB-6 to EB-17 locations. Approximate exploratory boring locations are shown on the Site Plan, Figure 2. The soils encountered were continuously logged in the field by our representative and described in accordance with the Unified Soil Classification System (ASTM D2488). Boring logs, as well as a key to the classification of the soil, are included as part of this appendix.

Boring locations were approximated using existing site boundaries, existing buildings, and other site features as references. Boring elevations were interpolated using the autocad file provided showing existing contours (datum unknown). The locations of the borings should be considered accurate only to the degree implied by the method used.

Representative soil samples were obtained from the borings at selected depths. All samples were returned to our laboratory for evaluation and appropriate testing. The standard penetration resistance blow counts were obtained by dropping a 140-pound hammer through a 30-inch free fall. The 2-inch O.D. split-spoon sampler was driven 18 inches and the number of blows was recorded for each 6 inches of penetration (ASTM D1586). 2.5-inch I.D. samples were obtained using a Modified California Sampler driven into the soil with the 140-pound hammer previously described. Unless otherwise indicated, the blows per foot recorded on the boring log represent the accumulated number of blows required to drive the last 12 inches. The various samplers are denoted at the appropriate depth on the boring logs.

Field tests included an evaluation of the unconfined compressive strength of the soil samples using a pocket penetrometer device. The results of these tests are presented on the individual boring logs at the appropriate sample depths.

Attached boring logs and related information depict subsurface conditions at the locations indicated and on the date designated on the logs. Subsurface conditions at other locations may differ from conditions occurring at these boring locations. The passage of time may result in altered subsurface conditions due to environmental changes. In addition, any stratification lines on the logs represent the approximate boundary between soil types and the transition may be gradual.

UNIFIED SOIL CLASSIFICATION (ASTM D-2487-98)

MATERIAL TYPES	CRITERIA FOR ASSIGNING SOIL GROUP NAMES			GROUP SYMBOL	SOIL GROUP NAMES & LEGEND
COARSE-GRAINED SOILS >50% RETAINED ON NO. 200 SIEVE	GRAVELS >50% OF COARSE FRACTION RETAINED ON NO 4. SIEVE	CLEAN GRAVELS <5% FINES	Cu>4 AND 1<Cc<3	GW	WELL-GRADED GRAVEL

APPENDIX B: LABORATORY TEST PROGRAM

The laboratory testing program was performed to evaluate the physical and mechanical properties of the soils retrieved from the site to aid in verifying soil classification.

Moisture Content: The natural water content was determined (ASTM D2216) on 135 samples of the materials recovered from the borings. These water contents are recorded on the boring logs at the appropriate sample depths.

Dry Densities: In place dry density determinations (ASTM D2937) were performed on 97 samples to measure the unit weight of the subsurface soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Washed Sieve Analyses: The percent soil fraction passing the No. 200 sieve (ASTM D1140) was determined on 11 samples of the subsurface soils to aid in the classification of these soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Grain Size Analyses: The particle size distribution (ASTM D422) was determined on four samples of the near-surface soils to aid in the classification of these soils and determining the percent silt and clay. Results of these tests are shown in the table below.

Table B-1: Summary of Grain Size Analyses

Sieve Size	EB-4 1.5'	EB-7 2 – 7'	EB-9 1.5 – 6.5'	EB-12 11.5'
	% Passing	% Passing	% Passing	% Passing
¾-inch	100	100	100	100
No. 4	100	100	100	100
No. 10	100	99.7	99.6	100
No. 16	100	99.5	99.4	99.9
No. 30	99.8	98.5	98.3	99.4
No. 50	86.7	88.3	90.0	95.4
No. 100	18.6	42.0	44.0	54.1
No. 200	10.1	29.4	30.8	32.7
Silt	5%	11%	14%	21%
Clay	5%	18%	17%	12%

Plasticity Index: Seven Plasticity Index determinations (ASTM D4318) were performed on samples of the subsurface soils to measure the range of water contents over which this material exhibits plasticity. The Plasticity Index was used to classify the soil in accordance with the Unified Soil Classification System and to evaluate the soil expansion potential. Results of these tests are shown on the boring logs at the appropriate sample depths.

Compaction: Five compaction tests (ASTM D 1557-00 Method B) were performed on sand samples to assist in evaluating the maximum dry unit weight and optimum moisture content of the soils. Results of the compaction tests are included as part of this appendix.

California Bearing Ratio: California Bearing Ratio Tests (CBR) (ASTM D1883) were performed on two samples of the subsurface soils ranging from 1½ to 7 feet below grade to evaluate the mechanical strength of this soil. Results of the CBR tests are shown below and graphically in this appendix.

Table B-2: Results of California Bearing Ratio Test Boring EB-7

Sample	Depth of Soil Sample	Classification	CBR at Required In-Situ Field Density (%)			
EB-7	2 – 7 feet	Sand	Rel. Comp. (%)	91	95	98.3
			@ 0.1 in.	18.2	29.1	41.5
			@ 0.2 in.	20.9	32.8	54.7

Table B-3: Results of California Bearing Ratio Test Boring EB-9

Sample	Depth of Soil Sample	Classification	CBR at Required In-Situ Field Density (%)			
EB-7	1½ – 6½ feet	Sand	Rel. Comp. (%)	90.7	95	99.6
			@ 0.1 in.	16.6	32.4	46.4
			@ 0.2 in.	17.9	38.1	60.6

Plasticity Index (ASTM D4318) Testing Summary

CTL Job No.:	640-1065	**Boring:**	EB-7	**Date:**	12/20/2016
Client:	Cornerstone Earth Group	**Sample:**	Bulk	**Tested :**	PJ
Project Name:	MRY New Terminal and Apron Imp	**Depth (ft.):**	2'-7'	**Checked:**	DC
Project No:	234-2-7				
Visual Description:	Brown Silty SAND (SM)				

Maximum Dry Density (pcf):	125.2	Optimum Moisture Content (%):	10.0	Rel. Comp. For CBR Evaluation (% of max):	98.3
Maximum Density & Optimum Moisture Obtained By:	ASTM D1557	Sample Condition:	Soaked	Surcharge Weight (kg):	4.54

Percent Retained on 3/4in. Sieve:	0.0	Remarks:	The CBR at 0.2 inches was greater than the CBR at 0.1 inches. The confirmatory test was not run. Due to the material characteristics, the 9 blows per layer point exceeded the minimum target relative compaction of 90%, the CBR was reported at 91.0% relative compaction. Did not exceed the maximum target relative compaction of 100% at 63 blows per layer, CBR reported at 98.3% relative compaction.

Sample Information

CTL Job No.:	640-1065	**Boring:**	EB-9	**Date:**	12/20/2016
Client:	Cornerstone Earth Group	**Sample:**	Bulk	**Tested :**	PJ
Project Name:	MRY New Terminal and Apron Imp	**Depth (ft.):**	1.5'-6.5'	**Checked:**	DC
Project No:	234-2-7				

Visual Description: Light Brown Silty SAND (SM)

Maximum Dry Density (pcf):	124.7	Optimum Moisture Content (%):	9.7	Rel. Comp. For CBR Evaluation (% of max):	99.6
Maximum Density & Optimum Moisture Obtained By:	ASTM D1557	Sample Condition:	Soaked	Surcharge Weight (kg):	4.54
Percent Retained on 3/4in. Sieve:	0.0	Remarks:	The CBR at 0.2 inches was greater than the CBR at 0.1 inches. The confirmatory test was not run. Due to the material characteristics, the 9 blows per layer point exceeded the minimum target relative compaction of 90%, the CBR was reported at 90.7% relative compaction. Did not exceed the maximum target relative compaction of 100% at 63 blows per layer, CBR reported at 99.7% relative compaction.

TECHNICAL DRAINAGE MEMORANDUM

To:	Coffman Associates, Inc.
From:	Sam McWhorter, P.E. Alexander Lin, E.I.T. Kimley-Horn and Associates, Inc. 401 B Street, Suite 600 San Diego, California 92101
Date:	May 2, 2018
Subject:	Monterey Regional Airport – Proposed Safety Enhancement Project Technical Memorandum, Drainage Study

Summary

This technical drainage memo has been prepared to analyze the existing drainage conditions and provide recommendations for the project area storm drain system at the Monterey Regional Airport. The project area consists of 2 locations: South side for future terminal apron construction and Taxiway A relocation, and North Side for future hangar buildings.

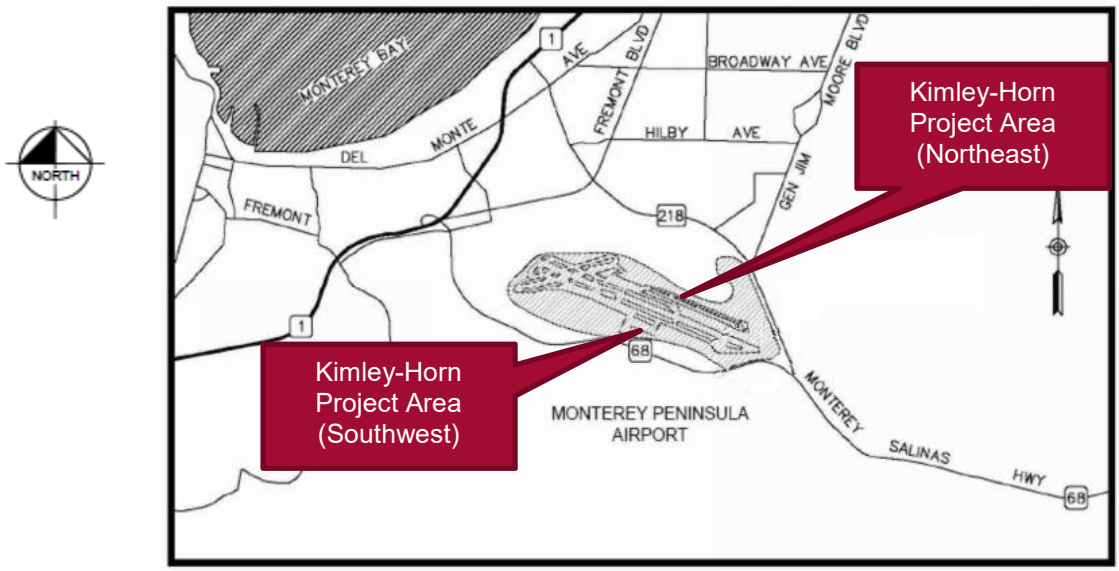
The project area hydrology/storm drain hydraulics were analyzed for the 5-year storm event in accordance with the *Federal Aviation Administration's Advisory Circular 150/5320-5C Surface Drainage Design Manual.* See **Figure 1** and **Figure 2** for the proposed modifications to the existing storm drain systems.

Overview

Project Setting

The airport is a general aviation and commercial aviation facility located north of Monterey Salinas Highway (Highway 68) and just east of Monterey Bay (Figure 1). The airport is owned and operated by the municipalities that make up the Monterey Regional Airport District and consists of two (2) runways, two (2) parallel taxiways plus other associated connector taxiways. The existing drainage system at the Airport consists of pipe culverts under taxiways and runways.

Monterey Regional Airport



Vicinity Map

Topographic information for the project was obtained from site specific survey. The airport generally slopes from south to north draining across the airport runway and taxiways with culverts. The project is located within the Canyon Del Rey-Frontal Monterey Bay Watershed. The airport is located in the "Central Coast" area of Southern California. The average high temperature for Monterey is 64 Degrees Fahrenheit with an average annual rainfall of 21.16 inches (www.usclimatedata.com). Most of the rainfall in the watershed occurs from November through March.

Hydrology Analysis

Storm drains on the airport have been sized for the 5yr-24 hr storm event. See **Table 1** and **Table 2** for Hydrology Calculations.

Hydrology Calculations has been prepared in accordance with the *Federal Aviation Administration's Advisory Circular 150/5320-5C Surface Drainage Design Manual.*

The rainfall intensity is required to calculate the sheet flow travel time. The rainfall intensity (i), for the 5yr-24hr storm was found by using an Intensity-Duration Frequency (IDF) curve developed by the *Caltrans IDF Rainfall Curve Program, v. 2.11 (*2004 Data). The IDF curve equation shown below is relative to the 5 yr-24hr storm event, with the constants relative to the Del Monte Rain Gauge Stations, in close proximity to the project site.

$$I_5 = 0.525t_c^{-0.527}$$

Where: i_{25} = Rainfall Intensity [in/hr] (5yr-24hr Storm)
t_c = Rainfall Duration [hrs]

The results of the Hydrologic Analysis are located in **Appendix A**. The Caltrans IDF curve data used in the hydrology calculations are located in **Appendix B**. Excerpts from the FAA UFC are located in **Appendix C**.

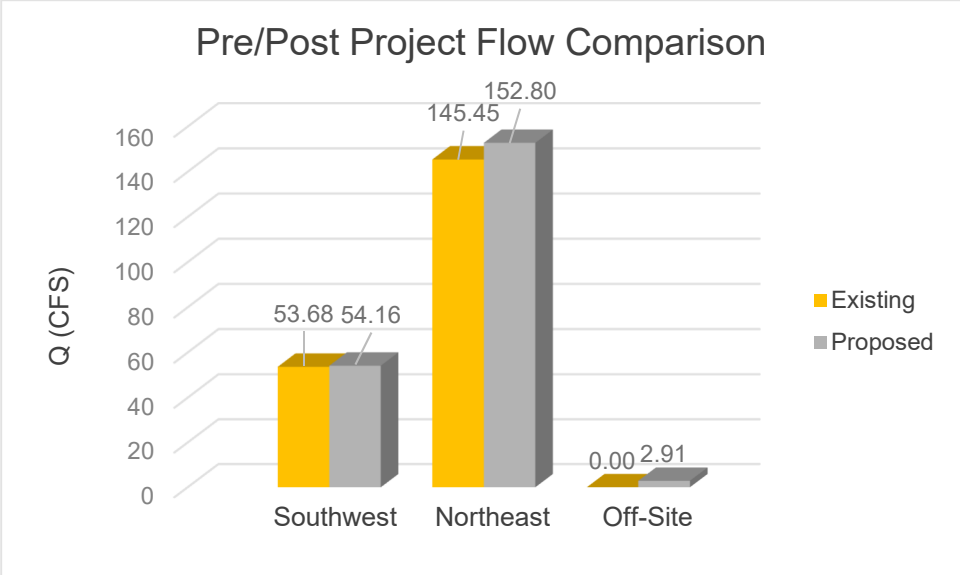
Chart 1 – Pre and Post Project Flow Comparison



Hydraulic Analysis

Storm drains on the airport were analyzed using the computer program StormCAD. Existing storm drain information including pipe sizes and flowline information was used to prepare a StormCAD hydraulic model. The model was used to verify capacity of the existing storm drain system for the project areas and determine locations where pipe sizes were deficient and did not meet the design storm capacity. These segments of undersized pipe were then upsized in the model to determine the extents of pipe upgrades required to serve the proposed project. Upsized storm drains are depicted on Figures 1 and 2 along with proposed pipe sizes. The StormCAD modeling results are located in **Appendix D**.

Conclusion

Based on the hydraulic analysis, the airside improvements will create a slight increase in the flow to the southwest point of confluence (POC). However, this increase is slight enough to be considered negligible. New storm drains would have to be installed, as shown in **Figure 1,** and some existing infrastructure would have to be up-sized to handle the re-configuration. Flow to the northeast POC has also increased. The existing detention basin was designed to accommodate future development; thus, no additional improvement will be needed to mitigate the increased flow. New storm drains will be installed to convey runoffs from the new hangar buildings as shown in **Figure 2**. Due to the the existing topography, the northside access rod to the Northside GA will create run-off that drains off-site towards Del Rey Gardens Drive. The connection to Del Rey Gardens is being performed by others, further evaluation will be required for a drainage solution at this POC. The proposed post project runoff generated from this portion of the Northside Access Road can be found in **Chart 1** labeled as Off-Site.

APPENDIX C

FAA UFC EXCERPTS

Figure 2-3. Approximate Geographic Areas for SCS Rainfall Distributions

Although the SCS distributions shown do not agree exactly with IDF curves for all locations in the region for which they are intended, the differences are within the accuracy limits of the rainfall depths from the Weather Bureau's rainfall frequency atlases.

2-3.2 Determination of Peak Flow Rates. Peak flows are generally adequate for design and analysis of conveyance systems such as storm drains or open channels; however, if the design or analysis must include flood routing (e.g., storage basins or complex conveyance networks), a flood hydrograph is required. This section discusses three methods, the Rational Method, the SCS TR-55 method, and the USGS regression equations, that are used to derive peak flows for both gaged and ungaged sites. Each method can be used to develop a peak discharge. The drainage area of the project usually dictates which of these methods should be used. The Rational Method is the most commonly used method, but due to its assumptions, it is limited to drainage areas smaller than 200 acres. For drainage areas up to 2000 acres, the SCS TR-55 method is commonly used. Due to the way in which the regression equations were developed, they are usually not appropriate for very small areas, but each set of equations has its own limitations and those should be understood before the equations are applied. The regression equations are often used to compute the discharges for larger areas such as those necessary for culvert design.

2-3.2.1 **Rational Method.** One of the most commonly used equations for the calculation of peak flow from small areas is the Rational Formula, given as Equation 2-1:

$$Q = CIA \quad (2\text{-}1)$$

where:

Q = flow, ft^3/s

C = dimensionless runoff coefficient representing the characteristics of the watershed

I = rainfall intensity, in/hr

A = drainage area, hectares, acres

2-3.2.1.1 **Assumptions**. Assumptions inherent in the Rational Formula are that:

- Peak flow occurs when the entire watershed is contributing to the flow.
- Rainfall intensity is the same over the entire drainage area.
- Rainfall intensity is uniform over a time duration equal to the time of concentration (t_c). The time of concentration is the time required for water to travel from the hydraulically most remote point of the basin to the point of interest.
- The frequency of the computed peak flow is the same as that of the rainfall intensity, i.e., the 10-year rainfall intensity is assumed to produce the 10-year peak flow.
- The coefficient of runoff is the same for all storms of all recurrence probabilities.

2-3.2.1.2 **Limitations**. Because of the inherent assumptions, the Rational Formula should be applied only to drainage areas smaller than 200 acres.

2-3.2.2 **Runoff Coefficient**

2-3.2.2.1 The runoff coefficient, *C*, in Equation 2-1 is a function of the ground cover and a host of other hydrologic abstractions. It relates the estimated peak discharge to a theoretical maximum of 100 percent runoff. Typical values for *C* are given in Table 2-1. If the basin contains varying amounts of different land cover or other abstractions, a composite coefficient can be calculated through area weighing using Equation 2-2:

$$\text{weighted } C = \frac{\sum (C_x A_x)}{A_{total}} \quad (2\text{-}2)$$

where:

x = subscript designating values for incremental areas with consistent land cover

Table 2-1. Runoff Coefficients for Rational Formula

Type of Drainage Area	Runoff Coefficient, *C**
Business:	
Downtown areas	0.70 - 0.95
Neighborhood areas	0.50 - 0.70
Residential:	
Single-family areas	0.30 - 0.50
Multi-units, detached	0.40 - 0.60
Multi-units, attached	0.60 - 0.75
Suburban	0.25 - 0.40
Apartment dwelling areas	0.50 - 0.70
Industrial:	
Light areas	0.50 - 0.80
Heavy areas	0.60 - 0.90
Parks, cemeteries	0.10 - 0.25
Playgrounds	0.20 - 0.40
Railroad yard areas	0.20 - 0.40
Unimproved areas	0.10 - 0.30
Lawns:	
Sandy soil, flat, 2 percent	0.05 - 0.10
Sandy soil, average, 2 to 7 percent	0.10 - 0.15
Sandy soil, steep, 7 percent	0.15 - 0.20
Heavy soil, flat, 2 percent	0.13 - 0.17
Heavy soil, average, 2 to 7 percent	0.18 - 0.22
Heavy soil, steep, 7 percent	0.25 - 0.35
Streets:	
Asphaltic	0.70 - 0.95
Concrete	0.80 - 0.95
Brick	0.70 - 0.85
Drives and walks	0.75 - 0.85
Roofs	0.75 - 0.95
*Higher values are usually appropriate for steeply sloped areas and longer return periods because infiltration and other losses have a proportionally smaller effect on runoff in these cases.	

2-3.2.2.2 Example 2-1 illustrates the calculation of the runoff coefficient, *C*, using area weighing.

Example 2-1

Given: These existing and proposed land uses:

Existing conditions (unimproved):

Land Use	**Area, acres**	**Runoff Coefficient, *C***
Unimproved Grass	22.1	0.25
Grass	21.2	0.22
Total =	43.3	

Proposed conditions (improved):

Land Use	**Area, acres**	**Runoff Coefficient, *C***
Paved	5.4	0.90
Lawn	1.6	0.15
Unimproved Grass	18.6	0.25
Grass	17.7	0.22
Total =	43.3	

Find: Weighted runoff coefficient, *C*, for the existing and proposed conditions.

Solution:

Step 1. Determine weighted *C* for existing (unimproved) conditions using Equation 2-2.

$$\text{weighted } C = \frac{\sum (C_x A_x)}{A}$$

$$\text{weighted } C = \frac{[(22.1)(0.25)+(21.2)(0.22)]}{(43.3)}$$

$$\text{weighted } C = 0.235$$

Step 2. Determine weighted *C* for proposed (improved) conditions using Equation 2-2.

$$\text{weighted } C = \frac{[(5.4)(0.90)+(1.6)(0.15)+(18.6)(0.25)+(17.7)(0.22)]}{(43.3)}$$

$$\text{weighted } C = 0.315$$

2-3.2.3 **Rainfall Intensity.** Rainfall intensity, duration, and frequency curves are necessary to use the Rational Method. Regional IDF curves are available in most state

and local highway agency manuals and are also available from NOAA. If the IDF curves are not available, they should be developed.

2-3.2.4 **Time of Concentration.** A number of methods can be used to estimate time of concentration, t_c, some of which are intended to calculate the flow velocity within individual segments of the flow path (e.g., shallow concentrated flow, open channel flow, etc.). The time of concentration can be calculated as the sum of the travel times within the various consecutive flow segments. For additional discussion on establishing the time of concentration for inlets and drainage systems, see Chapters 3 and 6 of this manual.

2-3.2.4.1 **Sheet Flow Travel Time**. Sheet flow is the shallow mass of runoff on a planar surface with a uniform depth across the sloping surface. This usually occurs at the headwater of streams over relatively short distances, rarely more than about 400 feet (ft), and possibly less than 80 feet. Sheet flow is commonly estimated with a version of the kinematic wave equation, a derivative of Manning's equation, shown as Equation 2-3:

$$T_{ti} = \frac{K_c}{I^{0.4}}\left(\frac{nL}{\sqrt{S}}\right)^{0.6} \quad (2\text{-}3)$$

where:

T_{ti} = sheet flow travel time, minutes (min)

n = roughness coefficient (see Table 2-2)

L = flow length, ft

I = rainfall intensity, in/hr

S = surface slope, feet per feet (ft/ft)

K_c = empirical coefficient equal to 0.933

Table 2-2. Manning's Roughness Coefficient (*n*) for Overland Sheet Flow

Surface Description	*n*
Smooth asphalt	0.011
Smooth concrete	0.012
Ordinary concrete lining	0.013
Good wood	0.014
Brick with cement mortar	0.014
Vitrified clay	0.015
Cast iron	0.015

Surface Description	*n*
Corrugated metal pipe	0.024
Cement rubble surface	0.024
Fallow (no residue)	0.05
Cultivated soils	
Residue cover < 20 percent	0.06
Residue cover > 20 percent	0.17
Range (natural)	0.13
Grass	
Short grass prairie	0.15
Dense grasses	0.24
Bermuda grass	0.41
Woods*	
Light underbrush	0.40
Dense underbrush	0.80
*When selecting *n*, consider cover to a height of about 1.2 inches. This is only part of the plant cover that will obstruct sheet flow.	

Since the rainfall intensity value, *I*, depends on t_{ti} and t_{ti} is not initially known, the computation of t_{ti} is an iterative process. An initial estimate of t_{ti} is assumed and used to obtain *I* from the IDF curve for the locality. The t_{ti} is then computed from Equation 2-3 and used to check the initial value of t_{ti}. If they are not the same, the process is repeated until two successive t_{ti} estimates are the same.

2-3.2.4.2 **Shallow Concentrated Flow Velocity**. After short distances of at most 300 ft, sheet flow tends to concentrate in rills and then gullies of increasing proportions. Such flow is usually referred to as shallow concentrated flow. The velocity of such flow can be estimated using a relationship between velocity and slope as shown in Equation 2-4:

$$V = (3.28)kS_p^{0.5} \quad (2\text{-}4)$$

where:

V = velocity, ft/s

k = intercept coefficient (see Table 2-3)

S_p = slope, percent

Table 2-3. Intercept Coefficients for Velocity vs. Slope Relationship of Equation 2-4

Land Cover/Flow Regime	*k*
Forest with heavy ground litter; hay meadow (overland flow)	0.076
Trash fallow or minimum tillage cultivation; contour or strip cropped; woodland (overland flow)	0.152
Short grass pasture (overland flow)	0.213
Cultivated straight row (overland flow)	0.274
Nearly bare and untilled (overland flow); alluvial fans in western mountain regions	0.305
Grassed waterway (shallow concentrated flow)	0.457
Unpaved (shallow concentrated flow)	0.491
Paved area (shallow concentrated flow); small upland gullies	0.619

2-3.2.4.3 **Open Channel and Pipe Flow Velocity**. Flow in gullies empties into channels or pipes. Open channels are assumed to begin where either the blue stream line shows on USGS quadrangle sheets or the channel is visible on aerial photographs. Cross-section geometry and roughness should be obtained for all channel reaches in the watershed. Manning's equation can be used to estimate average flow velocities in pipes and open channels as follows:

$$V = \frac{1.49}{n} R^{2/3} S^{1/2} \qquad (2\text{-}5)$$

where:

n = roughness coefficient (see Table 2-4)

V = velocity, ft/s

R = hydraulic radius (defined as the flow area divided by the wetted perimeter), ft

S = slope, ft/ft

Table 2-4. Values of Manning's Coefficient (*n*) for Channels and Pipes

Conduit Material	Manning's *n**
Closed Conduits	
Brick	0.013 - 0.017
Cast iron pipe	
Cement-lined and seal coated	0.011 - 0.015

Conduit Material	Manning's *n**
Concrete (monolithic)	0.012 - 0.014
Concrete pipe	0.011 - 0.015
Corrugated-metal pipe – 0.5 inch by 2.5 inch corrugations	
Plain	0.022 - 0.026
Paved invert	0.018 - 0.022
Spun asphalt lines	0.011 - 0.015
Plastic pipe (smooth)	0.011 - 0.015
Vitrified clay	
Pipes	0.011 - 0.015
Liner plates	0.013 - 0.017
Open Channels	
Lined channels	
Asphalt	0.013 - 0.017
Brick	0.012 - 0.018
Concrete	0.011 - 0.020
Rubble or riprap	0.020 - 0.035
Vegetal	0.030 - 0.400
Excavated or dredged	
Earth, straight and uniform	0.020 - 0.030
Earth, winding, fairly uniform	0.025 - 0.040
Rock	0.030 - 0.045
Unmaintained	0.050 - 0.140
Natural channels (minor streams, top width at flood stage < 100 feet)	
Fairly regular section	0.030 - 0.070
Irregular section with pools	0.040 - 0.100
*Lower values are usually for well-constructed and maintained (smoother) pipes and channels.	

For a circular pipe flowing full, the hydraulic radius is one-fourth of the diameter. For a wide rectangular channel ($W > 10\ d$), the hydraulic radius is approximately equal to the depth. The travel time is then calculated as follows:

$$T_{ti} = \frac{L}{60V} \qquad (2\text{-}6)$$

where:

T_{ti} = travel time for segment i, min

L = flow length for segment i, ft

V = velocity for segment i, ft/s

Example 2-2

Given: These flow path characteristics:

Flow Segment	Length (ft)	Slope (ft/ft)	Segment Description
1 (sheet flow)	223	0.005	Bermuda grass
2 (shallow conduit)	259	0.006	Grassed waterway
3 (flow in conduit)	479	0.008	15-in concrete pipe

Find: Time of concentration, t_c, for the area.

Solution:

Step 1. Calculate time of concentration for each segment.

Segment 1

Obtain Manning's n roughness coefficient from Table 2-2: $n = 0.41$

Determine the sheet flow travel time using Equation 2-3:

$$T_{ti} = \frac{K_c}{I^{0.4}}\left(\frac{nL}{\sqrt{S}}\right)^{0.6}$$

Since the rainfall intensity value, I, is being sought and is also in the equation, an iterative approach must be used. From experience, estimate a time of concentration and read a rainfall intensity from the appropriate IDF curve. In this example, try a time of concentration of 30 min and read from the IDF curve in Figure 2-1 an intensity of 3.4 in/hr. Now use Equation 2-3 to see how good the 30-min estimate was.

First, solve the equation in terms of I.

$$T_{ti1} = \left[\frac{0.933}{(I)^{0.4}}\right]\left[\frac{(0.41)(223)}{(0.005)^{0.5}}\right]^{0.6} = \frac{(68.68)}{I^{0.4}}$$

Inserting 3.4 in/hr for I, the result is 42.1 min. Since 42.1 is greater than the assumed 30 min, try the intensity for 42 min from Figure 2-1, which is 2.8 in/hr.

Using 2.8 in/hr, the result is 45.4 min. Repeat the process with 2.7 in/hr for 45 min and the result is a time of 46.2. This value is close to the 45.2 min.

Use 46 min for segment 1.

Segment 2

Obtain the intercept coefficient, *k*, from Table 2-3: *k* = 0.457 and K_c = 3.281

Determine the concentrated flow velocity from Equation 2-4:

$$V = 3.28kS_p^{0.5} = (3.28)(0.457)(0.6)^{0.5} = 116 \text{ ft/s}$$

Determine the travel time from Equation 2-6:

$$T_{ti2} = \frac{L}{(60V)} = \frac{259}{[(60)(1.16)]} = 3.7 \text{ min}$$

Segment 3

Obtain Manning's *n* roughness coefficient from Table 2-4: *n* = 0.011

Determine the pipe flow velocity from Equation 2-5 (assuming full flow)

V = (1.49/0.011)(1.25/4)0.67 (0.008)0.5 = 5.58 ft/s

Determine the travel time from Equation 2-6:

$$T_{ti3} = \frac{L}{(60V)} = \frac{479}{[(60)(5.58)]} = 1.4 \text{ min}$$

Step 2. Determine the total travel time by summing the individual travel times:

$t_c = T_{ti1} + T_{ti2} + T_{ti3}$ = 46.0 + 3.7 + 1.4 = 51.1 min Use 51 min

Example 2-3

Given: Land use conditions from Example 2-1 and the following times of concentration:

Condition	**Time of concentration t_c (min)**	**Weighted *C* (from Example 2-1)**
Existing condition (unimproved)	88	0.235
Proposed condition (improved)	66	0.315

Area = 43.36 acres

Find: The 10-year peak flow using the Rational Formula and the IDF curve shown in Figure 2-1.

Solution:

Step 1. Determine the rainfall intensity, *I*, from the 10-yr IDF curve for each time of concentration.

Existing condition (unimproved) 1.9 in/hr

Proposed condition (improved) 2.3 in/hr

Step 2. Determine peak flow rate, *Q*.

Existing condition (unimproved):

$Q = CIA$

$= (0.235)(1.9)(43.3)$

$= 19.3\ ft^3/s$

Proposed condition (improved):

$Q = CIA$

$= (0.315)(2.3)(43.3)$

$= 31.4\ ft^3/s$

2-3.3 USGS Regression Equations. Regression equations are commonly used for estimating peak flows at ungaged sites or sites with limited data. The USGS has developed and compiled regional regression equations that are included in a computer program called the National Flood Frequency program (NFF). NFF allows quick and easy estimation of peak flows throughout the United States. All the USGS regression equations were developed using dependent variables in English units. Local equations may be available to provide better correspondence to local hydrology than the regional equations found in NFF. For more information on NFF, refer to paragraph 12-7.7.

2-3.3.1 **Rural Equations.** The rural equations are based on watershed and climatic characteristics within specific regions of each state that can be obtained from topographic maps, rainfall reports, and atlases. These regression equations are generally of the following form:

$$RQ_T = aA^bB^cC^d \qquad (2\text{-}7)$$

TECHNICAL MEMORANDUM
ON SOILS
AT THE MONTEREY REGIONAL AIRPORT

Prepared by
Sherman W. Low, PE
Neill Engineers Corp.
May 19, 2017

This technical memorandum on the soil conditions at the Monterey Regional Airport is based on historical information and personal experience while working on past projects there for over 40 years.

Generally the soil conditions at the Monterey Regional Airport comprises mostly of sands varying from silty to clayey sands.

The westerly portion of the airfield consist mostly of good quality sandy subgrade. When the airfield was originally constructed, the westerly portion of the airport was mostly constructed from fill material (probably imported fill) and the easterly portion was mostly in cut. The fill is evidenced by the higher airfield elevation than the surrounding golf course area and the adjacent Navy property to the north. The excavated cut area for the easterly portion of the airfield is evidenced by the cut slope along the south side of Taxiway A the cut slope north of the General Utility Runway and Taxiway C. The easterly portion of the airfield consists of varying degrees of silty to clayey sands, which are poorer subgrade materials. Correspondingly, the runway structural pavement section is thicker at the east end of the runway than for the west end.

In general, the predominantly sandy soils existing on the airport provides a good subgrade foundation for the airfield pavements. For the most part, the airfield pavements are in sound condition due to the underlying sandy-type soils and the airport's diligence in keeping a good pavement maintenance program.

However; the southeasterly area of the airport contains some of the poorer soils. The soils encountered in this area consists of varying degrees of clayey material with sub-surface water issues. Sub-surface water was encountered during the initial construction of the ARFF/Safety Building in 1977. The aircraft parking apron pavement located east of the large FBO maintenance hangar and the pavement area east of the southeast T-hangars had to be reconstructed due to prior pavement failures. The pavement failures were caused by the poor quality clayey material and wet soil conditions. The reconstruction of the pavements in these areas required installation of sub-surface drainage facilities such as sub-drains, curtain walls,

drain rock stabilization, pavement stabilization fabric and thicker structural pavement sections to mitigate the presence of clayey sand soils. Groundwater was encountered in these areas during trench excavation. I would expect that similar conditions will be encountered for the future construction projects anticipated for this area of the airport.

Mass grading for the general utility runway, taxiways and aircraft parking apron site was performed in 1986. The excavation material from the mass grading was used to construct the fill area and fill slopes for the expansion of the parking apron area to the west and also for the earth berm located on the northside adjacent to the Del Rey Oaks residential properties. These soils generally consisted of native silty-sands. The fill area for the future expansion of the parking apron area to the west was placed and compacted as engineered fill.

Excavated soil from the grading of the northside detention pond was also used to construct the earth berm located on the northside adjacent to the Del Rey Oaks properties. During the excavation of the detention pond, significant groundwater was encounter near the pond bottom. The bottom of the pond was very unstable due to high groundwater. The soil at the detention pond is classified as a sandy clay.

The southwesterly area at the Del Monte Aviation and Monterey Jet Center FBO's leasehold sites generally consists of silty sands. During the roadway construction for Sky Park Drive, groundwater was encountered along the cut slopes on the southside of the roadway. A sub-drain had to be installed along the southwesterly portion of the cut slope west of Sky Park Way. The northerly portion of Sky Park Drive was constructed mostly with fill material. This northerly portion of Sky Park Drive was previously utilized as a dumping/disposal site. As a result, isolated settlement areas in the roadway had occurred and is still occurring due to the underlying material shifting or organic material decomposing or degradation underneath. Fills for the roadway construction and adjacent fill areas is probably in the neighborhood of 15-20 foot depths.

The pavement section for Sky Park Drive is not very thick (3" AC, over 4" AB), but has held up well for over 20 years. This roadway has been subjected to heavy use by construction vehicles and trucks.

The soils for the proposed future Del Rey Oaks access road to the undeveloped northside area of the airport generally consist of sands with varying degrees of silt and clay binder and cementation. Based on the geotechnical investigation report, the proposed roadway alignment is compatible with the site provided geotechnical recommendations are incorporated in the design and construction of the project.

While the sandy-type soil provides a stable foundation for structural support, it is a highly erodible material and will require some type of treatment if left unprotected and subject to erosion. Some localized areas of erosion had occurred and been mitigated over the years.

This technical memorandum is intended to provide a general overview of the soil conditions at the Monterey Regional Airport. There are areas of the airport that have not been developed and therefore, the soil conditions in these areas are not known.

As the Airport continues to expand, additional and more detailed geotechnical investigation and analysis will need to be prepared on a specific project basis. Current and updated design parameters and requirements will need to be met and incorporated into the design and construction of the anticipated future projects.

TECHNICAL MEMORANDUM
FOR DRAINAGE
AT THE MONTEREY REGIONAL AIRPORT

Prepared by
Sherman W. Low, PE
Neill Engineers Corp.
May 19, 2017

The storm runoff from the Monterey Regional Airport is mostly collected by a system of catch basins and storm drain pipes. Basically, there are three large drainage areas that discharge storm runoff from the airport. These drainage areas discharge into the drainage facilities of adjacent municipalities at three different locations of the airport.

The airport is situated at a higher elevation of the surrounding terrain and is not subject to flooding from natural watershed areas. As identified by FEMA maps, the airport is not located in a flood plain.

The airfield drainage facilities are designed for a 5-yr return period storm per the FAA Advisory Circular. The rainfall intensity is based on Monterey County Standard Details.

The three main drainage areas are:

A. The southwesterly portion of the airport
B. The northeasterly portion of the airport
C. The northwesterly portion of the airport

Smaller drainage areas such as the southwesterly portion of the airport drains toward State Highway 68 via surface flows; the easterly end portion of the airport drains toward State Highway 68 and Del Rey Oaks.

A. Southwesterly portion of the airport

This drainage basin comprises of approximately 116 acres and consists of generally the area southerly the main Runway 10R-28L centerline between Taxiway E and Taxiway L including this corresponding segment of Taxiway A, the southside aircraft parking ramp areas, the airport's terminal building area and parking lots, FBO sites, and all the areas to the south and southwest.

Storm water runoff is collected by a system of catch basins and storm drain pipes. The storm drain trunkline for this drainage area runs downhill along Taxiway A beginning at connector Taxiway L through the infield safety areas, then across and along Taxiway A, then turning in the southwesterly direction through the Del Monte Aviation and Monterey Jet Center FBO sites, then crossing Sky Park Drive through the Monterey Pines (Navy) Golf Course and ultimately

connecting into the City of Monterey storm drain system discharging along State Highway 68 and ultimately ending up in Del Monte Lake located at the Navy Postgraduate School.

In 2009, storm drainage improvements were constructed to increase the capacity of the storm drain trunkline in the apron area at the Del Monte Aviation FBO site. There were pipe segments in the trunkline that could not accommodate the design runoff for a 5-yr return storm. Additional pipes were installed that greatly reduced the flooding problems encountered for the airfield site and Del Monte Aviation parking apron areas.

However; it must be pointed out that a drainage problem still exists at the southwest corner bend at Sky Park Drive adjacent to the Monarch Pines Golf Course. At this location, 3-36" storm drain pipes connects into a single 36" discharge pipe running through the Golf Course. This results in occasional short-term flooding of the roadway during heavy storms. The situation needs to be addressed and remedied at a future time, and will require collaboration with the Navy Golf Course and City of Monterey.

Any new development that will cause an increase in pre-development runoff is required to construct detention and/or retention facilities. Detention facilities were constructed for the development of the Monterey Jet Center FBO site.

B. Northeasterly portion of the airport

This drainage basin is initially comprised of approximately over 245 acres and consists generally of all of the airfield area north of the centerline of main Runway 10R-28L between the east end of the runway and connector Taxiway G, including this segment of Taxiway B, the General Utility Runway 10L-28R, taxiways, and aircraft parking areas, and the entire undeveloped northside area. The airfield area including Taxiway D for the Old Northside drainage basin and the NSSI hangars site located at the northeasterly end of Taxilane E were added to this drainage basin at a later date, after the construction of the detention pond. It added approximately 17 acres to this drainage basin.

This area is collected by a series of catch basins and storm drain pipes that discharges into a large detention pond located at the northside of the airport. This pond was constructed in 1986 as part of the mass grading work for the General Utility Runway 10L-28R, taxiways, and parking apron project. The detention pond drains into a natural drainage channel that runs along Rosita Road in Del Rey Oaks, and into Canyon Del Rey Creek, ultimately ending up into Laguna Grande Lake in Seaside.

The detention pond was designed to accommodate future development. It is designed to allow the 10 year existing storm to pass, but detain the difference between the projected 100 year future developed runoff and the existing 10 year runoff. The existing 10 year runoff discharges through a 30" storm drain outlet pipe through the pond embankment. The pond was designed to provide approximately 409,000 cubic feet of available pond storage.

Although the detention pond was designed to accommodate future development, future projects should be reviewed for drainage impacts to the pond storage capacity on a project by project basis.

C. Northwesterly portion of the airport

This westerly portion of this drainage basin comprises of approximately 30 acres and consists generally of the northwesterly portion of the airfield area from Taxiway E to the west, including the westerly portion of Taxiway B and northerly infield safety area between connector Taxiways E & G, and the northerly portion of the Monterey Jet Center FBO site. The airport's storm drain system connects to storm drain pipes through the adjacent Navy property and then into the City of Monterey's storm drain facilities along Airport Road and Euclid Avenue at two separate locations. These two locations discharges into the same City storm drain line that ultimately ends up in Laguna Grande Lake in Seaside.

The westerly end of the airfield drains toward the adjacent Navy Golf Course and the adjacent Navy property to the north. This runoff is collected by a system of catch basins and storm pipe that connects to the Navy storm drain facilities before entering the City of Monterey facilities on Airport Road. Previously, there had been some property transfer between the Airport and the Navy. This may be why the Airport's storm drains are connected to the portions of the Navy's storm drain system.

This northerly portion of this drainage basin includes the Old Northside area. The Old Northside drainage area contains approximately 26 acres and drains to the northeast corner of the Airport property. The runoff discharges from the Airport property into an old 18" concrete storm drain line that runs through private property. This 18" line runs underneath the house on the residential property to connect to the City of Monterey's storm drain system along Euclid Avenue. In order to alleviate a potential for flood damage to the lower neighboring properties, the Airport installed an oversized 30" storm drain pipe under a large oversized concrete open drainage channel in 1991 to provide back-up and storage on the airport property in event the 18" storm drain discharge pipe exceeds its capacity during a heavy rainfall event.

The existing 18" concrete storm drain pipe was also mortar-lined for structural integrity and to protect against exfiltration and leakage.

In 1994, the existing storm drain system for the airfield portion of the Old Northside was re-routed and re-directed to discharge into the detention pond serving the northeasterly drainage basin. This eliminated approximately 17 acres from the Old Northside drainage area and thereby reduced the amount of storm runoff from draining into the 18" storm drain discharge pipe running under the house. It significantly reduces the risk of flooding the downstream homes adjacent to Airport property.

Overall the Airport's drainage system have been functioning properly. Historically, no major flooding has occurred. As previously noted, the airfield facilities have been designed for a 5-yr return storm based on the FAA Advisory Circular requirements. While this may be adequate for the airfield facilities, the new terminal building and supporting roadways and public use parking lots are recommended to be designed to a higher standard. A minimum of a 10-yr return storm is recommended for roadways, and a minimum of a 25-yr storm event should be used for terminal area facilities, depending on the impact from potential flooding.

Any increase in runoff generated from new development/construction should be mitigated by use of retention and/or detention facilities or application of L.I.D. (low impact development) methods.)

1 INTRODUCTION

1.1 Report Purpose and Scope

The purpose of this report is to estimate and evaluate the potential net change in sequestered carbon associated with implementation of the proposed Monterey Regional Airport's (Airport) Proposed Master Plan and Associated Development Projects. This report estimates the potential net change in sequestered carbon associated with implementation of the Proposed Project and Alternative 1 (the environmentally superior alternative).

This carbon sequestration analysis estimates carbon dioxide (CO_2) emissions associated with the one-time loss of sequestered carbon resulting from proposed removal of trees and vegetation. This analysis also estimates a one-time carbon-stock change associated with the proposed planting of trees that will sequester new CO_2.

This introductory section provides a description of the Proposed Project and Alternative 1. Section 2, Setting, provides a brief overview of the scientific basis and regulatory setting for carbon sequestration. Section 3, Methodology, describes the approach and modeling assumptions applied to conduct the analysis. Section 4, Loss of Sequestered Carbon, estimates the loss of sequestered carbon from the proposed removal of trees and vegetation. Section 5, Gain of Sequestered Carbon from Tree Plantings, estimates the gain of sequestered carbon from the proposed planting of trees. Section 6, Conclusions, provides a summary of the results. Section 7, References, includes a list of the references cited, and Section 8, Preparers, includes a list of those who prepared this report.

1.2 Project Description

Proposed Project

The projects that are evaluated within the Draft Environmental Impact Report (EIR), prepared pursuant to the California Environmental Quality Act, include the projects recommended in the Airport Master Plan's (AMP) capital improvement program, as well as the AMP's overall on-airport land use plan (which could include non-aviation development and redevelopment on the airport property). Proposed short-term development projects (occurring within ten years) are evaluated within the EIR at a project-specific level, while future long-term development projects (occurring within 20 years) are evaluated to the level of detail feasible based on available project information (i.e., at a programmatic level). Proposed long-term development projects would likely develop in phases over a long period of time, and future environmental analysis could be required prior to their approval and construction.

One primary aspect of the proposed AMP is a multi-component airport safety enhancement project. This project is known as the Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations (Airport Safety Enhancement Project). Due to the need for federal funding and approval, a federal Environmental Assessment is also being prepared consistent with the requirements of the National Environmental Policy Act. The Federal Aviation Administrative is the lead agency for the Environmental Assessment.

The proposed Airport Safety Enhancement Project includes the following and would be phased over approximately ten years (see Table 1, below):

- Relocate 44 general aviation (GA) hangars and a fuel tank from the southeast side of the Airport to the north side of the Airport
- Add up to 7 new GA hangars on the north side of the Airport
- Relocate the existing aircraft rescue and firefighting (ARFF) building and construct an ARFF service road
- Relocate the commercial terminal and necessary apron pavement (and associated parking and roadway improvements)
- Close Taxiway "K" at its connection with the new commercial terminal apron
- Implement a 52.5-foot southerly shift of 1,850 linear feet of Taxiway "A" and associated lighting, signage, and markings
- Remark hold lines on Taxiway "A" at Taxiway Connectors "G" and "J" to a 250-foot separation from the Runway 10L-28R centerline
- Install taxiway "islands" at Taxiway Connectors "G" and "J"
- Construct replacement vehicular parking along Fred Kane Drive

Other proposed short-term AMP projects include:

- Acquire a 5.5-acre private parcel near the proposed commercial terminal complex
- Construct a Highway 68 frontage road

Proposed long-term AMP projects include:

- Construct 106 new GA hangars on the north side of the Airport
- Redevelop the existing GA (small aircraft) hangar area (no increase in use intensity)
- Redevelop the existing airport industrial area (no increase in use intensity)

- Construct non-aviation uses on the north side of the Airport (north of Airport Road)
- Construct non-aviation uses on the south side of the Airport (north of Highway 68)
- Upgrade the perimeter fence
- Construct a consolidated maintenance building
- Acquire runway protection zone (RPZ) land (20 acres)
- Acquire RPZ navigation easement (14 acres)
- Extend Taxiway "B" to the Runway 28L threshold and construct geometry improvements for Taxiways "K" and "L"

One additional AMP project is construction of a new "north side" road, which would extend from Del Rey Gardens Drive in Del Rey Oaks (off Highway 218) to the northeast side of the Airport. Access to the north side of the Airport is currently provided via Airport Road, which runs through the Casanova Oak Knoll neighborhood, located northwest of the Airport. The new "north side" road would provide additional access to the north side of the Airport and would allow access through the Casanova Oak Knoll neighborhood for areas east of Gate 22 to be discontinued.

Comparison of Project Alternatives

There are two alternatives being considered in detail in the EIR: the Proposed Project and Alternative 1. The major difference between the two projects is the location of the permanent ARFF building and the timing of the construction of the "north side" road. Under the Proposed Project, the existing ARFF building would be permanently relocated on the south side of the Airport in the general location of the existing commercial terminal building. Since there would be up to a six- or seven-year gap between when the existing ARFF building would be demolished and the permanent ARFF building would be constructed, a temporary ARFF building would be necessary. This temporary ARFF building would be installed on the north side GA apron. An on-airport ARFF service road would be constructed to maintain acceptable on-airport emergency response times. However, for off-airport calls, the ARFF emergency vehicles would use existing Airport Road west through the Casanova Oak Knoll neighborhood since the new "north side" road would not yet be constructed. This would create longer off-airport emergency response times than currently occur.

Under Alternative 1, the existing ARFF building would be permanently relocated to the north GA apron at the same time as the southeast GA hangars and fuel tank are relocated to the north side. The new "north side" road would be constructed, as well as an on-airport ARFF service road, to provide acceptable on- and off-airport emergency response times.

Table 1 compares the phasing of the Safety Enhancement Project between the two alternatives:

Table 1
Comparison of Phasing for the Safety Enhancement Project
Proposed Project versus Alternative 1

Construction Phases	Proposed Project	Alternative 1
Phase 1	Years 1-3: Construct the necessary pavement and infrastructure to relocate approximately 44 GA tenants from the southeast part of the Airport to north of the airfield. Install a temporary ARFF facility on the Navy Flying Club apron.	Years 1-3: Construct the necessary pavement and infrastructure to relocate approximately 44 GA tenants from the southeast part of the Airport to north of the airfield. Concurrent with site preparation for the north side GA area, construct a 24-foot-wide "north side" road that would go from the north GA area to State Route 218 via a connection with Del Rey Garden Drive. Construct a permanent ARFF building in the general location of the existing Navy Flying Club buildings.
Phase 2	Years 4-8: Demolish the existing ARFF building and demolish or relocate the southeast GA facilities Construct a new commercial terminal complex (including apron, terminal loop road and roundabout, and vehicular parking lots and garage). Close Taxiway "K" between Runway 10R-28L and Taxiway "A."	Years 4-7: Demolish the existing ARFF building and demolish or relocate southeast GA facilities. Construct a new commercial terminal complex (including apron, terminal loop road and roundabout, and vehicular parking lots). Close Taxiway "K" between Runway 10R-28L and Taxiway "A."
Phase 3	Year 9: Demolish the existing terminal building. Construct a new ARFF building.	Year 8: Remark 1,850-lf portion of Taxiway "A" to 327.5 feet from Runway 10R-28L and relocate taxiway signage and lighting. Remark hold lines on Taxiways "G" and "J" at 250 feet from the Runway 10R-28L centerline. Provide apron islands at Taxiways "G" and "J." Demolish the existing terminal building.
Phase 4	Year 10: Remark 1,850-lf portion of Taxiway "A" to 327.5 feet from Runway 10R-28L and relocate taxiway signage and lighting. Remark hold lines on Taxiways "G" and "J" at 250 feet from the Runway 10R-28L centerline. Provide apron islands at Taxiways "G" and "J." Realign Fred Kane Drive and construct a second parking structure and surface parking lots, as needed.	Year 9: Construct replacement surface parking along Fred Kane Drive.

In addition to the new permanent ARFF building, the Proposed Project and Alternative 1 have differences in the type and amount of vehicular parking proposed for south of the new commercial terminal and along Fred Kane Drive. Under the Proposed Project, a net increase of 669 vehicular parking spaces for the commercial terminal complex in two parking garages and three surface lots is planned. Under Alternative 1, a net increase of 321 vehicular parking spaces for the commercial terminal complex in three surface lots is proposed.

Finally, depending on the alternative, a proposed Highway 68 frontage road would also be changed. Under the Proposed Project it is planned as a full loop, while under Alternative 1 it is planned as a cul-de-sac to avoid some of the rare plants located in the area. The proposed acquisition of a 5.5-acre parcel near the proposed commercial terminal complex would occur under either alternative as would all future long-term projects.

INTENTIONALLY LEFT BLANK

2 SETTING

2.1 Carbon Sequestration Scientific Basis

Carbon sequestration is the process by which CO_2 is removed from the atmosphere and deposited into a carbon reservoir (e.g., vegetation). Trees and vegetation take in CO_2 from the atmosphere during photosynthesis, break down the CO_2, store the carbon within plant parts, and release the oxygen back into the atmosphere. The removal of trees and other vegetation would be required as a result of the Proposed Project and Alternative 1, thereby removing stored carbon from the site and reducing future sequestration capability. The Proposed Project and Alternative 1 would also plant trees to mitigate potential impacts, and these newly planted trees would store new carbon as their wood mass increases via normal growth.

2.2 Regulatory Setting

The Proposed Project site is located within the North Central Coast Air Basin and is within the jurisdictional boundaries of the Monterey Bay Air Resources District. Currently, neither the County of Monterey nor the Monterey Bay Air Resources District has adopted or established guidance for carbon sequestration analyses.

INTENTIONALLY LEFT BLANK

3 METHODOLOGY

3.1 Overview

Two models were used to estimate the carbon loss associated with removal of trees and vegetation, as well as the carbon gain from planting new trees. The analysis of loss of sequestered carbon from removing trees and the carbon sequestration associated with planting new trees is based on calculation tools included in the i-Tree software package for the Proposed Project and Alternative 1. Specifically, carbon values were calculated for all mapped trees on site as well as projected values associated with proposed tree plantings.

To evaluate the loss of sequestered carbon associated with removal of vegetation, the calculation methodology and default values provided in the California Emission Estimator Model (CalEEMod) Version 2016.3.2, User's Guide (Appendix A Calculation Details) were used (CAPCOA 2017). To calculate potential CO_2 emissions associated with the one-time change in carbon sequestration capacity of a vegetation land use type, CalEEMod utilizes data and formulas based on the Intergovernmental Panel on Climate Change (IPCC) reports.

Planting trees that will sequester new CO_2 is considered in CalEEMod to result in a one-time carbon-stock change. Consistent with CalEEMod, which is the industry standard criteria air pollutant and greenhouse gas emissions estimator model, this analysis assumes that the sequestered carbon from planting new trees is a one-time occurrence. Trees sequester CO_2 while they are actively growing and the amount of CO_2 sequestered depends on the type of tree. Thereafter, the accumulation of carbon in biomass slows with age, and is assumed to be offset by losses from clipping, pruning, and occasional death. Active growing periods are subject to, among other things, species, climate regime, and planting density; however, for modeling purposes, CalEEMod assumes the IPCC active growing period of 20 years.

It is assumed that all sequestered carbon from the removed vegetation will be returned to the atmosphere; that is, the wood from removed trees and vegetation would not be re-used in a solid form or another form that would retain carbon. The loss of sequestered carbon modeling does not include CO_2 emissions estimates associated with vegetation clearing or removal activities (i.e., "clear and grub"), the transport of vegetative biomass offsite, or the disposal process (e.g., chipping or burning). Greenhouse gas emissions generated during construction activities, including clearing, tree removal, and grading, are estimated in the EIR analysis prepared for the Proposed Project. The sequestered carbon from new trees modeling does not include CO_2 emissions estimates associated with planting, care, and maintenance activities (e.g., tree planting and care, vehicle travel, and maintenance equipment operation). Maintenance activities are anticipated to include the use of hand and small power tools and would not require routine

operation of heavy equipment. Furthermore, maintenance is anticipated to be performed by existing staff. As such, operational greenhouse gas emissions associated with these maintenance activities are anticipated to be minimal.

3.2 Carbon Content Factors

3.2.1 Individual Tree Carbon Content

To evaluate the carbon content of trees proposed for removal, calculations of sequestered carbon, by individually-mapped tree, were performed using i-Tree software, as described below.

To calculate the carbon content of trees on the project site, an analysis of the tree inventory data for the project site (SWCA Environmental Consultants 2018) was conducted using the i-Tree software suite. The i-Tree software suite is a peer-reviewed software program developed and provided by the United States Forest Service (USFS). Eco, an application of the i-Tree software suite (i-Tree Eco 2018), is a model based application that allows users to collect data on an entire tree population and estimate the ecosystem services that the trees provide. Ecosystem services are the environmental benefits provided by urban trees, which include sequestering atmospheric carbon. Eco requires users to collect a minimum of two tree measurements to run the model, species, and trunk diameter at breast height (DBH). While this approach allows users with limited existing inventories to run the model, it also has limitations.

To initiate the i-Tree Eco analysis, the project site's tree inventory data was imported into the Eco application. Specifically, tree identification number, species, and DBH were imported from the inventory to optimize the accuracy of the ecosystem service estimates based on all available information. The data used to run the models discussed herein (SWCA Environmental Consultants 2018) only included species and DBH; therefore, inclusion of additional tree measurement data (e.g., tree height, canopy width, tree health) was not possible. Accordingly, the Eco application makes assumptions based on typical characteristics of the species to create these additional tree measurements.

Following data entry, the i-Tree Eco model was run and total carbon storage estimates were calculated for each tree. The i-Tree Eco software presents sequestered carbon totals in pounds of carbon. To convert this value to metric tons (MT) CO_2, the following equation was used:

$$\text{MT } CO_2 = (\text{Carbon (pounds)} \times 3.67) \times 0.0004535924$$

A summary of estimated sequestered carbon for the project's tree inventory for the Monterey Airport Master Plan (SWCA Environmental Consultants 2018), by tree species, is presented in Table 2. Individual tree carbon storage estimates are presented in Appendix A.

Table 2
Total Estimated Sequestered Carbon for the Monterey Regional Airport's Proposed Master Plan and Associated Development Projects Tree Inventory

Species	Tree Quantity	Total Metric Tons CO_2
Acacia sp.	13	20.74
Black Cottonwood	2	1.66
Coast Live Oak	1,031	1,358.65
Eucalyptus	8	91.28
Italian Stone Pine	2	0.77
Monterey Cypress	34	62.48
Monterey Pine	695	692.44
Pepper	9	8.69
Total	**1,794**	**2,236.71**

Notes: See Appendix A.
CO_2 = carbon dioxide.

To evaluate the quantity of carbon to be sequestered through future tree planting efforts, calculations were made using the i-Tree Planting Calculator (v1.1.3). The i-Tree Planting Calculator (i-Tree Planting 2018) uses species-based biomass equations and geographic variables to calculate sequestered carbon content for tree planting projects. For this analysis, it was assumed that the Airport will mitigate for a portion of the tree impacts associated with implementation of the Proposed Project and Alternative 1 by replanting 200 coast live oak (*Quercus agrifolia*) trees. Trees were assumed to be commonly-available 15-gallon container stock with trunk diameter measurements of 1-inch at the time of planting. The analysis also assumed that the trees would be planted in full sun and included a tree mortality factor of 10 percent. Finally, consistent with the CalEEMod program and IPCC standards, an active growing period of 20 years was assumed. As with the i-Tree Eco software, the i-Tree Planting Calculator presents sequestered carbon totals in pounds of carbon. To convert this value to MT CO_2, the following equation was used:

$$\text{MT } CO_2 = (\text{Carbon (pounds)} \times 3.67) \times 0.0004535924$$

The output summary table generated from the i-Tree Planting Calculator is included as Appendix B.

3.2.2 Default CalEEMod Carbon Content Factors

CalEEMod calculates potential CO_2 releases associated with vegetation removal activities resulting from land use change and provides default annual carbon accumulation per acre for six[1]

[1] Forest land (scrub), forest land (trees), cropland, grassland, wetlands, and other.

general IPCC vegetation classifications. The mass of sequestered carbon per unit area (expressed in units of MT of CO_2 per acre) is dependent on the vegetation type. Assuming that the sequestered carbon is released as CO_2 after removal of the vegetation, CalEEMod estimates annual CO_2 by multiplying total biomass (metric tons of dry matter per acre) from IPCC data by the carbon fraction in plant material, and then converts metric tons of carbon to metric tons of CO_2 based on the molecular weights of carbon and CO_2. CalEEMod default carbon content values were assumed to estimate the loss of sequestered carbon (release of CO_2) from the removal of grassland/ruderal (represented in CalEEMod as grassland, 4.31 MT CO_2 per acre) and shrubland (represented in CalEEMod as scrub, 14.3 MT CO_2 per acre) vegetation categories, which are based on data and formulas provided in the IPCC reports.

4 LOSS OF SEQUESTERED CARBON

4.1 Loss of Sequestered Carbon in Trees

Inventory data provided for the project (SWCA Environmental Consultants 2018) included designations of impact (removal), by individual tree for the Proposed Project and Alternative 1. Following calculations of MT CO_2 sequestered by individual trees, the data set was queried to determine the quantity of sequestered carbon in trees proposed for removal.

Table 3 presents the loss of sequestered carbon in trees for the Proposed Project.

Table 3
Estimated Loss of Sequestered Carbon in Trees - Proposed Project

Species	Tree Quantity	Total Metric Tons CO_2
Acacia sp.	9	16.44
Black Cottonwood	2	1.66
Coast Live Oak	705	917.42
Eucalyptus	6	55.48
Italian Stone Pine	2	0.77
Monterey Cypress	8	20.73
Monterey Pine	323	381.62
Pepper	9	8.69
Total	**1,064**	**1,402.81**

Notes: See Appendix A.
CO_2 = carbon dioxide.

As presented in Table 3, the loss of sequestered carbon resulting from removal of 1,064 trees for the Proposed Project would be approximately 1,403 metric tons CO_2.

Table 4 presents the loss of sequestered carbon in trees for Alternative 1.

Table 4
Estimated Loss of Sequestered Carbon in Trees - Alternative 1

Species	Tree Quantity	Total Metric Tons CO_2
Acacia sp.	9	16.44
Black Cottonwood	2	1.66
Coast Live Oak	657	905.71
Eucalyptus	6	55.48
Italian Stone Pine	2	0.77
Monterey Cypress	24	42.23
Monterey Pine	305	384.25

Table 4
Estimated Loss of Sequestered Carbon in Trees - Alternative 1

Species	Tree Quantity	Total Metric Tons CO_2
Pepper	9	8.69
Total	**1,014**	**1,415.22**

Notes: See Appendix A.
CO_2 = carbon dioxide.

As presented in Table 4, the loss of sequestered carbon resulting from removal of 1,014 trees for Alternative 1 would be approximately 1,415 metric tons CO_2. While there is a net reduction in the quantity of trees removed under Alternative 1 as compared with the Proposed Project, the higher sequestered carbon loss value under Alternative 1 is attributed to the sizes of the removed trees. Specifically, there is a higher number of larger trees identified for removal under Alternative 1 than under the Proposed Project. This difference results in a higher sequestered carbon loss total as tree size is directly correlated with the quantity of sequestered carbon for each tree.

4.2 Loss of Sequestered Carbon from Vegetation

As discussed in Section 3.2.2, the loss of sequestered carbon is estimated based on the carbon content for each vegetation land use type (MT CO_2 per acre) as provided in CalEEMod (CAPCOA 2017) and the loss of acreage for each vegetation land use type as provided in the *Monterey Regional Airport Master Plan Tree and Vegetation Type Inventory* report (SWCA Environmental Consultants 2018). The vegetation classifications provided in the *Monterey Regional Airport Master Plan Tree and Vegetation Type Inventory* report reflect the vegetation community (understory) without the tree species considered to avoid double counting.

The Proposed Project would permanently impact 25.6 acres of grassland/ruderal and 18.90 acres of shrubland (SWCA Environmental Consultants 2018). The loss of sequestered carbon associated with Proposed Project vegetation removal is presented in Table 5.

Table 5
Estimated Loss of Sequestered Carbon in Vegetation - Proposed Project

Project Vegetation Land Use	Vegetation Land Use Category	Vegetation Land Use Category Subtype	Biogenic CO_2 Emissions (MT CO_2/acre)	Net Loss (acres)	Sequestered Carbon (Metric Tons CO_2)
Grassland/Ruderal	Grassland	Grassland	4.31	25.60	110.34
Shrubland	Forest Land	Scrub	14.3	18.90	270.27
Total					**380.61**

Notes: See Appendix C.
CO_2 – carbon dioxide.

As presented in Table 5, Proposed Project removal of grassland/ruderal and shrubland would result in the release of approximately 381 MT CO_2.

Alternative 1 would permanently impact 25.2 acres of grassland/ruderal and 18.20 acres of shrubland (SWCA Environmental Consultants 2018). The loss of sequestered carbon associated with Alternative 1 vegetation removal is presented in Table 6.

Table 6
Estimated Loss of Sequestered Carbon in Vegetation – Alternative 1

Project Vegetation Land Use	Vegetation Land Use Category	Vegetation Land Use Category Subtype	Biogenic CO_2 Emissions (MT CO_2/acre)	Net Loss (acres)	Sequestered Carbon (Metric Tons CO_2)
Grassland/Ruderal	Grassland	Grassland	4.31	25.20	108.61
Shrubland	Forest Land	Scrub	14.3	18.20	260.26
Total					**368.87**

Notes: See Appendix C.
CO_2 – carbon dioxide.

As presented in Table 6, Alternative 1 removal of grassland/ruderal and shrubland would result in the release of approximately 369 MT CO_2.

INTENTIONALLY LEFT BLANK

5 GAIN OF SEQUESTERED CARBON FROM TREE PLANTINGS

The results of the i-Tree Planting Calculator revealed that a total of 2,537.2 pounds of CO_2 would be sequestered by each planted coast live oak tree at the end of a 20-year growing period. Collectively, 200 planted trees would sequester 507,440 pounds of CO_2 over this same timeframe. Based on the conversion formula presented in Section 3.2.1, the 200 planted coast live oak trees during implementation of the Proposed Project or Alternative 1 would sequester 844.73 MT CO_2 at the end of a 20-year growing period.

INTENTIONALLY LEFT BLANK

6 CONCLUSIONS

Implementation of the Proposed Project and Alternative 1 would result in a loss of sequestered carbon due to tree and vegetation removal on site, but would also sequester new carbon by planting trees onsite. Table 7 presents the estimate net change in sequestered carbon resulting from implementation of the Proposed Project and Alternative 1.

Table 7
Estimated Net Change in Sequestered Carbon

Category	Metric Tons CO_2
Proposed Project	
Loss of Sequestered Carbon in Trees	1,402.81
Loss of Sequestered Carbon in Vegetation	380.61
Gain of Sequestered Carbon from Tree Plantings	(844.73)
Net Change	**938.69**
Alternative 1	
Loss of Sequestered Carbon in Trees	1,415.22
Loss of Sequestered Carbon in Vegetation	368.87
Gain of Sequestered Carbon from Tree Plantings	(844.73)
Net Change	**939.36**

Notes: See Appendices A and B.
CO_2 – carbon dioxide.
Numbers in parentheses represent negative numbers.

As shown in Table 7, the net change in sequestered CO_2 from implementation of the Proposed Project is approximately 939 MT CO_2. The net change in sequestered CO_2 from implementation of Alternative 1 is approximately 939 MT CO_2. Accordingly, implementation of the Proposed Project and Alternative 1 would result in approximately the same release of CO_2 into the atmosphere as a result of loss of sequestered carbon associated with tree and vegetation removal, and the gain of sequestered carbon from planting trees.

APPENDIX C

Loss of Sequestered Carbon from Vegetation

Vegetation

Land Use Change - Loss of Sequestered Carbon

A development which changes land use type results in changes in CO_2 sequestration from the atmosphere which would not have been captured had there been no land-type change.

Equation:

Sequestered CO_2 (MT CO_2) = Σ_f ($SeqCO_2$)$_f$ x (area)$_f$ - Σ_i (SeqCO2)$_i$ x (area)$_i$

Where:

$SeqCO_2$ = mass of sequestered CO_2 per unit area (MT CO_2/acre)

area = area of land for specific land use type (acre)

f = index for final land use type

I = index for initial land use type

Default CalEEMod Factors

The mass of sequestered CO_2 per unit area (MT CO_2/acre) is dependent on the specific land use type. The program uses default CO_2 sequestration values from the California Climate Action Registry for each land use that will be preserved or created:

Vegetation Land Use Type	Vegetation Land Use Subtype	Biogenic CO_2 Emissions (MT CO_2/Acre)
Cropland	Cropland	6.2
Forest Land	Scrub	14.3
Forest Land	Trees	111
Grassland	Grassland	4.31
Wetlands	Wetlands	0
Others	Others	0

Notes:

Based on values indicated in IPCC Guidelines for National Greenhouse Gas Inventories (IPCC Guidelines). Available online at http://www.ipcc-nggip.iges.or.jp/public/2006gl/

Reference:

CalEEMod Users Guide, Appendix A Calculation Details (Section 11 Vegetation)

Calculations:

Proposed Project

Project Vegetation Land Use	Vegetation Land Use Category	Vegetation Land Use Category Subtype	Initial Acres (acres)	Final Acres (acres)	Net Loss (acres)	Biogenic CO_2 Emissions ($MT\ CO_2$/Acre)	Sequestered CO_2 ($MT\ CO_2$)
Grassland/Ruderal	Grassland	Grassland	25.60	0.00	25.60	4.31	110.34
Shrubland	Forest Land	Scrub	18.90	0.00	18.90	14.3	270.27
Total			**44.50**	**0.00**	**44.50**		**380.61**

Alternative 1

Project Vegetation Land Use	Vegetation Land Use Category	Vegetation Land Use Category Subtype	Initial Acres (acres)	Final Acres (acres)	Net Loss (acres)	Biogenic CO_2 Emissions ($MT\ CO_2$/Acre)	Sequestered CO_2 ($MT\ CO_2$)
Grassland/Ruderal	Grassland	Grassland	25.20	0.00	25.20	4.31	108.61
Shrubland	Forest Land	Scrub	18.20	0.00	18.20	14.3	260.26
Total			**43.40**	**0.00**	**43.40**		**368.87**

Notes:

The default annual CO2 is calculated by multiplying total biomass (MT dry matter/acre) from IPCC data by the carbon fraction in plant material (0.47), then using the ratio of molecular weights (44/12) to convert from MT of carbon (C) to MT of carbon dioxide (CO2).

Vegetation Type

Vegetation types are defined by IPCC as follows:

Forest Land

This category includes all land with woody vegetation consistent with thresholds used to define Forest Land in the national greenhouse gas inventory. It also includes systems with a vegetation structure that currently fall below, but *in situ* could potentially reach the threshold values used by a country to define the Forest Land category.

Grassland

This category includes rangelands and pasture land that are not considered Cropland. It also includes systems with woody vegetation and other non-grass vegetation such as herbs and brushes that fall below the threshold values used in the Forest Land category. The category also includes all grassland from wild lands to recreational areas as well as agricultural and silvi-pastural systems, consistent with national definitions.

Area

The user must specify area of land in acres for specific final and initial land use types. These area changes include not only the area of land that will be converted to buildings, but also areas disrupted by the construction of utility corridors, water tank sites, and associated borrow and grading areas. Areas temporarily disturbed that will eventually recover to become vegetated will not be counted as vegetation removed as there is no net change in vegetation or land use.

This assumption facilitates the calculation as a yearly growth rate and CO2 removal rate does not have to be calculated. As long as the disturbed land will indeed return to its original state, this assumption is valid for time periods over 20 years.

Monterey Regional Airport's Proposed Master Plan and Associated Development Projects

MONTEREY
REGIONAL AIRPORT

Appendix K

AIRCRAFT NOISE MODELING ASSUMPTIONS

APPENDIX K
AIRCRAFT NOISE MODELING ASSUMPTIONS

Introduction

This appendix includes documentation of the noise modeling assumptions for the 2015, 2025, and 2035 Community Noise Equivalent Level (CNEL) noise contours prepared for the *Monterey Regional Airport Master Plan* Environmental Impact Report using the Federal Aviation Administration's (FAA) Aviation Environmental Design Tool (AEDT) for aircraft noise environmental documentation. This analysis reflects recent changes in operating procedures at the airport.

The AEDT works by defining a network of grid points at ground level around the Airport. It then selects the shortest distance from each grid point to each flight track and computes the noise exposure for each aircraft operation by aircraft type and engine thrust level, along each flight track. Corrections are applied for air-to-ground acoustical attenuation, acoustical shielding of the aircraft engines by the aircraft itself, and aircraft speed variations. The noise exposure levels for each aircraft are summed at each grid location. For this EIR, the CNEL at all grid points was used to develop noise exposure contours for selected values (e.g., 65, 70, and 75 CNEL). Noise contours were then plotted on a base map of the airport environs using the CNEL metrics.

In addition to the mathematical procedures defined in the model, the AEDT also includes a database with tables correlating noise, thrust settings, and flight profiles for most of the civilian aircraft and many common military aircraft operating in the United States. This database, often referred to as the noise curve data, has been developed under FAA guidance based on rigorous noise monitoring in controlled settings. In fact, the AEDT database was developed through more than a decade of research, including extensive field measurements of more than 10,000 aircraft operations. The database also includes performance data for each aircraft to allow for the computation of airport-specific flight profiles (rates of climb and descent). AEDT Version 2c was used for modeling the noise condition, which was the current version at the start of this analysis.

The following sections outline the aircraft fleet mix, operations, time-of-day, runway use, flight tracks, flight profiles, and description of the noise exposure contours.

Activity Data

Airport activity is defined as the take-offs and landings by aircraft operating at the facility; this is also referred to as aircraft operations. Activity is further described as either local, indicating aircraft practicing take-offs and landings (i.e., performing touch-and-go's), or itinerant, refer-ring to the initial departure from or final arrival at the airport.

Table K1 provides a summary of operations for the existing condition (2015) and two forecast years (2025 and 2035). Existing airport activity (i.e., take-offs and landings, or operations by aircraft) for 2015 was estimated using data collected from the FAA Enhanced Traffic Management System Counts (ETMSC) and the forecast operations were collected from the Draft Airport Master Plan.

Fleet Mix

The selection of individual aircraft types is important to the modeling process because different aircraft types generate different noise levels. The aircraft fleet mix was derived from an inventory of existing operations at the airport. **Table K1** summarizes the generalized fleet mix data input into the noise analysis.

Database Selection

In order to select the proper aircraft from the AEDT database, a review of the current fleet mix for Monterey Regional Airport was conducted. Different aircraft types generate different noise levels; therefore, selection of individual aircraft plays an important role in the noise modeling process. The following paragraphs outline the database selections used for input into the AEDT.

Table K1 lists the annual operations by aircraft type. The included aircraft were selected to provide a realistic representation of airport operations. Flight plans, airline flight schedules, airfield observations, and based aircraft lists were used to determine the types of aircraft which frequently use the airport. To accurately represent the noise conditions at the airport, the AEDT aircraft fleet database includes approximately 3,000 airframe and engine combinations. No user-defined aircraft or profiles requiring FAA approval were used in the AEDT modeling. For those aircraft not specifically identified in the AEDT, the FAA provides a list of appropriate substitute aircraft.

The FAA aircraft substitution list indicates that the general aviation single engine variable-pitch propeller model, the GASEPV, represents a number of single engine general aviation aircraft. Among others, these include the Beech Bonanza, Cessna 177 and 180, Piper Cherokee Arrow, and Cessna Caravan. The general aviation single engine fixed-pitch propeller model, the GASEPF, also represents several single engine general aviation aircraft. These include the Cessna 150 and 172, Piper Archer, and the Piper Tomahawk.

The FAA's substitution list included with the AEDT documentation identifies the BEC58P, the Beech Baron, as a substitute for light twin-engine aircraft such as Beech 50, Beech 55, Piper PA-23, PA-30, PA-34, Cessna 304, Cessna 310, and Cessna 401 among others. Additionally, the Cessna 182, 206, 208, and 441 are modeled with their respective AEDT designators (CNA182, CNA206, CNA208, and CNA441). The Short 330 turboprop is modeled with its respective designator the SD330. General aviation helicopter operations are represented by the SA350D.

A wide variety of business jets operate at Monterey Regional Airport. The AEDT provides data for all but the Falcon 50. The AEDT approved designator for the Falcon 50 is the COMJET. The remaining business jets were modeled with respective AEDT designators as listed in **Table K1**.

Source: Coffman Associates analysis

To account for commercial and air cargo operations, the following aircraft and corresponding designators were modeled: Canadair CRJ-200 (CL601), Canadair CRR-900 (GV), Embraer 145 (EMB145), Embraer 120 (EMB120), Dash 9 (DHC8), Cessna 208 (CNA208), and McDonnell Douglas MD-83 (MD83). Commercial aircraft forecast for Monterey Regional Airport include the Boeing 737-700 and Airbus 319. These aircraft are represented in the AEDT by the 737700 and A319-131 designators.

Military operations at Monterey Regional Airport include a twin turboprop aircraft, which was modeled as the CVR580, the C-130 aircraft modeled by the C130E, and the F-18 fighter jet, which is modeled by the F-18. Military helicopters were modeled with the S70 AEDT designator.

Time-of-Day

The time-of-day which aircraft operations occur is an important component of the AEDT model and depends on the noise metric used to represent noise conditions. As previously discussed, CNEL adds additional weight to operations that occur during evening and nighttime hours. During the evening (7:00 p.m.-10:00 p.m. an additional 4.77 dB is added to all aircraft operations and 10 dB is added to all aircraft operations between 10:00 p.m. to 7:00 a.m. to represent the increased sensitivity that residents might have during evening and nighttime hours. When calculating aircraft noise exposure, one nighttime operation is equal to ten daytime operations resulting from the penalty.

While Monterey Regional Airport does have an airport traffic control tower (ATCT), it is closed between 9:00 p.m. and 6:00 a.m. Specific counts for nighttime activity were estimated based on an interview with the ATCT manager and commercial flight schedules. This percentage of operations was also applied to both future forecast scenarios.

Runway Use

Runway usage data is also an essential component for developing noise exposure contours in the AEDT. Local wind data can be used as a general guideline for determining runway use percentages. However, local wind data provides only the directional availability of a runway and does not consider pilot selection, primary runway operations, or local operating conventions. Continuous runway use records are not maintained by the airport. The runway use distribution at Monterey Regional Airport was established through discussions with the ATCT manager. **Table K2** summarizes the runway use percentages for the existing and future conditions.

TABLE K2
Runway Use Percentages by Aircraft Type
Monterey Regional Airport

	Arrivals and Departures			Touch-and-Go
Runway	Business/ Regional Jet	Turboprop/ Multi-Engine	Single Engine Piston	Single/Multi-Engine Piston

28L	75%	75%	71%	15%
10L	0%	0%	1%	20%
28R	0%	0%	4%	60%

Source: Interview with Monterey Peninsula Airport Traffic Control Tower Manager (2013).

Flight Tracks

A review of local and regional air traffic control procedures and radar flight tracks, conducted during the 2008 14 CFR Part 150 Noise Exposure Maps updated for the airport, was used to develop consolidated flight tracks for use in the AEDT. The resulting analysis is a series of flight tracks describing the typical flight corridors used for aircraft arriving and departing Monterey Peninsula Airport.

As illustrated on **Exhibit K1**, arrivals occur primarily on Runway 10R-28L and begin a straight-in approach well beyond the end of the runway. A smaller number of arrivals occur over Monterey Bay and align with the runway at a shorter distance.

A majority of the departure tracks lead to the northwest and northeast. Runway 28L departure tracks turn to the northwest, following the airport's departure procedure. Runway 10L disperses primarily to the north and northeast.

Touch-and-go, or training operations, occur on the north side of the airport in accordance with the air-port's standard training pattern. These tracks are indicated in green and create an oval circling pattern.

Exhibit K2 depicts the consolidated departure flight tracks, based on the radar flight track in-formation and discussions with the Airport Traffic Control Tower Manager developed for input into the AEDT. The consolidated flight tracks are developed by plotting the centerline of a concentrated group of tracks and then dispersing tracks into multiple sub-tracks that conform to the radar flight track data. The thin, light blue lines on **Exhibit K2** represent the radar data for departures acquired from the Marina radar facility. The widest dark blue lines represent the AEDT track centerline, or spine, of each group of radar track data. The medium lines represent the dispersed AEDT flight tracks for each group of departure tracks.

Touch-and-go operations, depicted on **Exhibit K3**, were also modeled as part of the noise analysis. Touch-and-go operations occur primarily on the north side of the airport. The series of concentric oval-shaped tracks represent the radar flight tracks and the observed variances of the training pattern at Monterey Regional Airport.

Helicopter arrival and departure flight tracks are illustrated on **Exhibit K4**. The primary locations for helicopter arrivals and departures are west of the terminal building at two of the fixed base operators. Much of the helicopter arrival activity occurs from the northeast, northwest, and west. Departures occur in all directions according to radar flight track data.

Flight Profiles

The standard arrival profile used in the AEDT program is a three-degree approach. No indication was given by airport staff that there was any variation on this standard procedure; there-fore, the standard approach was included in the model as representative of local operating conditions.

AEDT Version 2b computes the take-off profiles based on the user-supplied airport elevation and average annual temperature entries in the input batch. At Monterey Regional Airport, the elevation is 254 feet mean sea level (MSL) and the average annual temperature is 56 degrees Fahrenheit (F), based on infor-mation from the National Oceanic and Atmospheric Administration (NOAA). If other than standard

conditions (temperature of 59 degrees F and elevations of zero feet MSL) are specified by the user, the profile generator automatically computes the take-off profiles using the airplane performance coefficients in the database and equations in the Society of Aeronautical Engineers, Aerospace Information Report 1845 (SAE/AIR 1845).

The AEDT computes separate departure profiles (altitude at a specified distance from the airport with associated velocity and thrust settings) for each of the various types of aircraft using the airport.

AEDT Output

Output data selected for calculation by the AEDT are annual average noise contours in CNEL. The CNEL is a measure of the 24-hour noise level of a community to allow for comparison be-tween the proposed project and continuation of the existing condition.

Computer files developed from data described in the previous section provided input to the AEDT, which generated output files for years and alternatives being evaluated. Contours were prepared for the following: existing condition (2015) depicted on **Exhibit K5**, 2025 depicted on **Exhibit K6**, and 2035 depicted on **Exhibit K7**. A depiction of the noise analysis results is contained within the following sections.

EXECUTIVE SUMMARY

The purpose of this technical report is to assess the potential noise impacts associated with the implementation of the proposed Monterey Airport Master Plan (AMP) Project (Proposed Project). This assessment utilizes the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines.

One primary aspect of the Proposed Project is a multi-component airport safety enhancement project. This project is known as the Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations.

The proposed Airport Safety Enhancement Project includes the following and would be phased over approximately 10 years:

- Relocate 44 general aviation (GA) hangars and a fuel tank from the southeast side of the Airport to the north side of the Airport
- Add up to 7 new GA hangars on the north side of the Airport
- Relocate the existing aircraft rescue and firefighting (ARFF) building and construct an ARFF service road
- Relocate the commercial terminal and necessary apron pavement (and associated parking and roadway improvements)
- Close Taxiway "K" at its connection with the new commercial terminal apron
- Implement a 52.5-foot southerly shift of 1,850 linear feet of Taxiway "A" and associated lighting, signage, and markings
- Remark hold lines on Taxiway "A" at Taxiway Connectors "G" and "J" to a 250-foot separation from the Runway 10L-28R centerline
- Install taxiway "islands" at Taxiway Connectors "G" and "J"
- Construct replacement vehicular parking along Fred Kane Drive

Other proposed short-term AMP projects include:

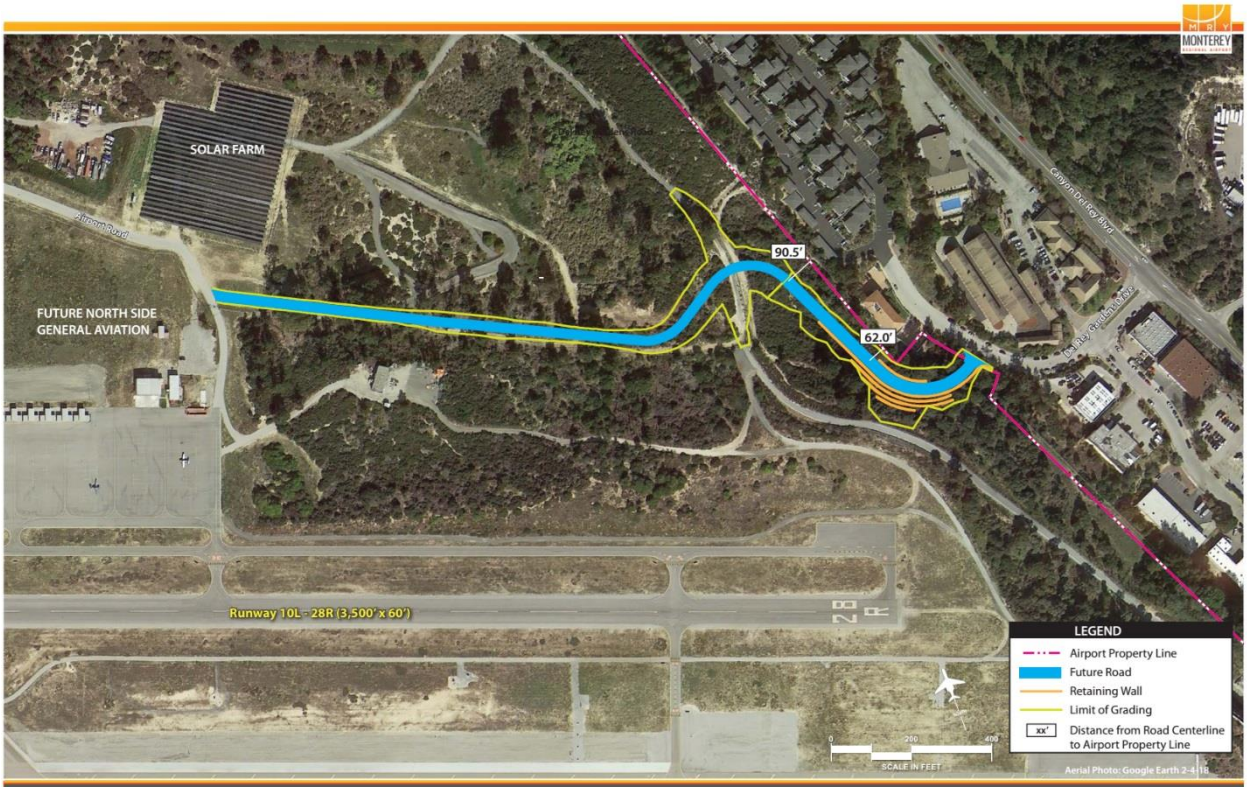
- Acquire a 5.5-acre private parcel near the proposed commercial terminal complex
- Construct a Highway 68 frontage road

Proposed long-term AMP projects include:

- Construct 106 new GA hangars on the north side of the Airport
- Redevelop the existing GA (small aircraft) hangar area (no increase in use intensity)
- Redevelop the existing airport industrial area (no increase in use intensity)
- Construct non-aviation uses on the north side of the Airport (north of Airport Road)
- Construct non-aviation uses on the south side of the Airport (north of Highway 68)
- Upgrade the perimeter fence
- Construct a consolidated maintenance building
- Acquire runway protection zone (RPZ) land (20 acres)
- Acquire RPZ avigation easement (14 acres)
- Extend Taxiway "B" to the Runway 28L threshold and construct geometry improvements for Taxiways "K" and "L"

One additional AMP project is construction of a new "north side" road, which would extend from Del Rey Gardens Drive in Del Rey Oaks (off Highway 218) to the northeast side of the Airport. Access to the north side of the Airport is currently provided via Airport Road, which runs through the Casanova Oak Knoll (CONA) neighborhood, located northwest of the Airport. The new "north side" road would provide additional access to the north side of the Airport and would allow access to be discontinued through the CONA neighborhood for areas east of Gate 22. Exhibit 1 shows the new "north side" road.

Exhibit 1. Proposed North Side Road Alignment



Noise levels from traffic along the major roadways in the Proposed Project vicinity were analyzed to determine traffic noise exposure levels for off-site noise-sensitive uses. The resultant exterior noise levels remain in the "acceptable" range when the Proposed Project traffic is added to the existing and cumulative average daily traffic data for the vicinity roads. The increases due to Proposed Project-related traffic are less than 1 dB at the modeled locations. In some cases, traffic levels decrease due to Proposed Project-related traffic patterns. Noise analyses for the new "north side" road are included in the traffic noise model. The addition of the north side road is not expected to produce a significant operational noise impact on the residential land uses in the vicinity. Use of north side road will also include emergency vehicles. While emergency vehicle noise from sirens may cause temporary annoyance, the operations are expected to be limited to infrequent emergency situations. Local noise regulations include exemptions for emergencies. Traffic noise from the north side road, including emergency vehicle use, are therefore less than significant.

Noise associated with short-term (construction) activities is potentially significant. Mitigation measures to address nighttime construction are included in the discussion. With the incorporation of these mitigation measures the construction noise impacts are expected to be less than significant.

1 INTRODUCTION

1.1 Purpose

The purpose of this report is to evaluate the potential noise impacts associated with implementation of the Monterey Airport Master Plan Project (Proposed Project) relative to the City of Monterey, County of Monterey, and City of Del Rey Oaks significance thresholds. The report includes a quantitative analysis of Proposed Project-related noise for construction and operational traffic.

1.2 Regional and Local Setting

The Proposed Project site is adjacent to the City of Monterey. Residential, institutional, and commercial land uses surround the Airport and Proposed Project site. Figure 1 shows the Proposed Project location. The Proposed Project site is generally bounded on all sides by the City of Monterey or the City of Del Rey Oaks. The City of Monterey's Noise Element (City of Monterey 2016) includes some descriptions of the region:

> The airport is surrounded by development, including the City of Monterey's Casanova Oak Knoll residential neighborhood, Ryan Ranch office/industrial park, Garden Road office park, U.S. Navy Golf Course, and Monterey County Fairgrounds.

1.3 Proposed Project Description

The projects that are evaluated within this Noise Report include the projects recommended in the Airport Master Plan's (AMP) capital improvement program, as well as the AMP's overall on-airport land use plan (which could include non-aviation development and redevelopment on the airport property). Proposed short-term development projects (occurring within 10 years) are evaluated at a project-specific level, while future long-term development projects (occurring within 20 years) are evaluated to the level of detail feasible based on available project information (i.e., at a programmatic level). Proposed long-term development projects would likely develop in phases over a long period of time, and future environmental analysis could be required prior to their approval and construction.

One primary aspect of the proposed AMP is a multi-component airport safety enhancement project. This project is known as the Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations (Airport Safety Enhancement Project). Due to the need for federal funding and approval, a federal environmental assessment (EA) is also being prepared consistent with the requirements of the National Environmental Policy Act (NEPA). The Federal Aviation Administrative (FAA) is the lead agency for the EA.

The proposed Airport Safety Enhancement Project includes the following and would be phased over approximately 10 years:

- Relocate 44 general aviation (GA) hangars and a fuel tank from the southeast side of the Airport to the north side of the Airport
- Add up to 7 new GA hangars on the north side of the Airport
- Relocate the existing aircraft rescue and firefighting (ARFF) building and construct an ARFF service road
- Relocate the commercial terminal and necessary apron pavement (and associated parking and roadway improvements)
- Close Taxiway "K" at its connection with the new commercial terminal apron
- Implement a 52.5-foot southerly shift of 1,850 linear feet of Taxiway "A" and associated lighting, signage, and markings
- Remark hold lines on Taxiway "A" at Taxiway Connectors "G" and "J" to a 250-foot separation from the Runway 10L-28R centerline
- Install taxiway "islands" at Taxiway Connectors "G" and "J"
- Construct replacement vehicular parking along Fred Kane Drive

Other proposed short-term AMP projects include:

- Acquire a 5.5-acre private parcel near the proposed commercial terminal complex
- Construct a Highway 68 frontage road

Proposed long-term AMP projects include:

- Construct 106 new GA hangars on the north side of the Airport
- Redevelop the existing GA (small aircraft) hangar area (no increase in use intensity)
- Redevelop the existing airport industrial area (no increase in use intensity)
- Construct non-aviation uses on the north side of the Airport (north of Airport Road)
- Construct non-aviation uses on the south side of the Airport (north of Highway 68)
- Upgrade the perimeter fence
- Construct a consolidated maintenance building
- Acquire runway protection zone (RPZ) land (20 acres)

- Acquire RPZ avigation easement (14 acres)
- Extend Taxiway "B" to the Runway 28L threshold and construct geometry improvements for Taxiways "K" and "L"

One additional AMP project is construction of a new "north side" road, which would extend from Del Rey Gardens Drive in Del Rey Oaks (off Highway 218) to the northeast side of the Airport. Access to the north side of the Airport is currently provided via Airport Road, which runs through the Casanova Oak Knoll (CONA) neighborhood, located northwest of the Airport. The new "north side" road would provide additional access to the north side of the Airport and would allow access through the CONA neighborhood for areas east of Gate 22 to be discontinued.

2 FUNDAMENTALS OF NOISE AND VIBRATION

The following is a brief discussion of fundamental noise concepts and basic terminology.

2.1 Sound, Noise, and Acoustics

Sound propagation is a process that consists of three components: the sound source, the sound path, and the sound receiver. All three components must be present for sound to propagate. Without a source to produce sound, there is no sound. Similarly, without a medium to transmit sound pressure waves, there is no sound transmitted. Finally, sound must reach a receiver; a hearing organ, sensor, or object must be present to perceive, register, or be affected by sound or noise. In most situations, there are many different sound sources, paths, and receptors. Acoustics is the field of science that deals with the production, propagation, reception, effects, and control of sound. Noise is defined as sound that is unpleasant, unexpected, or undesired.

2.2 Sound Pressure Levels and Decibels

Loudness of sound increases with increasing amplitude. Sound pressure amplitude is measured in units of micro-newton per square meter, also called a micropascal. One micropascal is approximately one-hundred billionth (0.00000000001) of normal atmospheric pressure. The pressure of a very loud sound may be 200 million micropascals, or 10 million times the pressure of the weakest audible sound. Because expressing sound levels in terms of micropascal would be very cumbersome, sound pressure level in logarithmic units is used instead to describe the ratio of actual sound pressure to a reference pressure squared. These units are called Bels. To provide a finer resolution, a Bel is subdivided into 10 decibels (dB).

2.3 A-Weighted Sound Level

Sound pressure level alone is not a reliable indicator of loudness. The frequency, or pitch, of a sound also has a substantial effect on how humans will respond. Although the intensity (energy per unit area) of the sound is a purely physical quantity, the loudness, or human response, is determined by the characteristics of the human ear.

Human hearing is limited not only in the range of audible frequencies, but also in the way it perceives the sound in that range. In general, the healthy human ear is most sensitive to sounds between 1,000 and 5,000 hertz, and it perceives a sound within that range as more intense than a sound of higher or lower frequency with the same magnitude. To approximate the frequency response of the human ear, a series of sound level adjustments is usually applied to the sound measured by a sound level meter. The adjustments (referred to as a weighting network) are frequency-dependent.

The A-scale weighting network approximates the frequency response of the average young ear when listening to ordinary sounds. When people make judgments about the relative loudness or annoyance of a sound, their judgments correlate well with the A-scale sound levels of those sounds. Noise levels are typically reported in terms of A-weighted sound levels. All sound levels discussed in this report are A-weighted decibels (dBA), unless otherwise stated. Examples of typical noise levels for common indoor and outdoor activities are depicted in Table 1.

Table 1
Typical Sound Levels in the Environment and Industry

Common Outdoor Activities	Noise Level (dB)	Common Indoor Activities
—	110	Rock band
Jet fly over at 300 meters (1,000 feet)	100	—
Gas lawn mower at 1 meter (3 feet)	90	—
Diesel truck at 15 meters (50 feet), at 80 kilometers per hour (50 miles per hour)	80	Food blender at 1 meter (3 feet); garbage disposal at 1 meter (3 feet)
Noisy urban area, daytime; gas lawn mower at 30 meters (100 feet)	70	Vacuum cleaner at 3 meters (10 feet)
Commercial area; heavy traffic at 90 meters (300 feet)	60	Normal speech at 1 meter (3 feet)
Quite urban, daytime	50	Large business office; dishwasher next room
Quite urban, nighttime	40	Theater; large conference room (background)
Quite suburban, nighttime	30	Library
Quite rural, nighttime	20	Bedroom at night; concert hall (background)
—	10	Broadcast/recording studio
Lowest threshold of human hearing	0	Lowest threshold of human hearing

Source: Caltrans 2013.

2.4 Human Response to Changes in Noise Levels

"It is generally accepted that the average healthy ear … can barely perceive a noise level change of 3 dB" (Caltrans 2013). A change of 5 dBA is readily perceptible, and a change of 10 dBA is perceived as twice or half as loud. A doubling of sound energy results in a 3 dBA increase in sound, which means that a doubling of sound energy (e.g., doubling the average daily numbers of traffic on a road) would result in a barely perceptible change in sound level.

2.5 Noise Descriptors

Additional units of measure have been developed to evaluate the long-term characteristics of sound. The equivalent sound level (L_{eq}) is also referred to as the time-average sound level. It is the equivalent steady-state sound level that in a stated period of time would contain the same acoustical energy as the time-varying sound level during the same time period. The 1-hour A-

weighted equivalent sound level, $L_{eq}(h)$, is the energy average of the A-weighted sound levels occurring during a 1-hour period.

People are generally more sensitive and annoyed by noise occurring during the evening and nighttime hours. Thus, another noise descriptor used in community noise assessments—the community noise equivalent level (CNEL)—was introduced. The CNEL scale represents a time-weighted, 24-hour average noise level based on the A-weighted sound level. The CNEL accounts for the increased noise sensitivity during the evening hours (7:00 p.m. to 10:00 p.m.) and nighttime hours (10:00 p.m. to 7:00 a.m.) by adding 5 dBA and 10 dBA, respectively, to the average sound levels occurring during the evening and nighttime hours. CNEL or Day Night Level (L_{dn}[1]) are the basis for the County's noise standards.

2.6 Sound Propagation

Sound propagation (i.e., the passage of sound from a noise source to a receiver) is influenced by geometric spreading, ground absorption, atmospheric effects, and shielding by natural and/or built features. Sound levels attenuate (or diminish) at a rate of approximately 6 dBA per doubling of distance from an outdoor point source due to the geometric spreading of the sound waves. For a line source, such as vehicle traffic along a roadway, sound levels attenuate at a rate of approximately 3 dBA per doubling of distance. Atmospheric conditions such as humidity, temperature, and wind gradients can also temporarily alter sound levels. In general, the greater the distance the receiver is from the source, the greater the potential for variation in sound levels due to atmospheric effects. Additional sound attenuation can result from built features such as intervening walls and buildings, and by natural features such as hills and dense woods.

Additional definitions of common acoustical terms are provided in Appendix A.

[1] L_{dn} (also known as DNL) is comparable to CNEL, except that there is no evening component: the period from 7:00 a.m. to 10:00 p.m. is classified as daytime, and no adjustment to the noise levels is made during these hours; the period from 10:00 p.m. to 7:00 a.m. is classified as nighttime and 10 decibels is added to the hourly L_{eq}s occurring during these hours.

INTENTIONALLY LEFT BLANK

3 REGULATORY SETTING

3.1 State

California Department of Health Services Guidelines

The State Department of Health Services has developed guidelines of community noise acceptability for use by local agencies (OPR 2003). Selected relevant levels are listed here:

- Below 60 dBA CNEL: normally acceptable for low-density residential use
- 50 to 70 dBA: conditionally acceptable for low-density residential use
- Below 65 dBA CNEL: normally acceptable for high-density residential use
- 60 to 70 dBA CNEL: conditionally acceptable for high-density residential, transient lodging, churches, educational, and medical facilities.

The acceptable exterior noise level for low-density residential use of 60 dBA CNEL would be reduced by a typical residential building envelope to an interior level of not greater than 45 dBA CNEL.

Caltrans Guidelines

Guidance regarding the determination of a substantial permanent increase in ambient noise levels in the project vicinity above existing levels is provided by the Federal Highway Administration (FHWA) and California Department of Transportation (Caltrans). In Title 23 Part 772 of the Code of Federal Regulations (23 CFR 772), a substantial noise increase for federally funded transportation projects is defined as a range (to be determined by each state's transportation department) between 5 and 15 dBA above existing ambient levels (FHWA 2010). In the State of California, Caltrans defines a substantial noise increase as 12 dBA or more (Caltrans 2011). Because the project is located in California, the threshold of 12 dBA or more is used to define a substantial increase.

Guidance from Caltrans was used in this analysis for permanent substantial noise increase thresholds. Similarly, for temporary noise from construction, the Caltrans Standard Specification Section 14-8.02 (Noise Control) was used. Section 14-8.02 (Noise Control) requires that construction activity not exceed 86 dBA L_{max} at 50 feet from job site activities from 9:00 p.m. to 6:00 a.m. and that internal combustion engines be equipped with manufacturer-recommended mufflers (Caltrans 2011).

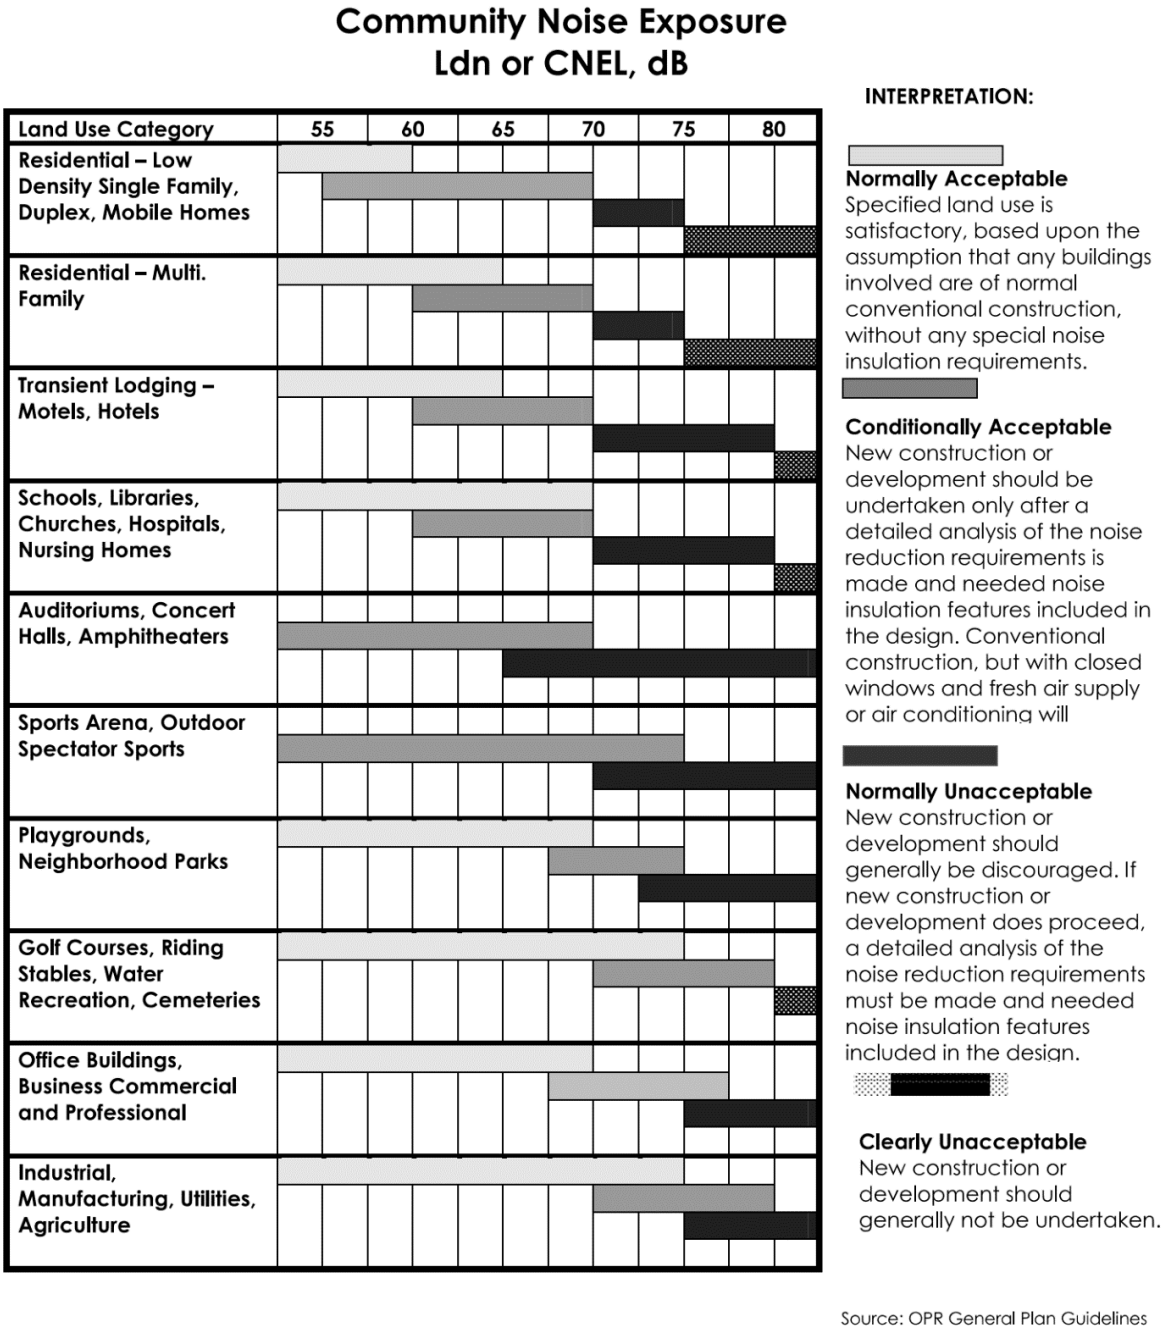
3.2 Local

City and County regulations are presented primarily for informational purposes and to add context to the noise level analyses. Traffic noise level increases resulting from the Proposed Project would be assessed using the regulations from the jurisdiction in which each road segment is located. However, noise from activities within the airport property (including construction) are not subject to these local regulations.

County of Monterey

Monterey County's exterior noise exposure standards are based on parameters established by the California Department of Health, Office of Noise Control and are presented in Table 2 (Table S-2 in the County Safety Element). Based on these standards, noise levels of 60 dBA L_{dn} or less are considered "normally acceptable." Generally, noise levels of 60 to 70 dBA L_{dn} are considered "conditionally acceptable" (County of Monterey 2010). With reference to the Proposed Project, off-site traffic noise exposure increases resulting from the Proposed Project along road segments located in the County would be subject to these exterior noise level criteria. These criteria would not be applicable to Airport operational noise located on-field.

Table 2
Community Noise Exposure L_{dn} or CNEL



Source: OPR General Plan Guidelines

Relevant policies from the County's Safety Element (County of Monterey 2010) are listed below:

- ***Policy S-7.2:*** Proposed development shall incorporate design elements necessary to minimize noise impacts on surrounding land uses and to reduce noise in indoor spaces to an acceptable level.
- ***Policy S-7.4:*** New noise generators may be allowed in areas where projected noise levels are "conditionally acceptable" only after a detailed analysis of the noise reduction requirements is made and needed noise mitigation features are included in project design.
- ***Policy S-7.5:*** New noise generators should generally be discouraged in areas identified as "normally unacceptable." Where such new noise generators are permitted, mitigation to reduce both the indoor and outdoor noise levels will be required.
- ***Policy S-7.6:*** Acoustical analysis shall be part of the environmental review process for projects when:

  b) Proposed noise generators are likely to produce noise levels exceeding the levels shown in the adopted Community Noise Ordinance when received at existing or planned noise-sensitive receptors.

- ***Policy S-7.8:*** All discretionary projects which propose to use heavy construction equipment that has the potential to create vibrations that could cause structural damage to adjacent structures within 100 feet shall be required to submit a pre-construction vibration study prior to the approval of a building permit. Projects shall be required to incorporate specified measures and monitoring identified to reduce impacts. Pile driving or blasting are illustrative of the type of equipment that could be subject to this policy.
- ***Policy S-7.9:*** No construction activities pursuant to a County permit that exceed "acceptable" levels listed in Policy S-7.1 (Table 2, which is Table S-2 in the County Safety Element) shall be allowed within 500 feet of a noise sensitive land use during the evening hours of Monday through Saturday, or anytime on Sunday or holidays, prior to completion of a noise mitigation study. Noise protection measures, in the event of any identified impact, may include but not be limited to:

  - Constructing temporary barriers; or
  - Using quieter equipment than normal.

- ***Policy S-7.10:*** Construction projects shall include the following standard noise protection measures:

  - Construction shall occur only during times allowed by ordinance/code unless such limits are waived for public convenience;

- All equipment shall have properly operating mufflers; and
- Lay-down yards and semi-stationary equipment such as pumps or generators shall be located as far from noise-sensitive land uses as practical.

In addition, the Monterey County Noise Control Ordinance (County of Monterey 2014) prohibits the operation of any device, which produces a noise level exceeding 85 dBA at a distance of 50 feet from the source, but does not apply to aircraft or any machine or device that is operated in excess of 2,500 feet from any occupied dwelling unit. Additionally, section 10.60.040 of the County Code apply to nighttime noise, in which it is prohibited to make, assist in making, allow, continue, create, or cause to be made any loud and unreasonable sound any day of the week from 10:00 p.m. to 7:00 a.m. the following morning within the unincorporated area of the County of Monterey. During this time period, a loud and unreasonable sound includes any sound that exceeds the exterior noise level standards set forth in Table 3:

Table 3
Exterior Noise Level Standards (Nighttime Only)

Nighttime hourly equivalent sound level (L_{eq} dBA)	45
Maximum level, dBA	65

Noise levels shall be measured using a Type 1 or Type 2 integrating sound level meter using the A-weighting network scale. The location of measurements shall be at or outside the property line of the property from which noise is emanating. Commercial agricultural operations, emergency vehicles, bells and chimes used for religious purposes or services, and specified outdoor gatherings are exempt from these requirements. As mentioned at the beginning of this section, City and County regulations are presented primarily for informational purposes and to add context to the noise level analyses. Noise from activities within the airport property (including construction) are not subject to these County regulations.

City of Monterey

The City of Monterey General Plan identifies the following goals for new development related to noise that may be applicable to the Proposed Project (City of Monterey 2016):

- ***Goal a:*** Minimize traffic noise in predominantly residential areas and ensure noise in commercial areas is at an acceptable level.
- ***Policy a.2:*** Route trucks and through traffic onto truck routes, even where such routing is not the shortest distance between points.

- ***Program a.2.1:*** Implement traffic calming measures in neighborhoods.
- ***Policy a.5:*** Protect areas adjacent to roadways and freeways with landscaped noise buffers or other means; sound walls should not be allowed.

b. Aircraft Noise

The Monterey Peninsula Airport is owned and operated by the Monterey Peninsula Airport District. The Airport is located directly adjacent to the City's border and encompasses approximately 600 acres. The Airport has two runways. Flight paths pass over various neighborhoods of the City.

The Monterey Peninsula Airport District has completed two studies: *Monterey Peninsula Airport Master Plan Update* (September 1992) and *FAR Part 150 Airport Noise Exposure Map Report* (November 1997). These studies estimate passenger growth and forecast operations. The actual passenger count has been substantially less than projected by the plans. In 2002, the actual passenger count was 380,000. Over the past several years, passenger growth has not met expectations so noise levels have been less than originally forecast. However, noise from general aviation and aircraft deviating from established flight paths and flying over neighborhoods are still a concern to the City.

- ***Policy b.1:*** Support improvements and operational changes at the airport that promote safety and noise reduction.
- ***Policy b.2:*** Work with the Airport District, Airport Land Use Commission, and surrounding cities in planning for appropriate land uses around the airport and developing solutions to existing noise problems.
- ***Policy b.3:*** Continue to encourage the airport to limit aircraft noise between the hours of 11 p.m. and 7 a.m.
- ***Policy b.4:*** Support limiting the number of fixed-base general aviation aircraft at the airport to the existing number.
- ***Policy b.5:*** Implement the following land use standards for properties that are exposed to noise levels in excess of 60 CNEL (Table 4, which is Table 8 in the City's General Plan).

Table 4
Noise Exposure Standards

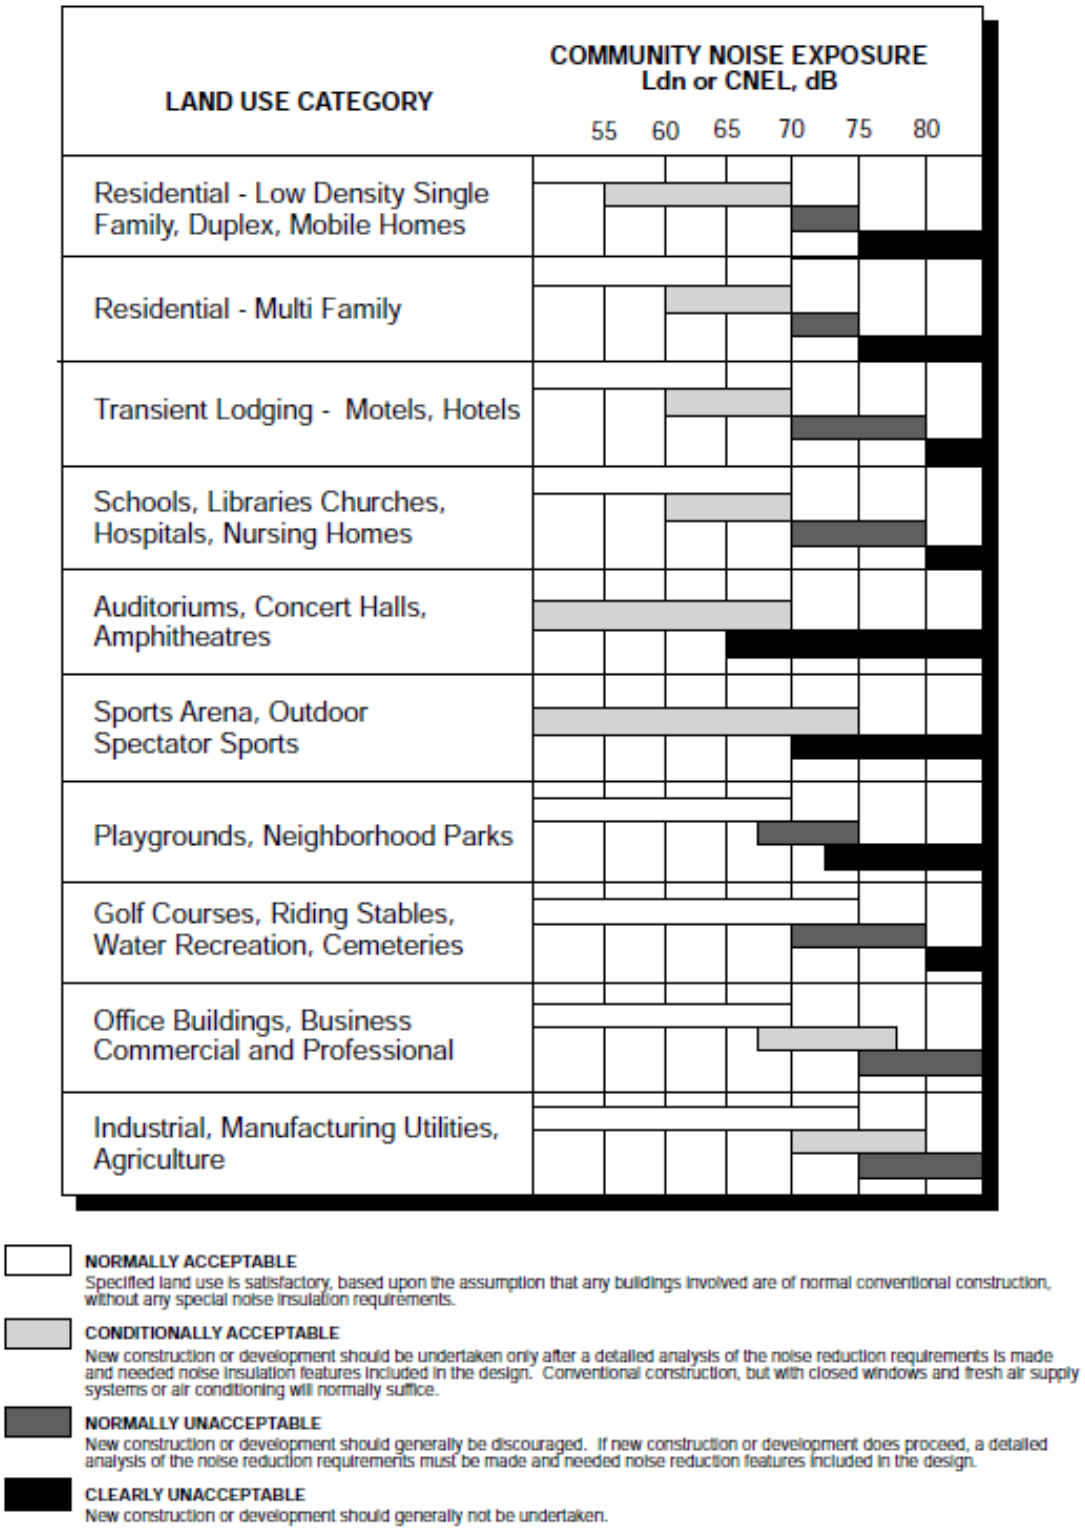
Noise Exposure	Land Use Standard
Above 75 CNEL	All land in this category should be under airport ownership and control.
CNEL 65-74	Soundproof (insulate) existing residences, schools, and other noise sensitive development to achieve interior noise levels of CNEL 45 or below. Require adequate sound insulation for all new residential and other noise sensitive development in areas exposed to noise levels from CNEL 65-69. Avoid areas exposed to noise levels above CNEL 70 for new residential or noise sensitive development unless abated.
CNEL 60-64	Require acoustical studies of proposed new residential and other noise sensitive development. Require sound insulation as necessary to achieve interior noise levels of CNEL 45 or below.

Goal c. Encourage quiet neighborhoods.

Goal d: Allow new construction only where existing or projected noise levels are acceptable or can be mitigated.

- ***Policy d.1:*** The City can require noise mitigations to reduce interior noise levels to an acceptable level. Table 5 (Table 9 in the City's General Plan) establishes the land use compatibility standards for new development.
- ***Policy d.2:*** Limit hours of noise generating construction activities. Include this requirement as a condition of project approval.

Table 5 - Land Use and Noise Compatibility Standards



With reference to the above land use and noise compatibility standards, off-site traffic noise exposure increases resulting from the Proposed Project along road segments located in the City would be subject to these exterior noise level criteria.

The City of Monterey Municipal Code Section 38-111 (A) identifies performance standards to be applied to all use classification in all zoning districts (City of Monterey 2017). Decibel levels are required to be compatible with neighboring uses, and no use shall create ambient noise levels which exceed the standards identified in Table 6. It should be noted that the Community Development Director may require an acoustic study for any proposed project that could have, or create, a noise exposure greater than that identified in the table. It should be noted the Airport is not within the City boundary, and therefore the noise standards identified in Table 6 would not be applicable to on-field operational noise of the airport facility.

Table 6
City of Monterey Maximum Noise Standards

Zone of Property Receiving Noise	Maximum Noise Level (dBA)
OS - Open Space District	60
R - Residential Districts	60
PS - Public and Semi-Public District	60
C - Commercial District	65
I - Industrial Districts	70
PD - Planned Development	Study Required

Notes: These noise standards shall be modified as follows to account for the effects of time and duration on the impact of noise levels: In R districts, the noise standard shall be 5 dB lower between 10:00 p.m. and 7:00 a.m.; noise that is produced for no more than a cumulative period of five minutes in any hour may exceed the standards above by 5 dB; and noise that is produced for no more than a cumulative period of one minute in any hour may exceed the standards above by 10 dB.
Source: City of Monterey 2017.

Section 38-112.2 of the City's Municipal Code (2017) limits the hours of construction for activities authorized by a building permit to the following: Monday through Friday between the hours of 7:00 a.m. and 7:00 p.m., on Saturday between 8:00 a.m. and 6:00 p.m., and on Sunday between 10:00 a.m. and 5:00 p.m. Pursuant to this section, a permit may be issued by the Zoning Administrator for requests to conduct construction activity outside listed hours for unique circumstances.

These regulations are presented primarily for informational purposes and to add context to the noise level analyses. However, noise from activities within the airport property (including construction) are not subject to these local regulations.

City of Del Rey Oaks

General Plan Noise Element

The General Plan Noise Element of Del Rey Oaks includes policy N-4 which clearly states impact level criteria:

> N-4 Noise/land use compatibility shall be considered impacted if exposed to noise levels on the exterior of a building that exceeds 65 dB, and on the interior of a building exceeds 45 dBA*
>
> N-6 The City will work with Monterey Peninsula Airport District to minimize impacts of proposed increase in airport operations and changes in different types of aircraft will not be supported by the City.

With reference to the above exterior noise exposure criterion, off-site traffic noise exposure increases resulting from the Proposed Project along road segments located in the City of Del Rey Oaks would be subject to these exterior noise level criteria.

Municipal Code

The City of Del Rey Oaks Municipal Code includes 8.20 Noise Control (City of Del Rey Oaks 1995). Relevant excerpts are reproduced below:

> 3. Excessive, unnecessary or unusually loud operation or use of hammers, hand powered saws, or similar implements; impact wrenches or similar equipment powered by compressed air, tolls or pieces of equipment powered by an internal combustion engine, such as but not limited to chain saws, blowers, lawn, mowers, electrically powered tools or equipment such as but not limited to saws drills, latches or routers before 7:00 a.m. or after 7:00 p.m. daily.
>
> C. Exemptions: Excessive, unnecessary or unusually loud noise as used in this chapter does not include noise or sound generated by the following:
>
> 1. Cries for emergency assistance and warning calls;
>
> 2. Radio, sirens, horns, and bells on police, fire and other emergency response vehicles;
>
> 3. Special events for which a permit has been obtained from the city are exempted; provided, there is compliance with all conditions which have been noted in writing on the permit. Excessive, unnecessary or unusually

loud noise produced as a result of noncompliance with any condition specified on the permit is not exempt from requirements of this chapter,

4. Activities on or in publicly owned property and facilities, or by public employees or their franchisees, while in the authorities discharge of their responsibilities, are exempt' provided that such activities have been authorized by the owner of such property or facilities or its agent or aby the employing authority;

These regulations are presented primarily for informational purposes and to add context to the noise level analyses. Noise from activities within the airport property (including construction) are not subject to these local regulations.

Vibration Standards

Numerous public and private organizations and governing bodies have provided guidelines to assist in the analysis of groundborne noise and vibration. To date, the City of Monterey has not adopted a threshold for ground-borne vibration impacts. The County of Monterey mentions a pre-construction vibration study in Policy S-7.8. Beyond this policy, the Department of Transportation (Caltrans) has adopted vibration standards to evaluate potential impacts related to construction activities. Information from Caltrans indicates that continuous vibrations with a peak particle velocity of approximately 0.1 inches/second begin to cause annoyance. For purposes of this analysis, the Caltrans threshold of 0.1 inches/second is used to evaluate the vibrational construction-related and operational impacts of the Proposed Project. For engineered concrete and masonry buildings, 0.3 inches/second PPV is a limit where building damage is possible. For non-engineered timber and masonry building, the building damage vibration limit is 0.2 inches/second PPV (Caltrans 2004). Hence, the use of the 0.1 inches/second vibration annoyance threshold is also meant to be very conservative in avoiding damage to existing structures in the Proposed Project vicinity.

3.3 Federal Standards

The EPA has set forth guidelines regarding noise levels identified as a requisite to protect public health and welfare related to noise in its document entitled "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety". This document provides 24-hour exposure limits to protect against hearing loss as 70 dB Leq (24), and also specifies indoor residential activity not be exposed to greater than L_{dn} of 45 dBA (EPA 1974).

In order to determine a significant increase in noise exposure from the traffic, the Federal Interagency Committee on Noise (FICON) has recommendations based on existing ambient sound levels without a project. The FICON studies assessed the annoyance effects of changes in ambient noise levels resulting from aircraft operations. The 2000 FICON findings provide some guidance as to the significance of changes in ambient noise levels due to transportation noise sources. The FICON recommendations are based on studies that relate aircraft and traffic noise levels to the percentage of persons highly annoyed by the noise. Annoyance is a measure of the general adverse reaction of people to noise that interferes with speech and conversation, sleep, or the desire for a tranquil environment.

The rationale for the FICON recommendations is that it is possible to consistently describe the annoyance of people exposed to transportation noise in terms of L_{dn}. The changes in noise exposure relative to existing noise levels are considered to be changes that are sufficient to cause annoyance and potentially to interfere with normal activities at sensitive land uses. Although the FICON recommendations were specifically developed to address aircraft noise impacts, they are also used for traffic noise analyses.

As shown in Table 7, an increase in noise from similar sources of 5 dBA or more would be noticeable where the ambient level is less than 60 dBA. Where the ambient level is between 60 and 65 dBA, an increase in noise of 3 dBA or more would be noticeable, and an increase of 1.5 dBA or more would be noticeable where the ambient noise level exceeds 65 dBA L_{dn}.

Table 7
Significance of Changes in Noise Exposure

Ambient Noise Level without Project	Increase Required for Significant Impact
< 60 dB	+5.0 dB or more
60-65 dB	+3.0 dB or more
> 65 dB	+1.5 dB or more

Source: (FICON, 2000)

Federal Transit Administration and Federal Railroad Administration Standards

Although the FTA standards are intended for federally funded mass transit projects, the impact assessment procedures and criteria included in the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual (FTA 2006) are routinely used for projects evaluated by local jurisdictions. The FTA and Federal Railroad Administration (FRA) have published guidelines for assessing the impacts of ground-borne vibration associated with rail projects, which have been applied by other jurisdictions to other types of projects. The FTA construction vibration damage criterion for conventional structures is 0.2 inch/second peak particle velocity (PPV).

4 SIGNIFICANCE CRITERIA

Based on the criteria identified in Appendix G of the CEQA Guidelines, the Proposed Project would have a significant impact on noise if it would result in:

1. The exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
2. The exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
3. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
4. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;
5. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels; or
6. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels.

Significance Thresholds Applied to Project

Regarding Significance Threshold 1, a significant impact would occur if the Proposed Project would expose multifamily residences to traffic noise greater than 65 dBA CNEL. For single family homes, a significant impact would occur if traffic noise levels exceed 60 dBA CNEL. Up to 70 dBA CNEL traffic noise levels remain conditionally acceptable at residential areas, and conventional construction will normally suffice to achieve compliance with the interior standard of 45 dBA CNEL, with closed windows and fresh air supply systems or air conditioning. Proposed Project traffic noise levels greater than 70 dBA CNEL would produce a significant impact on residential areas in the City and County of Monterey. In the City of Del Rey Oaks, exterior levels of 65 dBA CNEL or greater as a result of existing plus Project-generated traffic would be considered a significant impact.

Regarding Significance Threshold 2, a significant impact would occur if the Proposed Project generates construction-related vibration that exceeds 0.1 inches/second PPV at existing residences in the Proposed Project vicinity. There are no operational concerns related to vibration or groundborne noise because no large impact or rotating equipment is planned for the site.

Regarding Significance Threshold 3, a significant noise impact would occur if Proposed Project-generated trip additions to the area roadway network were to cause a 3 dBA CNEL or greater increase over ambient traffic noise levels without the Proposed Project.

Regarding Significance Threshold 4, a significant temporary construction noise impact would occur if construction is occurring in the overnight period and produces noise levels exceeding 86 dBA L_{max} at 50 feet from job site activities from 9:00 p.m. to 6:00 a.m. (Caltrans 2011).

Regarding Significance Thresholds 5 and 6, this report specifically focuses on traffic noise impacts related to the Proposed Project.

5 METHODOLOGY

Ambient noise measurements were conducted to quantify the existing daytime noise environment at locations in the Proposed Project vicinity. Both short and long-term measurements were conducted. The short-term measurements were used to calibrate the traffic noise model. The long-term measurements were used to calculate existing CNEL in the Proposed Project vicinity.

The noise levels associated with roadway traffic were determined based on data obtained from the traffic impact report (Mott MacDonald 2018) for the Proposed Project. Datakustic's CadnaA sound modeling software was used to model the traffic noise that would result from the roadway traffic volumes identified in the Mott MacDonald report. CadnaA software includes traffic noise modeling algorithms based on the Federal Highway Administration's Traffic Noise Model (TNM), Version 2.5 (FHWA 2004) software. Field noise measurements and corresponding manual traffic counts were used to calibrate the model to ensure model assumptions and inputs accurately reflect existing conditions, and that the model will reliably calculate traffic noise levels from predicted future traffic volumes.

Noise levels resulting from the proposed construction activities have been calculated using the Federal Highway Administration (FHWA) Roadway Construction Noise Modeling software (FHWA 2008). Noise levels from proposed construction traffic routes are also assessed using CadnaA. Similar traffic noise results are presented.

INTENTIONALLY LEFT BLANK

6 EXISTING CONDITIONS

The ambient noise in the Proposed Project vicinity is dominated by road traffic and airport operations. To address the existing noise environment of the Proposed Project vicinity, noise measurements were conducted in the vicinity of the Proposed Project site. Details and results of those measurements are discussed in the following section. Following the measurement discussion, a brief summary of existing traffic noise modeling results is included.

6.1 Ambient Noise Monitoring

General ambient and traffic noise measurements were conducted at the site to determine the existing noise levels in the Proposed Project vicinity. The measurements were conducted by Christopher Barnobi, of Dudek, using a Rion NL-62 sound level meter. This sound level meter meets the current American National Standards Institute standard for a Type 1 Precision sound level meter. The sound level meter was positioned on a tripod at a height of approximately five feet above the ground and fitted with a windscreen during measurements. The instrument was calibrated prior to measurements.

The short-term noise measurements were conducted on March 6 and 7, 2018. All traffic noise measurements were 15 minutes long. The measured average noise levels and the concurrent traffic volumes are presented in Table 8.

Table 8
Measured Noise Levels and Traffic Volumes

Site	Location: Noise Sources Observed	Start Time	L_{eq}[1] (dBA)	Cars	MT[2]	HT[3]	B/M[4]
ST1	Euclid Avenue: Traffic, Birds, Distant Kids Playing, Distant Traffic, 3 feet from the edge of the pavement	3/6/2018 15:29	56.8	30	2	0	0
ST2	Airport Road/ Euclid Avenue: Traffic, Birds, distant Industrial, rustling Leaves, 3 feet from the Edge Of Pavement	3/6/2018 15:54	61.5	60	10	0	1
ST3	Canyon Del Rey Boulevard: Traffic, Birds, distant Aircraft, 15 feet from the Edge Of Pavement	3/6/2018 16:22	69.7	249	11	0	2
ST4	Fremont: Traffic, 3 feet from the Edge Of Pavement	3/7/2018 15:45	70.8	386	13	0	4/2
ST5	Garden Road: Traffic, Distant Aircraft, 10 feet from the Edge Of Pavement	3/7/2018 16:20	66.5	91	11	2	0

Notes:
1 Equivalent Continuous Sound Level (Time-Average Sound Level)
2 Medium Trucks
3 Heavy Trucks
4 Buses or Motorcycles depending on location

Despite focusing on traffic noise, the measurements also included aircraft flyovers and other common noise sources. The measured sound levels were as high as 70.8 dBA L_{eq} at ST4. The lowest short-term sound level measured was 56.8 dBA L_{eq} at ST1.

The long-term measurements were completed using four SoftDB Model Piccolo sound level meters, which were field calibrated prior to each measurement. The Piccolo sound level meters meet the ANSI standard for a Type 2 general purpose sound level meter. The meters collected hourly measurements across a 24-hour period on Wednesday March 7, 2018, and Thursday March 8, 2018. The monitor at LT2 only collected data for part of the 24 hours, but the data appears to be consistent with the data from the other monitors. Results are shown in Table 9 and on Figure 2.

Table 9
Long-Term Measurement Results

Location	Daytime	Nighttime	Ldn	CNEL
	(dBA)			
LT1	51	45	53	53
LT2	48	43	51	52
LT3	51	45	53	53
LT4	57	48	58	58

CNEL and L_{dn} calculated from measured hourly average noise levels ranges from 51 to 58 dBA.

Appendix B includes an Hourly L_{eq} Time History Plot. All monitoring locations show hourly Leq levels below 45 dBA between the late night / early morning hours of midnight to about 5:00 a.m. LT4 located along Ramona Avenue generally has the highest measured hourly Leq.

6.2 Noise Modeling

The CadnaA noise modeling software was used to model noise generated by existing and future traffic along vicinity roadways. The road alignments, the number and types of vehicles on the roadway, vehicle speeds, receiver locations, and other data were input into the noise model. The data are based on the sound level measurements, vicinity GIS data, and Proposed Project plans.

Based on sound level measurement results and traffic counts, the traffic noise model was calibrated to within approximately 3 dB of the measured results. Traffic speeds were the primary parameter altered during the calibration process. A CadnaA default local road vehicle mix (i.e., percentage of cars, trucks, and motorcycles) was used for local roads.

6.3 Traffic Noise Modeling – Current Conditions

The existing CNEL along major roadways was modeled to establish existing traffic noise levels (Figure 3). The CNEL values in Table 10 were modeled in CadnaA for existing roadway traffic volumes based on Average Daily Traffic (ADT) for the existing traffic scenario and are therefore different than the dBA L_{eq} values measured for each roadway in the field (and presented in Table 8). The measured L_{eq} values reflect actual traffic occurring during the short-term measurement, which is used to calibrate the model; the 24-hour noise level (CNEL) associated with existing traffic on a daily basis is then calculated using the calibrated model. The modeled receiver locations (indicated by M#) were set at certain distances from the road to match the distance from the road to the closest residential building façade.

Table 10
Calculated Existing Community Noise Equivalent Level (CNEL)
Associated with Local Roadways

Figure Indicator	Noise Modeling Location	Calculated CNEL (dBA)
M1	Hammond Road Residence (County of Monterey)	53
M2	Oak Crest Circle Residence (County of Monterey)	59
M3	Vista Monterra (County of Monterey)	42
M4	Blue Larkspur Lane (County of Monterey)	57
M5	Boots (County of Monterey)	59
M6	Capote Drive (County of Monterey)	62
M7	Espada Drive (County of Monterey)	53
M8	Corral De Tierra Residence (County of Monterey)	47
M9	Airport Rd Residence (City of Monterey)	57
M10	Airport Road Curve (City of Monterey)	53
M11	Lerwick Drive (City of Monterey)	50
M12	Airport Near Euclid (City of Monterey)	49
M13	Quail Run Court (City of Del Rey Oaks)	54
M14	Los Encinos Drive (City of Del Rey Oaks)	57
M15	Angelus Way (City of Del Rey Oaks)	59
M16	Ramona Avenue (City of Monterey)	49
M17	Oak Tree Lane (County of Monterey)	48
M18	Pheasant Ridge Road (City of Del Rey Oaks)	47
M19	Rosita Road (City of Del Rey Oaks)	42

Based upon the calculated/modeled CNEL values presented in Table 10, one existing residential lot (M6) has existing calculated traffic noise exposure greater than the normally acceptable range (of 60 dBA CNEL).

6.4 Airport Noise

Noise impacts from aircraft operations related to the Airport are assessed in a separate appendix to the EIR.

7 PROPOSED PROJECT IMPACT ANALYSIS AND MITIGATION

Under the Proposed Project, the Project site will primarily be affected by aircraft and traffic noise as well as emergency vehicle noise. The Proposed Project will also generate traffic trips, resulting in potential increases in traffic noise along vicinity roadways. Finally, construction of the Proposed Project would generate temporary (short-term) construction noise, which could affect noise-sensitive uses in the Proposed Project vicinity. Each of these potential impacts is discussed below.

7.1 Traffic Noise

Traffic data was taken from research conducted for the *Monterey Regional Airport Environmental Impact Report Traffic Impact Analysis* (TIA) (Mott MacDonald 2018) regarding average daily traffic (ADT) volumes existing on the vicinity roadway network, as well as for traffic forecasts addressing a number of future roadway traffic scenarios.

ADT volumes for segments not directly analyzed in the TIA were derived from intersection volumes immediately adjacent to analyzed segments. Specifically, ADT was derived utilizing an assumption that ADT corresponds to 10% of traffic that occurs during the PM peak hour period and adjusted to create a 24-hour segment count. Proposed Project traffic was included based on the specified project trip generation and trip distribution specified within the TIA. Table 11 shows the ADT numbers for the analyzed traffic scenarios in the traffic impact analysis.

Notes: ADT = average daily traffic

The ADT values illustrated in Table 11 were used with the calibrated CadnaA traffic noise model to calculate existing and future noise levels along the identified roadway segments without and with the Proposed Project, in order to determine worst-case traffic noise exposure levels for existing noise-sensitive land uses.

7.1.1 Off-Site Noise Impacts Associated with Proposed Project Traffic

The Proposed Project would contribute vehicle trips onto the regional roadway network, particularly onto the major roadways in close proximity to the Proposed Project. To evaluate the change in noise level on area roadways from Proposed Project trip contributions, traffic noise modeling was performed. Modeling of traffic noise focused on existing residential locations along vicinity roads, using the following methodology. First, the distances from the roadway to the closest existing residences located along each roadway segment of concern were determined from aerial photographs. Some of these existing residential areas include existing landscaping or small fences along the roadway. Next, current traffic volume data (on an average daily trip basis) for each segment was entered into the model. The same evaluation was then performed using the "Existing Plus Project" traffic volumes. The results are presented in Table 12.

Table 12
Short-term Proposed Project Contribution to Off-Site Traffic Noise
(Off-Site Traffic Noise Level Increase)

Roadway (segment)	CNEL (dB)		
	Existing	*Existing + Project*	*dB Change*
County of Monterey			
M1 Hammond Road Residence	53	53	0
M2 Oak Crest Circle Residence	59	59	0
M3 Vista Monterra	42	42	0
M4 Blue Larkspur Lane	57	57	0
M5 Boots	59	59	0
M6 Capote Drive	62	62	0
M7 Espada Drive	53	53	0
M8 Corral De Tierra Residence	47	47	0
M17 Oak Tree Lane	48	48	0.3
City of Monterey			
M9 Airport Rd Residence	57	57	0.1
M10 Airport Road Curve	53	53	0.3
M11 Lerwick Drive,	50	50	0.1
M12 Airport Near Euclid	49	50	0.9
M16 Ramona Avenue	49	49	0
City of Del Rey Oaks			
M13 Quail Run Court	54	54	0
M14 Los Encinos Drive	57	57	0.1
M15 Angelus Way	59	59	0
M18 Pheasant Ridge Road	47	47	0.7
M19 Rosita Road	42	42	0

Based upon existing roadway traffic volumes compared to "existing plus project" roadway traffic volumes, the addition of Proposed Project traffic to the roadway network would result in an increase of less than 1 dBA CNEL at existing residences along the examined roadway segments (which is below the discernible level of change for the average human ear as discussed in the Human Response to Changes in Noise Levels section). Thus, a less than significant impact is expected for Proposed Project-related off-site traffic noise increases affecting existing residences in the vicinity.

None of the modeled off-site receptors would experience noise traffic levels that increase from below 65 dBA CNEL to greater than 65 dBA CNEL, comparing the Existing to the Existing plus Project traffic scenarios. Since the most-restrictive limit of acceptable exterior noise exposure for

residences in the vicinity of the Proposed Project is 65 dBA CNEL (applicable in Del Rey Oaks), Proposed Project-related traffic noise increases would not cause traffic noise exposure at existing residences to exceed an established standard. Proposed Project-specific traffic noise impacts would therefore be less than significant.

A new "north side" road would be constructed as part of the Proposed Project. This road has the potential to impact residences near the proposed road alignment. M18 and M19 represent residential locations where the predicted exterior noise exposure level from the new "north side" road would be the greatest. The noise level increases due to Proposed Project-related traffic at these locations would be less than 1 dB. Thus, a less than significant impact is expected for Proposed Project-related off-site traffic noise increases affecting existing residences associated with the "north side" road.

7.1.2 Cumulative Noise Impacts Associated with Proposed Project Traffic

The Proposed Project's contributions to long-term traffic noise levels on the roadway network are considered in this section. Table 13 shows the modeling results for the Cumulative Condition (including projected growth in enplanements) and Cumulative Plus Project Long-Term traffic scenarios.

Table 13
Long-term Proposed Project Contribution to Cumulative Off-Site Traffic Noise (Off-Site Traffic Noise Level Increase)

Roadway (segment)	CNEL (dB)			
	Existing	*Cumulative (including projected growth in enplanements)*	*Cumulative + Project, Long-Term*	*dB Change from Existing to Cumulative + Project*
County of Monterey				
M1 Hammond Road Residence, City of Monterey	53	53	54	0.6
M2 Oak Crest Circle Residence	59	59	60	0.6
M3 Vista Monterra	42	42	43	0.7
M4 Blue Larkspur Lane	57	57	58	0.9
M5 Boots	59	59	60	1.1
M6 Capote Drive, City of Del Rey Oaks	62	63	63	1
M7 Espada Drive	53	53	54	1
M8 Corral De Tierra Residence	47	48	48	1
M17 Oak Tree Lane	48	49	49	1.2
City of Monterey				
M9 Airport Rd Residence	57	58	58	1.6
M10 Airport Road Curve	53	54	54	1.7

Table 13
Long-term Proposed Project Contribution to Cumulative Off-Site Traffic Noise
(Off-Site Traffic Noise Level Increase)

Roadway (segment)	CNEL (dB)			
	Existing	*Cumulative (including projected growth in enplanements)*	*Cumulative + Project, Long-Term*	*dB Change from Existing to Cumulative + Project*
M11 Lerwick Drive,	50	51	51	1.6
M12 Airport Near Euclid	49	51	51	2.2
M16 Ramona Avenue	49	51	51	1.5
City of Del Rey Oaks				
M13 Quail Run Court	54	55	5	1.4
M14 Los Encinos Drive	57	58	58	1.5
M15 Angelus Way	59	60	61	1.4
M18 Pheasant Ridge Road	47	48	49	2.1
M19 Rosita Road	46	46	47	0.1

Comparing Existing Condition and Cumulative Plus Project scenarios, the Proposed Project's contribution to overall traffic on the vicinity roadways is expected to be less than 3 dB CNEL. This change in noise levels is less than the threshold of perception outside of a carefully controlled acoustic laboratory environment. With a less than perceptible increase in Cumulative traffic noise levels for vicinity residences, the Proposed Project would not have a substantial contribution to a cumulatively significant noise impact.

None of the modeled off-site receptors would experience noise traffic levels that increase from below 65 dBA CNEL to greater than 65 dBA CNEL, comparing the Existing Condition to the Cumulative with Project traffic scenarios. Since the most-restrictive limit of acceptable exterior noise exposure for residences in the vicinity of the Proposed Project is 65 dBA CNEL (applicable in Del Rey Oaks), Proposed Project-related traffic noise increases would not cause traffic noise exposure at existing residences to exceed an established standard.

7.2 Construction Noise

7.2.1 Construction Equipment Noise Levels

Construction noise is a temporary phenomenon. Construction noise levels will vary from hour to hour and day to day, depending on the equipment in use, the operations being performed, and the distance between the source and receptor.

Construction is expected to include demolition, site preparation, grading, paving, building construction, and architectural coating. Construction equipment with substantially higher noise-generation characteristics (such as pile drivers, rock drills, blasting equipment) would not be necessary.

The Federal Highway Administration (FHWA) has developed the 2006 (RCNM) software, which can be used to evaluate construction noise from any major construction proposal. RCNM contains a large database of construction equipment, including noise generation level and load factor (percentage of time each piece of equipment is active on a typical construction site). Dudek used RCNM to assess construction noise impacts of the Proposed Project.

Construction noise is difficult to quantify because of the many variables involved, including the specific equipment types, size of equipment used, percentage of time in use, condition of each piece of equipment, and number of pieces of equipment that will actually operate on site. The construction vehicle assemblage would include standard equipment such as dozers, tractors, loaders, backhoes, excavators, graders, scrapers, trenchers, lifts, paving equipment, rollers, compressors, and miscellaneous trucks. Specified and measured noise level ranges for various pieces of construction equipment at a distance of 50 feet are presented in Table 14. The noise values presented are used as reference noise data for respective equipment in RCNM. The construction equipment is expected to be spread out, with some equipment occasionally operating along the perimeter of the site while most of the time the equipment is expected to be operating near the major improvement areas.

7.2.2 Construction Schedule

Table 15 shows the proposed construction activities with phase years and location (North side or South side of the Airport).

Table 15
Short-term Proposed Project Construction Activities

Construction Phase	Construction Activity on North or South Side of Airport	Years per Phase	Description of Construction Activity
Phase 1 (2019-2021)	North	3	General Aviation (GA) Prep/Install hangars; temporary Airport Rescue & Firefighting (ARFF) building
Phase 2 (2022-2026)	South	5	Demo South GA & ARFF; grade and construct terminal, apron, roads, rental car lot; construct terminal parking garage. Repair haul road.
Phase 3 (2027)	South	1	Demolish old terminal; construct new ARFF
Phase 4 (2028)	South	1	Restripe TW A & move hold lines; Construct surface lot/garage along Fred Kane Dr.
Phase 5 (2029)	North	1	Construct "north side" road
Phase 5 (2029)	South		Construct Highway 68 frontage loop road
Total		**11**	

7.2.3 Construction Traffic Noise

Exhibit 2 shows proposed construction vehicle haul routes. Construction vehicles are proposed to travel along Airport Road through the Casanova Oak Knoll (CONA) neighborhood to reach Fremont Street until a future "north side" road is constructed.

Exhibit 2. Proposed Project Construction Vehicle Routes

Table 16
Short-term Proposed Project Construction Trips as a Percentage of Existing Average Daily Traffic (ADT)

Construction Phase	Total Daily Construction Trips (PCE)	Construction Activity Area	Proposed Project Haul Routes	Existing ADT	Construction Trips % of ADT
1	26	North	Airport Rd	2,400	1.1%
1	26	North	Fremont St	19,000	0.1%
2	40	South	Olmsted Rd	5,800	0.7%
2	40	South	Highway 68	18,800	0.2%
3	12	South	Olmsted Rd	5,800	0.2%
3	12	South	Highway 68	18,800	0.1%
4	74	South	Olmsted Rd	5,800	1.3%
4	74	South	Highway 68	18,800	0.4%
5	34	North	Airport Rd	2,400	1.4%
5	34	North	Fremont St	19,000	0.2%
5	24	South	Olmsted Rd	5,800	0.4%
5	24	South	Highway 68	18,800	0.1%

Notes:

1. Total Daily Construction Trips (PCE) includes trips by construction workers and truck trips, with truck trips converted to Passenger Car Equivalents (PCE).
2. Construction Activity Area refers to construction activities on the north and south sides of the Airport.
3. Haul routes include roads closest to the project site that would be most affected by construction vehicle trips. Construction vehicles trips would disperse onto other roads as they move farther from the project site, reducing the potential for construction traffic impacts.
4. The haul routes and construction phases where construction-related trips would represent more than 1% of existing daily traffic are shaded in red.

As shown in Table 16, construction traffic is expected to increase the average daily traffic by less than 2% in all construction phases. To increase traffic noise levels by 3 dB, a doubling of existing daily traffic is required. With less than a 2% increase in average daily traffic due to construction traffic, the traffic noise increase due to the construction traffic is expected to be less than 3 dB. The expected traffic noise increase is therefore below the discernible level of change for the average human ear as discussed in the Human Response to Changes in Noise Levels section (Caltrans 2013). Thus, a less than significant impact is expected for Proposed Project-related off-site construction traffic noise increases affecting existing residences in the vicinity.

7.2.4 Airport (On-Site) Construction Noise

Phase 1 of construction of the Proposed Project is expected to commence in 2019 and then continue over a 3-year period, with expected completion in 2021. This work is specific to the north side of the Airport. Phase 1 includes preparing and installing general aviation hangers. Phase 1 would also include the construction of a temporary Airport Rescue and Firefighting (ARFF) building. The closest residential receptors are located on Rosita Road, 650 feet from the construction activities. Typical construction distances for most sensitive receptors would be at least 1,000 feet during construction activities.

There will be a period where Phases 2, 3, and 4 occur on the south side of the Airport from 2022 to 2028. Construction operations on the south side of the Airport will be 2,000 to 3,000 feet further away from residential noise sensitive receptors located on the north side of the airport. This additional distance dramatically reduces the potential for construction noise impacts such that the impacts associated with the south side construction projects are considered less than significant for residential receivers on the north side of the Airport.

On the south side of the airport, two churches, a hotel, and some lower density residential buildings exist. The Shoreline Community Church and Believers Church International are located on Garden Road. The churches would be located about 1,000 feet west of Phase 2 construction areas and 750 feet from Phase 3 and 4 construction areas. The hotel would be about 250 feet from frontage road construction and over 300 feet from other construction activities. The closest residence (south of SR 68 and west of Olmstead Road) would be about 650 feet from frontage road construction and about 1,000 feet from main areas of construction. Other residences exist in this area, but are located further from proposed construction areas.

Phase 2 would include earth movement from the south side of the Airport to the north side disposal areas. Vehicles would be using the service road during the day and may travel directly across the runway during late night construction. For this phase, operations on the north side of the Airport are expected to be short in duration and intermittent since earth will be unloaded on the north side.

In 2029, Phase 5 would return to the North side of the Airport. During this phase, North Side Road will be constructed. Also during this phase, on the south side of the Airport, a Highway 68 frontage road would be constructed. The frontage road construction efforts would be located about 1,000 feet from the churches on Garden Road and about 2,000 feet east of Calvary Chapel.

Table 17 shows the expected equipment use by phase for the construction phases of the Proposed Project.

Table 17
Short-term Typical Construction Equipment for Construction

Construction Phase Name	Equipment	Number of pieces of Equipment
Phase 1: Building Construction	Cranes	1
	Forklifts	3
	Generator Sets	1
	Tractors/Loaders/Backhoes	3
	Trenchers	1
	Welders	1

	Dozer	1
	Scraper	2
	Backhoes	2
Phase 5: Paving for Circulation Improvements (North Side)	Pavers	2
	Paving Equipment	2
	Rollers	2

The magnitude of the impact would depend on the type of construction activity, equipment, duration of the construction phase, distance between the noise source and receiver, and any intervening structures. The typical operating cycles for construction equipment involve one or two minutes of full power operation followed by three or four minutes at lower power settings. Noise from construction equipment generally exhibits point source acoustical characteristics. A point source sound is attenuated (is reduced) at a rate of 6 decibels per doubling of distance from the source for "hard site" conditions and at 7.5 decibels per doubling of distance for "soft site" conditions. A hard site is characterized by ground surface covered by pavement, or hard compacted soils; a soft site is characterized by ground covered with vegetation, or loose soil with a rough surface (such as tilled land). These rules apply to the propagation of sound waves with no obstacles between source and receivers, such as topography (ridges or berms) or structures (FTA 2006).

Table 18 shows the calculated noise levels at nearby noise-sensitive receptors during construction phases for the Proposed Project. The results are from the RCNM software and based on construction equipment defaults assumed for the Proposed Project based on the phase description. The noise levels shown in Table 18 take into account operation of multiple pieces of construction equipment simultaneously for the L_{eq} results. More details from the RCNM analysis can be found in Appendix C. These noise levels are based on surveys conducted by the United States Environmental Protection Agency in 1971. In the time since 1971, regulations have been enforced to improve noise generated by certain types of construction equipment to meet worker noise exposure standards. Also because of stringent air quality emissions standards, newer, cleaner, and quieter heavy equipment is used on most construction projects in California. Thus, construction phase noise levels indicated in Table 18 represent a conservative estimate of anticipated equipment noise. L_{max} levels are focused on the single piece of equipment with the highest L_{max}. These L_{max} results do not account for multiple pieces of equipment producing maximum levels at the same time, since this is an unlikely occurrence. Because construction phases typically include multiple pieces of equipment operating simultaneously, the calculated L_{eq} levels can be higher than the L_{max} for an individual piece of equipment.

Table 18
RCNM Results Summary

Case Description	Noise Sensitive Receptor Levels		
	Lmax (dBA)	*Leq (dBA)*	*Exceeds 86 dBA L_{max} at 50 feet*
Phase 1: Building Construction 650' from Rosita Rd. Residences	58	61	No
Phase 1: Architectural Coating 650' from Rosita Rd. Residences	55	51	No
Phase 2: Earth Movement On North	64	71	No

Table 18
RCNM Results Summary

Case Description	Noise Sensitive Receptor Levels		
	Lmax (dBA)	*Leq (dBA)*	*Exceeds 86 dBA L_{max} at 50 feet*
Side of Airport 200' from Rosita Rd. Residences			
Phase 2: Demolition, Grading, and Construction on South Side of Airport at Hotel 300'	69	74	No
Phase 2: Demolition, Grading, and Construction on South Side of Airport at Church 1,000'	59	64	No
Phase 3: Demolition and Construction on South Side of Airport at Church 300'	69	73	No
Phase 3: Demolition and Construction on South Side of Airport at Church 750'	62	65	No
Phase 4: Construction of Surface Lot/Garage on South Side of Airport at Church 300'	74	72	No
Phase 4: Construction of Surface Lot/Garage on South Side of Airport at Church 750'	66	64	No
Phase 5: Highway 68 Frontage Road at Hotel 250'	71	73	No
Phase 5: Highway 68 Frontage Road at Church 1000'	59	61	No
Phase 5: Highway 68 Frontage Road at Church 2000'	53	55	No

Case Description	Multifamily Residences Del Rey Gardens Drive				
	Typical 1000'		*Worst Cast 200'*		*Exceeds 86 dBA L_{max} at 50 feet*
	Lmax (dBA)	*Leq (dBA)*	*Lmax (dBA)*	*Leq (dBA)*	
Phase 5: Grading North Side Road	59	61	73	74	No
Phase 5: Paving North Side Road	59	60	73	74	No

North Side Construction Noise Impacts. For Phase 1, the shortest distance between the closest construction activity and neighboring residences would be approximately 650 feet. This distance was used to evaluate construction noise levels at the residences during Phase 1. During Phase 5 (Construction of North Side Road), both worst-case and typical distances are used. The worst-case condition at 200 feet represents when road construction will be closest to the multifamily residential buildings off of Del Rey Gardens Drive. Typical conditions represent noise levels if

construction were being conducted near the center of the Proposed Project work area (i.e., 1,000 feet from the residences).

For Phase 2, the assumed distance from the closest disposal area to the nearest noise sensitive receptors is 200 feet. Since most work during this phase is expected to occur on the south side of the Airport, the L_{eq} is expected to be lower than calculated the 71 dBA for residences on the north side of the Airport as shown in Table 18. It should be noted that the calculated L_{max} of 64 dBA is as much as 20 dB greater than the hourly L_{eq} during the nighttime hours as shown in Appendix B.

As the table shows, the highest noise levels for northern residential receptors are expected to occur during the North Side Road Construction efforts when they are closest to the multifamily residential area near Del Rey Gardens Drive. Construction-related noise levels could reach up to 74 dBA L_{eq} at these multifamily residential areas. While the expected construction L_{eq} would increase the ambient noise levels in the vicinity, the noise levels expected at these residences are not greater than a diesel truck driving at 50 miles per hour about 50 feet away (Caltrans 2013).

South Side Construction Noise Impacts. Phases 2, 3, 4, and 5 occur on the south side of the Airport where the closest noise sensitive receptors include a hotel, churches, and residences. Construction noise levels at the closest noise sensitive receptor, the hotel, are expected to be up to 74 dBA L_{eq}. Calculated construction noise levels at the churches would be up to 65 dBA L_{eq}, which is less than a lawn mower at 100 feet (Caltrans 2013).

The construction activities would be temporary and would conclude with the completion of the Proposed Project. However, some construction activities are expected to occur during nighttime hours when residents are especially sensitive to noise. The final column in the Table 18 indicates if construction equipment anticipated to be used in a specific construction phase would exceed the Caltrans' guideline of no more than 86 dB L_{max} at 50 feet from the source (refer also to Table 14). For example, a concrete saw has an L_{max} of 90 dBA at 50 feet, but is not specifically expected to be used as a primary piece of equipment for any phases. (However, a concrete saw may be necessary for short-term use when concrete removal is conducted, primarily during Phase 2 on the south side). The other pieces of equipment have L_{max} below 86 dBA at 50 feet.

The levels of construction noise anticipated to occur during the Proposed Project are allowed during the daytime hours by both the City of Del Rey Oaks and the City of Monterey. However, during Phase 2, some on-airport construction activities are expected to occur during nighttime hours due to a potential need to close the runway during construction. With at least some of the expected construction activity occurring during nighttime hours, construction operations are considered a Potentially Significant temporary noise impact in the short term.

7.3 Construction Vibration Impact to Off-Site Residences

The heavier pieces of construction equipment used at this site would include dozers, graders, and pavers. Ground-borne vibration information related to construction activities has been collected by the California Department of Transportation (Caltrans) (Caltrans 2004). Based on published vibration data, the anticipated construction equipment would generate a peak particle velocity of approximately 0.09 inch/second or less at a distance of 25 feet (FTA 2006).

Information from Caltrans indicates that continuous vibrations with a peak particle velocity of approximately 0.1 inch/second begin to annoy people. Ground-borne vibration is typically attenuated over short distances. The closest existing residences are located over 200 feet from the areas of major construction and over 1,000 feet from the center of the Proposed Project. At these distances, the peak particle velocity from construction would be below 0.1 inch/second and would also be below the threshold of perceptibility. Therefore, impacts related to vibration from construction activities would **be less than significant.**

INTENTIONALLY LEFT BLANK

8 MITIGATION MEASURES

Traffic noise increases due to the Proposed Project are expected to be **less than significant**, and thus no mitigation is required.

Short-term construction noise impacts are considered **potentially significant** for the existing nearby residences, due to the potential for certain construction activities to be carried out overnight. Consequently, the following mitigation measures are required to address potentially significant night-time construction noise.

Mitigation Measure MM-NOI-1: Nighttime noise-generating construction activities have the potential to create significant impacts. To address these impacts the following mitigation measures are provided:

1. Construction truck hauling operations may proceed through the CONA neighborhood only in the time period from 7 a.m. to 7 p.m. Outside these hours, construction hauling activity shall use a route that does not proceed through the CONA neighborhood.
2. For construction activity occurring within approximately 500 feet of residences, portable noise barriers shall be installed near nighttime construction areas. The locations of the barriers should break the line-of-sight from the construction area(s) to any residential locations visible from the construction area. This may include erection of temporary plywood barriers to create a break in the line-of-sight, or erection of a tent employing sound blanket walls around the stationary noise source(s).
3. Avoid the unnecessary idling of equipment and stage construction equipment as far as reasonable from residences.
4. Notify adjacent uses of the construction schedule.
5. All noise-producing project equipment and vehicles using internal combustion engines shall be equipped with mufflers, air-inlet silencers where appropriate, and any other shrouds, shields, or other noise-reducing features in good operating condition that meet or exceed original factory specification. Mobile or fixed "package" equipment (e.g., arc-welders, air compressors) shall be equipped with shrouds and noise control features that are readily available for that type of equipment.
6. The use of noise-producing signals, including horns, whistles, alarms, and bells, shall be for safety warning purposes only.

INTENTIONALLY LEFT BLANK

9 ALTERNATIVE IMPACT ANALYSIS AND MITIGATION

Comparison of Project Alternatives

There are two alternatives being considered in detail in the EIR: the Proposed Project and Alternative 1. The major difference between the two projects is the location of the permanent ARFF building and the timing of the construction of the "north side" road. Under the Proposed Project, the existing ARFF building would be permanently relocated on the south side of the Airport in the general location of the existing commercial terminal building. Since there would be up to a 6- or 7-year gap between when the existing ARFF building would be demolished and the permanent ARFF building would be constructed, a temporary ARFF building would be necessary. This temporary ARFF building would be installed on the north side GA apron. An on-airport ARFF service road would be constructed to maintain acceptable on-airport emergency response times. However, for off-airport calls, the ARFF emergency vehicles would use existing Airport Road west through the CONA neighborhood since the new "north side" road would not yet be constructed. This would create longer off-airport emergency response times than currently occur.

Under Alternative 1, the existing ARFF building would be permanently relocated to the north GA apron at the same time as the southeast GA hangars and fuel tank are relocated to the north side. The new "north side" road would be constructed, as well as an on-airport ARFF service road, to provide acceptable on- and off-airport emergency response times.

Table 19 compares the phasing of the Safety Enhancement Project between the two alternatives:

Table 19
Comparison of Phasing for the Safety Enhancement Project Proposed Project vs. Alternative 1

Construction Phases	Proposed Project	Alternative 1
Phase 1	Years 1–3: Construct the necessary pavement and infrastructure to relocate approximately 44 GA tenants from the southeast part of the Airport to north of the airfield. Install a temporary ARFF facility on the Navy Flying Club apron.	Years 1–3: Construct the necessary pavement and infrastructure to relocate approximately 44 GA tenants from the southeast part of the Airport to north of the airfield. Concurrent with site preparation for the north side GA area, construct a 24-foot-wide "north side" road that would go from the north GA area to State Route (SR) 218 via a connection with Del Rey Garden Drive. Construct a permanent ARFF building in the general location of the existing Navy Flying Club buildings.

Table 19
Comparison of Phasing for the Safety Enhancement Project Proposed Project vs. Alternative 1

Construction Phases	Proposed Project	Alternative 1
Phase 2	Years 4–8: Demolish the existing ARFF building and demolish or relocate the southeast GA facilities. Construct a new commercial terminal complex (including apron, terminal loop road and roundabout, and vehicular parking lots and garage). Close Taxiway "K" between Runway 10R-28L and Taxiway "A."	Years 4–7: Demolish the existing ARFF building and demolish or relocate southeast GA facilities. Construct a new commercial terminal complex (including apron, terminal loop road and roundabout, and vehicular parking lots). Close Taxiway "K" between Runway 10R-28L and Taxiway "A."
Phase 3	Year 9: Demolish the existing terminal building. Construct a new ARFF building.	Year 8: Remark 1,850-lf portion of Taxiway "A" to 327.5 feet from Runway 10R-28L and relocate taxiway signage and lighting. Remark hold lines on Taxiways "G" and "J" at 250 feet from the Runway 10R-28L centerline. Provide apron islands at Taxiways "G" and "J." Demolish the existing terminal building.
Phase 4	Year 10: Remark 1,850-lf portion of Taxiway "A" to 327.5 feet from Runway 10R-28L and relocate taxiway signage and lighting. Remark hold lines on Taxiways "G" and "J" at 250 feet from the Runway 10R-28L centerline. Provide apron islands at Taxiways "G" and "J." Realign Fred Kane Drive and construct a second parking structure and surface parking lots, as needed.	Year 9: Construct replacement surface parking along Fred Kane Drive.

In addition to the new permanent ARFF building, the Proposed Project and Alternative 1 have differences in the type and amount of vehicular parking proposed for south of the new commercial terminal and along Fred Kane Drive. Under the Proposed Project, there would be a net increase of 669 vehicular parking spaces for the commercial terminal complex in two parking garages and three surface lots. Under Alternative 1, initially, there would be a net increase of 321 vehicular parking spaces for the commercial terminal complex in three surface lots.

Finally, depending on the alternative, a proposed Highway 68 frontage road would also be changed. Under the Proposed Project is the frontage road is planned as a full loop, while under Alternative 1 it is planned as a cul-de-sac to avoid some of the rare plants in the area. The proposed acquisition of a 5.5-acre parcel near the proposed commercial terminal complex would occur under either alternative as would all future long-term projects.

9.1 Project Alternative Traffic Noise

The traffic impact assessment addressed the Proposed Project and Alternative 1 (refer to Section 7.1 Traffic Noise, Table 11). The following sections present results from the traffic noise model using these input traffic data for the Project Alternative 1.

9.1.1 Off-Site Noise Impacts Associated with Project Alternative Traffic

The alternative project would contribute vehicle trips onto the regional roadway network, similar to the Proposed Project. To evaluate the change in noise level on area roadways from alternative project trip contributions, traffic noise modeling was performed.

The results are presented in Table 20.

Table 20
Short-term Project Alternative Contribution to Off-Site Traffic Noise
(Off-Site Traffic Noise Level Increase)

Roadway (segment)	CNEL (dB)		
	Existing	*Existing + Project Alt*	*dB Change*
County of Monterey

Based upon existing roadway traffic data compared to the "existing plus project alternative" data, the addition of Project traffic under Alternative 1 to the roadway network would result in an increase of less than 1 dB at existing residences along the examined roadway segments. This change in traffic noise level is below the discernible level of change for the average human ear as discussed in the Human Response to Changes in Noise Levels section. Thus, a less than significant impact is expected for Alternative 1 project-related off-site traffic noise increases affecting existing residences in the vicinity.

None of the modeled off-site receptors would experience noise traffic levels that increase from below 65 dBA CNEL to greater than 65 dBA CNEL, comparing the Existing to the Existing plus Project Alternative traffic scenarios. Since the most-restrictive limit of acceptable exterior noise exposure for residences in the vicinity of the Project is 65 dBA CNEL (applicable in Del Rey Oaks), project-alternative-related traffic noise increases would not cause traffic noise exposure at existing residences to exceed an established standard. Project-specific traffic noise impacts under Alternative 1 would therefore be less than significant.

9.1.2 Cumulative Noise Impacts Associated with Project Alternative 1 Traffic

The Alternative 1 project contributions to long-term traffic noise levels on the roadway network are considered in this section. Table 21 shows the modeling results for Cumulative Condition (including projected growth in enplanements) and Cumulative Plus Alternative 1 Long-Term traffic scenarios.

Table 21
Long-term Project Alternative 1 Contribution to Cumulative Off-Site Traffic Noise (Off-Site Traffic Noise Level Increase)

Roadway (segment)	CNEL (dB)			
	Existing	*Cumulative (including projected growth in enplanements)*	*Cumulative + Project, Long-Term Alterative 1*	*dB Change from Existing to Cumulative + Project*

M12 Airport Near Euclid	49	51	51	2.2
M16 Ramona Avenue	49	51	51	0
City of Del Rey Oaks				
M13 Quail Run Court	54	55	55	1.4
M14 Los Encinos Drive	57	58	58	1.5
M15 Angelus Way	59	60	61	1.4
M18 Pheasant Ridge Road	47	48	49	2.1
M19 Rosita Road	46	46	47	0.1

Comparing Existing Conditions and Cumulative Plus Project Alternative 1, the Alternative 1 contribution to overall traffic on the vicinity roadways is expected to be less than 3 dB CNEL. This change in noise levels is less than the threshold of perception. With a less than perceptible increase in Cumulative traffic noise levels for vicinity residences, Alternative 1 would not have a substantial contribution to a cumulatively significant noise impact.

None of the modeled off-site receptors would experience noise traffic levels that increase from below 65 dBA CNEL to greater than 65 dBA CNEL, when comparing the Existing Conditions to the Cumulative with project alternative traffic scenarios. Since the most-restrictive limit of acceptable exterior noise exposure for residences in the vicinity of the Project is 65 dBA CNEL (applicable in Del Rey Oaks), project-alternative-related traffic noise increases would not cause traffic noise exposure at existing residences to exceed an established standard.

9.2 Project Alternative Construction Noise

General discussion of construction noise is provided in Section 7.2, Construction Noise. This Project Alternative analysis follows the same methodology as the construction noise analysis presented for the Proposed Project in Section 7.2.

9.2.1 Construction Schedule

Table 22 shows the proposed Project Alternative Construction Activities.

Table 22
Proposed Project Alternative Construction Activities

Table 16. Alternative 1 Project Construction Activities			
Construction Phase	**Construction Activity on North or South Side of Airport**	**Years per Phase**	**Description of Construction Activity**
Phase 1 (2019-2021)	North	3	General Aviation (GA) Prep/Install hangars; Construct new Airport Rescue & Firefighting (ARFF) building; Construct "north side" road
Phase 2 (2022-2025)	South	4	Demo South GA & ARFF; grade and construct terminal, apron, roads, rental car & terminal surface lots. Repair haul road.
Phase 3 (2026)	South	1	Restripe TW A & move hold lines; Demolish old terminal
Phase 4 (2027)	South	1	Construct surface parking along Fred Kane Dr.
Phase 5 (2028)	South	1	Construct Highway 68 frontage cul-de-sac
Total		**10**	

9.2.2 Construction Traffic Noise

Exhibit 3 shows the proposed construction vehicle haul routes. Construction vehicles are proposed to travel along Del Rey Gardens Drive instead of Airport Road.

Exhibit 3. Alternative 1 Project Construction Vehicle Haul Routes

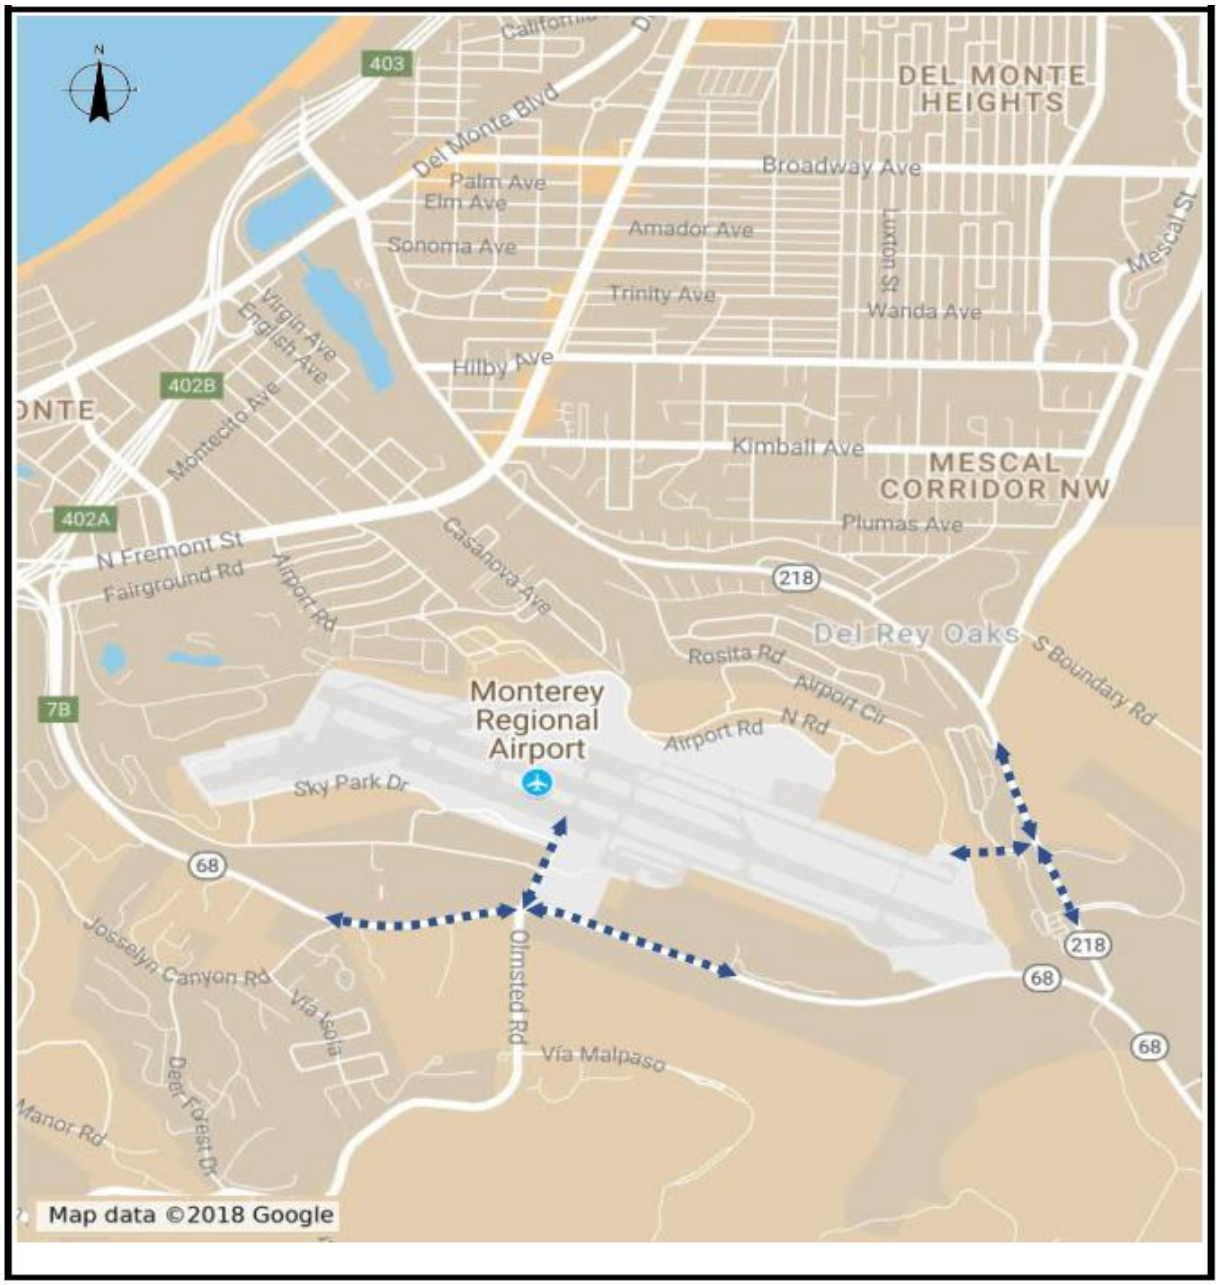

Table 23
Alternative 1 Proposed Project Construction Trips as a Percentage of Existing Average Daily Traffic (ADT)

Construction Phase	Total Daily Construction Trips (PCE)	Construction Activity Area	Alternative 1 Project Haul Routes	Existing ADT	Construction Trips % of ADT
1	38	North	Del Rey Gardens Dr	1,000	3.8%
1	38	North	Highway 218	13,200	0.3%
2	50	South	Olmsted Rd	5,800	0.9%
2	50	South	Highway 68	18,800	0.3%
3	10	South	Olmsted Rd	5,800	0.2%
3	10	South	Highway 68	18,800	0.1%
4	58	South	Olmsted Rd	5,800	1.0%
4	58	South	Highway 68	18,800	0.3%
5	10	South	Olmsted Rd	5,800	0.2%
5	10	South	Highway 68	18,800	0.1%

Notes:

1. Total Daily Construction Trips (PCE) includes trips by construction workers and truck trips, with truck trips converted to Passenger Car Equivalents (PCE).
2. Construction Activity Area refers to construction activities on the north and south sides of the Airport.
3. Haul routes include roads closest to the project site that would be most affected by construction vehicle trips. Construction vehicles trips would disperse onto other roads as they move farther from the project site, reducing the potential for construction traffic impacts.
4. The haul routes and construction phases where construction-related trips would represent more than 1% of existing daily traffic are shaded in red.

As shown in Table 23, construction traffic is expected to increase the average daily traffic by less than 4% in all construction phases. To increase traffic noise levels by 3 dB, a doubling of existing daily traffic is required. With less than a 4% increase in average daily traffic due to construction traffic, the traffic noise increase due to the construction traffic is expected to be less than 3 dB. The expected traffic noise increase is therefore below the discernible level of change for the average human ear in an outdoor environment as discussed in the Human Response to Changes in Noise Levels section (Caltrans 2013). Thus a less than significant impact is expected for alternative-project-related off-site construction traffic noise increases affecting existing residences in the vicinity.

9.2.3 Airport (On-Site) Construction Noise

The main results from the project construction analysis in Section 7.2.4 apply to Alternative 1. For Alternative 1, the north side road is included in Phase 1 (not Phase 5). The noise impacts for

residences along Del Rey Gardens Drive remain the same, but occur during a different phase of construction. The other construction noise impacts would generally be the same for Alternative 1 as for the Project.

9.2.4 Construction Vibration

As discussed for the Proposed Project, construction vibration levels are expected to be less than significant due to the large distance between areas of construction and the residential receptors in the vicinity. The same analysis applies to the project Alternative 1.

INTENTIONALLY LEFT BLANK

10 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Traffic noise impacts due to Alternative 1 are expected to be **less than significant**.

Short-term construction noise impacts are considered **potentially significant** for the existing nearby residences. With incorporation of Mitigation Measure MM NOI 1 short-term construction noise impacts associated with the Proposed Project would be reduced to less than significant.

APPENDIX A

Definitions

APPENDIX A
Definitions

Term	Definition
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
A-Weighted Sound Level (dBA)	The sound pressure level in decibels as measured on a sound-level meter using the A-weighted filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.
Community Noise Equivalent Level (CNEL)	CNEL is the A-weighted equivalent continuous sound exposure level for a 24-hour period with a 10 dB adjustment added to sound levels occurring during nighttime hours (10 p.m. to 7 a.m.) and a 5 dB adjustment added to the sound levels occurring during the evening hours (7 p.m. to 10 p.m.).
Decibel (dB)	A unit for measuring sound pressure level, equal to 10 times the logarithm to the base 10 of the ratio of the measured sound pressure squared to a reference pressure, which is 20 micropascals.
Equivalent Sound Level (L_{eq})	The sound level corresponding to a steady-state sound level and containing the same total energy as a time varying signal over a given sample period. L_{eq} is designed to average all of the loud and quiet sound levels occurring over a specific time period.

TECHNICAL MEMORANDUM

To: Coffman Associates
From: Mott MacDonald
Date: May 1, 2018

RE: Traffic Impact Analysis Report for the Monterey Regional Airport's Proposed Master Plan and Associated Development Projects, Comparison of HCM 2010 vs 6th Edition Analysis

1. Introduction

Mott MacDonald is in the process of preparing the Traffic Impact Analysis (TIA) report for the Monterey Regional Airport's Proposed Master Plan and Associated Development Projects. Mott MacDonald began working on the TIA in November 2016.

During preparation the TIA, updates to two of the industry-standard reference documents used in the TIA were released; the Transportation Research Board (TRB) updated the 2010 Highway Capacity Manual (HCM) with the 6th Edition HCM and the Institute of Transportation Engineers (ITE) updated the 9th Edition of the Trip Generation Manual with the 10th Edition.

This memorandum provides a comparison of the results of the TIA's Existing Conditions scenario using the HCM 2010 and HCM 6th Edition methodologies, to determine whether differences in the HCM 6th Edition would affect the results or conclusions of the TIA.

This memorandum also provides a trip generation comparison of project trips using the ITE 9th Edition and 10th Edition *Trip Generation Manuals*, to determine whether differences in the new manual would result in higher project trip generation estimates.

2. HCM 2010 vs HCM 6th Edition Methodologies

Intersection traffic operations, based on average delay (in seconds per vehicle) and Level of Service (LOS), are being evaluated in the TIA with the Synchro© traffic analysis software (Version 9) using Highway Capacity Manual 2010 (HCM 2010) methodologies. The Synchro© traffic analysis software is widely used in the traffic engineering industry. The TRB released the latest version of the HCM (HCM 6th Edition) in October 2016. Software enabling the use of HCM 6th Edition methodologies was not available at the commencement of the TIA.

Mott MacDonald recently obtained the Synchro© traffic analysis software (Version 10), which allows the use of HCM 6th Edition methodologies. Existing Conditions intersection levels of service and delay at the project intersections using HCM 2010 and HCM 6th Edition methodologies are shown in **Table 1**.

					PM	111.3	F	111.3	F	**0.00**
									Sum of Decreases in Delay with HCM 6th Edition	18.90
									Sum of Increases in Delay with HCM 6th Edition	4.30
									Overall Decrease in Delay with HCM 6th Edition	14.60

Notes:

1 Column 1: Existing Conditions delay and Level of Service (LOS) using HCM 2010 Methodologies.

2 Column 2: Existing Conditions delay and LOS using HCM 6th Edition Methodologies.

3 Column 3: Decreases in delay with HCM 6th Edition are shown in red text.

4 Column 3: Increases in delay with HCM 6th Edition are shown in black text.

5 Column 3: No change in delay between HCM 2010 and HCM 6th Edition shown in bold text.

As shown in **Table 1**, the differences in delay and LOS when comparing the HCM 2010 and HCM 6th Edition methodologies in the analysis of signalized, one-way stop, and all-way stop controlled intersections is minimal. Depending on the location, the HCM 6th Edition analysis results in either less delay (up to 4.2 seconds), slightly more delay (up to 1.2 seconds), or no difference. Considering the sum of the average delay at all the study intersections, the HCM 6th Edition results in a decrease of 18.9 seconds, an increase of 4.3 seconds, and no change at four intersections. The overall difference in delay is a decrease of 14.6 seconds with the HCM 6th Edition.

The differences between the HCM 2010 and HCM 6th Edition in the analysis of signalized and unsignalized intersections are negligible and would not affect the results or conclusions of the TIA.

The TIA also includes an assessment of construction impacts. In determining construction impacts, truck trips associated with the project's construction activities were converted to passenger car equivalents per guidelines in the 2010 HCM (i.e., each truck is estimated to be the equivalent of 2 passenger vehicles). The HCM 6th Edition also uses a passenger car equivalent of 2 passenger vehicles per truck.

3. ITE Trip Generation Manual 9th Edition vs 10th Edition

The TIA includes Long-Term development scenarios that contain a variety of non-aviation land uses, including General Light Industrial and Office Park on the north side of the Airport, and High-Turnover Restaurant, Medical-Dental Office, and General Office on the south side of the Airport.

Trip generation rates in the TIA for the non-aviation land uses are based on rates published in the Institute of Transportation Engineers (ITE) *Trip Generation Manual*, 9th Edition, 2012. The ITE released a new version (10th Edition) of the *Trip Generation Manual* in September 2017. This memorandum also provides a comparison of the estimated trips that would be generated by the project's Long-Term development scenarios using the ITE 9th Edition and 10th Edition *Trip Generation Manuals*, to determine whether differences in the new manual would result in higher trip generation estimates for the Long-Term non-aviation land uses.

Table 2 provides a trip generation comparison between the Proposed Project Long-Term scenario using ITE 9th Edition and 10th Edition trip generation rates. **Table 3** provides a trip generation comparison between the Alternative 1 Project Long-Term scenario using ITE 9th Edition and 10th Edition trip generation rates.

MOTT MACDONALD

San Jose, CA 95110
T 408-572-8800 www.mottmac.com

Table 2. Proposed Project Long-Term Trip Generation Comparison: ITE 9th Edition vs 10th Edition

Proposed Project Long-Term	WEEK DAY	WEEKDAY AM PK HR			WEEKDAY PM PK HR		
Total Net New Generated Trips (9th Edition ITE)	10,991	1,370	1,164	206	1,368	265	1,103
Total Net New Generated Trips (10th Edition ITE)	9,723	1,091	918	173	996	191	805
Decrease in Trips with 10th Edition ITE	(1,268)	(279)	(246)	(33)	(372)	(74)	(298)

Table 3. Alt 1 Project Long-Term Trip Generation Comparison: ITE 9th Edition vs 10th Edition

Alternative 1 Project Long-Term	WEEK DAY	WEEKDAY AM PK HR			WEEKDAY PM PK HR		
Total Net New Generated Trips (9th Edition ITE)	10,991	1,370	1,164	206	1,368	265	1,103
Total Net New Generated Trips (10th Edition ITE)	9,723	1,091	918	173	996	191	805
Decrease in Trips with 10th Edition ITE	(1,268)	(279)	(246)	(33)	(372)	(74)	(298)

As shown in **Tables 2** and **3**, the ITE 10th Edition Trip Generation Manual results in lower trip generation estimates than the 9th Edition for the same land uses. Therefore, estimating trips generated by the project in the Long-Term scenarios using the ITE 10th Edition Trip Generation Manuals would not create any more project impacts than when using the 9th Edition Manual, and may result in fewer impacts.

R. Monterey Regional Airport EIR Traffic Impact Analysis Memorandum of Assumptions

Executive summary

This Traffic Impact Analysis (TIA) report serves as the basis for the Traffic and Circulation Element of the Draft Environmental Impact Report (DEIR) for the Monterey Regional Airport (Airport) Master Plan and its associated projects.

This Traffic Impact Analysis evaluates the potential traffic impacts associated with the projects and actions recommended in the Monterey Regional Airport's Airport Master Plan (AMP). The following four project conditions are analyzed in this study:

Project Conditions

- Proposed Project Short-Term (occurring within ten years)
- Alternative 1 Project Short-Term (occurring within ten years)
- Proposed Project Long-Term (occurring within 20 years)
- Alternative 1 Project Long-Term (occurring within 20 years)

This study includes the following analysis scenarios:

Analysis Scenarios

Weekday AM and PM peak hour traffic operations were analyzed for the following scenarios:

- Existing Conditions
- Existing Plus Proposed Project Short-Term
- Existing Plus Alternative 1 Project Short-Term
- Background Conditions[1] (includes projected growth in enplanements)
- Background Plus Proposed Project Short-Term
- Background Plus Alternative 1 Project Short-Term
- Cumulative Conditions[2] (includes projected growth in enplanements)
- Cumulative Plus Proposed Project Long-Term
- Cumulative Plus Alternative 1 Project Long-Term

Intersections

The study includes detailed level of service analyses for the following study intersections:

1. Olmsted Road / Highway 68
2. Olmsted Road / Garden Road
3. Olmsted Way / Fred Kane Drive
4. Airport Road / Euclid Avenue

[1] Background conditions include those trips generated by approved but not yet built projects in the project vicinity, which have been combined with existing traffic to obtain background traffic volumes.

[2] Cumulative conditions include regional 20-year growth forecasts as well as approved, but not yet built projects in the project vicinity.

5. Airport Road / N. Fremont Street
6. Del Monte Boulevard / Highway 218
7. Highway 218 / Fremont Boulevard
8. Highway 218 / General Jim Moore Boulevard
9. Highway 218 / Del Rey Gardens Drive
10. Highway 218 / Ryan Ranch Road
11. Josselyn Canyon Road / Highway 68
12. Highway 218 / Highway 68
13. Ragsdale Drive / Highway 68
14. York Road / Highway 68
15. Pasadera Drive / Highway 68

19. Torero Drive / Highway 68

Roadway Segments

The study includes detailed level of service analyses for the following study road segments under existing conditions.[3] Future scenarios (including project scenarios) are discussed qualitatively:

1. Highway 68, from Highway 1 to Begin/End Freeway
2. Highway 68, from Begin/End Freeway to Josselyn Canyon Road
3. Highway 68, from Josselyn Canyon Road to Olmsted Road
4. Highway 68, from Olmsted Road to Highway 218
5. Highway 68, from Highway 218 to Ragsdale Drive
6. Highway 68, from Ragsdale Drive to Laureles Grade
7. Highway 68, from Laureles Grade to Corral De Tierra Road
8. Highway 68, from Corral De Tierra Road to Torero Drive
9. Highway 68, from Torero Drive to Begin/End Freeway

Based on the analysis, the Proposed Project Short-Term and Alternative 1 Project Short-Term project scenarios would generate the same amount (and a very small amount) of net new trips on the study road network. The major difference between these project scenarios is how the trips would be distributed (or redistributed) throughout the study network. In terms of net new trips on the study road network, both the Proposed Project Short-Term and Alternative 1 Project Short-Term scenarios are projected to only generate 10 net new daily trips, with 1 net new trip occurring during the AM peak hour and 2 net new trips occurring during the PM peak hour. At some locations, the redistribution of trips would result in a reduction of traffic.

The Proposed Project Long-Term and Alternative 1 Project Long-Term project scenarios contain opportunities for a variety of non-aviation land uses. Representative land uses for purposes of this analysis include General Light Industrial and Office Park on the north side of the Airport, and High-Turnover Restaurant, Medical-Dental Office, and General Office on the south side of

[3] Within the study area, other roadway segments are controlled by numerous controlled intersections and a separate segment analysis is not necessary. This includes the segments of Highway 218 (Canyon Del Rey Road/Boulevard) in the vicinity of the Airport.

the Airport. These non-aviation land uses were chosen for evaluation to represent a conservative (most-impactful), high-level assessment of the possible road network improvements that may be required to accommodate these types of development.

The analysis associated with these Long-Term non-aviation land uses was only considered at a programmatic level. Project-specific traffic studies and other environmental analyses would be required before any of these non-aviation land uses could be developed.

As discussed above, the Proposed Project Short-Term and Alternative 1 Project Short-Term project scenarios would generate a very small amount of net new trips on the study road network, and at some locations, would result in a reduction of traffic. The study intersections and road segments that operate deficiently under the "plus project" scenarios would also operate deficiently under the "without project" scenarios, and the trips generated by these project scenarios would have a negligible effect on traffic operations.

The study intersections and road segments that currently operate deficiently, or are projected to operate deficiently under future conditions, are located along State Highways, and these facilities would operate deficiently even without the trips generated by these project scenarios.

Nevertheless, based on the California Department of Transportation (Caltrans) significant impact criteria, the addition of one project trip can be considered a significant impact when a facility is already operating at unacceptable levels of service without project traffic. Mitigations to reduce the project's impacts to less than significant are provided for each location.

The short-term project scenarios would be responsible for a fair-share contribution towards the total cost of the improvements, based on the relative number of project trips they would add to the facility in question. These improvements would have to be approved by Caltrans, and sufficient funding may not be available for these improvements to be implemented. In these cases, the project's impacts would remain significant and unavoidable due to infeasible mitigation measures.

Project impacts and mitigation measures for the Proposed Project Short-Term and Alternative 1 Project Short-Term scenarios are summarized in Table ES-1. In the long term, future (conservative) development would be the same for either alternative. Cumulative traffic impacts will need to be mitigated on a regional level.

The Airport Master Plan's Sustainability Action Plan identifies the following potential Transportation Demand Management (TDM) strategies to reduce vehicle trips and air emissions:

- Encourage employee and public bicycling by providing convenient, secure bicycle facilities on Airport premises, provide incentives for employees that bike to work, and consider a bike-sharing program for employees and passengers.
- Provide subsidized bus passes to employees and construction workers.
- Facilitate shared vehicle usage by providing infrastructure and vanpool/carpool/alternative fuel vehicle incentives such as rebates and/or preferred parking for staff.
- Provide employee and passenger incentives to encourage the use of alternative fuel vehicles.
- Encourage the use of alternative fuel ground support equipment and shuttle buses.
- Collaborate with local and regional transit authorities regarding multiple transit connection opportunities.

- Develop a reduced idling plan for commercial, construction, airport service, and tenant vehicles.

NOTE: The State of California has approved Senate Bill (SB) 743, which creates a process to change the way that the California Environmental Quality Act (CEQA) addresses transportation impacts. Specifically, the Governor's Office of Planning and Research (OPR) is required to amend the CEQA Guidelines to provide an alternative to level of service (LOS) for evaluating transportation impacts. Particularly within areas served by transit, those alternative criteria must "promote the reduction of greenhouse gases, the development of multimodal transportation networks, and a diversity of land uses." (PRC §21099(b)(1).) Measurements of transportation impacts may include "vehicle miles traveled (VMT), vehicle miles traveled per capita, automobile trip generation rates, or automobile trips generated." Once the CEQA Guidelines are amended to include those alternative criteria, auto delay will no longer be considered a significant impact under CEQA. SB 743 also amends congestion management law to allow cities and counties to opt out of LOS standards within certain infill areas.[4] The CEQA Guidelines changes proposed by OPR have been sent to the California Natural Resources Agency for final administrative approval. Analysis of the Proposed Project's VMT will be addressed in the Traffic, Air Quality, and Greenhouse Gases sections of the EIR.

Notes:
1 NB, SB, EB, WB = Northbound, Southbound, Eastbound, Westbound
2 LTL = Left-Turn Lane, RTL = Right-Turn Lane, TH LN = Through Lane, RTO = Right-Turn Overlap Phasing
3 Proposed Roundabout = Roundabout layout as proposed in the *Highway 68 Scenic Highway Plan* study. Layouts shown in Appendix F.
4 Modified Roundabout = Base roundabout layout as proposed in the *Highway 68 Scenic Highway Plan* study, and modified to achieve acceptable operations. Layouts shown in Appendix F.
5 – = Not applicable or mitigation not required due to no project impact.
6 All the above mitigations that apply to project scenarios also apply to the corresponding non-project scenarios (i.e., Existing, Background, & Cumulative Conditions) and the need for these mitigations would not be triggered by the project. Therefore, the project would be responsible for a fair-share contribution to these improvements.

1 Introduction

This Traffic Impact Analysis (TIA) report serves as the basis for the Traffic and Circulation Element of the Draft Environmental Impact Report (DEIR) for the Monterey Regional Airport (Airport) Master Plan and its associated projects.

1.1 Project Description

The projects that will be evaluated within the Draft EIR include all the projects recommended in the Airport Master Plan as well as the overall on-airport land use plan (which could include non-aviation development and redevelopment on the Airport property). Short-term projects on the Airport property (occurring within ten years) have been evaluated at a project-specific level. Long-term development projects on the Airport property (occurring within 20 years) have only been addressed at a programmatic level due to the lack of project details. Long-term development projects would likely develop in phases over a long period of time. Future environmental analysis for long-term projects will be required prior to approval and construction of these projects.

There are two alternatives for the short-term projects; the Proposed Project Short-Term and the Alternative 1 Project Short-Term. Access to the north side of the Airport is currently provided via Airport Road, which runs through the Casanova Oak Knoll (CONA) neighborhood, located northwest of the Airport. The major difference between the Proposed Project Short-Term and the Alternative 1 Project Short-Term is that the Alternative 1 Project Short-Term includes construction of a new roadway, referred to as the North Side Road, which would extend from Del Rey Gardens Drive in Del Rey Oaks (off Highway 218) to the northeast side of the Airport. The North Side Road would provide access to the north side of the Airport and would allow access through the CONA neighborhood from east of Gate 22 to be discontinued.

Proposed Project Short-Term

The following items are part of the Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations:[5]

- Relocation of 44 General Aviation (GA) hangars from the southeast side of the Airport to the north side of the Airport
- Addition of up to 7 new GA hangars on the north side of the Airport
- Location of a temporary aircraft rescue and firefighting (ARFF) building on the north side

[5] The potential traffic impacts associated with the proposed Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations (safety enhancement project) have been assessed as part of an Environmental Assessment (EA), a federal environmental document prepared consistent with the requirements of the National Environmental Policy Act (NEPA). The Federal Aviation Administrative (FAA) is the lead agency for the EA. The results of the EA TIA have been incorporated into this DEIR TIA. The Proposed Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations includes several inter-related, connected actions associated with increasing the runway-taxiway separation to 327.5 feet (ft) between Taxiway A and Runway 10R-28L to provide additional runway-taxiway separation.

- Relocation of the commercial terminal and apron and permanent ARFF building (and associated parking and roadway improvements) on the south side to accommodate a 52.5-foot southerly shift of a portion of Taxiway "A"[6]

Other proposed short-term airport projects include:

- Land acquisition of a 5.5-acre parcel
- Construction of a Highway 68 frontage loop road

The relocation of the General Aviation hangars from the southeast to the north side of the Airport will cause a redistribution of traffic within the study network. This will reduce traffic at some study intersections and increase traffic at other study intersections. In some cases, it will add and/or subtract traffic from individual movements at study intersections. Under the Proposed Project Short-Term scenario, access to the relocated hangars on the north side of the Airport will be via Airport Road, through the Casanova Oak Knoll Neighborhood (CONA), which is located northwest of the airport.

Alternative 1 Project Short-Term

The following items are part of the Airport Safety Enhancement Project for Taxiway "A" Relocation & Associated Building Relocations (see previous Footnotes 5 and 6):

- Relocation of 44 General Aviation (GA) hangars from the southeast side of the Airport to the north side of the Airport
- Addition of up to 7 new GA hangars on the north side of the Airport
- Reallocation of Port-a-Port T-Hangars and the Navy Flying Club Hangar trips (total of 7 hangars)
- Relocation of the ARFF Building from the south side of the Airport to the north side of the Airport
- North Side Road construction
- Relocation of the commercial terminal and apron (and associated parking and roadway improvements) on the south side to accommodate a 52.5-foot southerly shift of a portion of Taxiway "A"

Other proposed short-term airport projects include:

- Land acquisition of a 5.5-acre parcel
- Construction of a Highway 68 frontage cul-de-sac road

With this alternative, the relocation of the 44 General Aviation hangars from the southeast to the north side of the Airport will also cause a redistribution of traffic within the study network. However, under this project alternative, access to the relocated hangars on the north side of the Airport would be via the North Side Road from Highway 218 and Del Rey Gardens Drive instead of Airport Road through the CONA neighborhood. The Port-a-Port T-Hangars and the Navy Flying Club Hangar are already located on the north side of the Airport. Under this alternative, they would be relocated from their current location but would still be on the north side of the

[6] As discussed in detail in Sections 2.5.2 and 2.6.1 of the EIR, the relocated commercial terminal is proposed to contain approximately 100,000 square feet of building space to address efficiency issues of the existing terminal. Based on preliminary analysis of the proposed commercial terminal's functional spaces, approximately eight percent of the building would be used for administrative functions and 16 percent for building systems and support areas. The remaining 76 percent of the building would be used for arrival and departure functions, the main concourse, and other public spaces. Additional commercial apron depth would be provided to allow the proper parking of the larger aircraft currently operating at the Airport without penetrations of the airfield's safety areas. The existing commercial apron depth does not meet standards. No new vehicular trips are associated with the terminal relocation; the number of aircraft gate positions (five) would remain the same as the existing terminal. Future enplanement levels at the Airport are related to regional and national markets and overall trends in aviation, and are included in the future scenarios of this report as discussed in Sections 5.1 and 7.1.

Airport. However, the construction of the North Side Road would mean traffic generated by the Port-a-Port T-Hangars and the Navy Flying Club would be redistributed to the north side of the Airport via the North Side Road from Highway 218 and Del Rey Gardens Drive instead of Airport Road through the CONA neighborhood.

It is important to note that both the Proposed Project Short-Term and the Alternative 1 Project Short-term scenarios would generate the same amount (and a very small amount) of net new trips on the study road network. The major difference between these project scenarios is how the trips would be distributed (or re-distributed) throughout the study network.

There are also two alternatives for the long-term projects; the Proposed Project Long-Term and the Alternative 1 Project Long-Term. Traffic associated with the Proposed Project and Alternative 1 Project components listed above for the short-term scenarios would also be included in the long-term scenarios, with the following additions:

Proposed Project Long-Term

- Addition of 106 new GA hangars on the north side of the Airport
- Long-Term Non-Aviation Development on the north side of the Airport
- Long-Term Non-Aviation Development on the south side of the Airport
- Redevelopment of the existing airport industrial area (no change in land use intensity)
- North Side Road construction
- Perimeter fence upgrades
- Maintenance building construction
- Runway Protection Zone (RPZ) land acquisition (20 acres)
- RPZ avigation easement (14 acres)
- Taxiway “B” extension to the Runway 28L threshold

Alternative 1 Project Long-Term

- Addition of 106 new GA hangars on the north side of the Airport
- Long-Term Non-Aviation Development on the north side of the Airport
- Long-Term Non-Aviation Development on the south side of the Airport
- Redevelopment of the existing airport industrial area (no change in land use intensity)
- Perimeter fence upgrades
- Maintenance building construction
- Runway Protection Zone (RPZ) land acquisition (20 acres)
- RPZ avigation easement (14 acres)
- Taxiway “B” extension to the Runway 28L threshold

It is important to note that both the Proposed Project Long-Term and the Alternative 1 Project Long-term scenarios would generate the same amount of net new trips on the study road network. There is no difference in the long-term “worst-case” buildout of the Airport between the two alternatives (other than the permanent location of the ARFF building on the north side of the Airport under the Alternative 1 Project scenario.

A project location map is included as **Figure 1. Figures 2** and **3** show the Proposed Project development concept and the Alternative 1 Project development concept, respectively.

1.2 Scope of Work

This study analyzes the potential traffic impacts of the proposed project on the surrounding roadway network. The study area was developed through consultation with Caltrans, Monterey County, and the cities of Monterey, Seaside, and Del Rey Oaks; and Program j.2.1 of the City of Monterey General Plan, which defines the traffic impact study area for proposed projects to include roadway segments where project traffic is expected to increase the existing traffic by two percent (2%) or more. The endpoints between relevant roadway segments were used to derive the study intersections. These facilities would potentially be impacted the greatest from the project.

The study includes the operational evaluation of the following intersections and a qualitative evaluation of the following roadway segments:

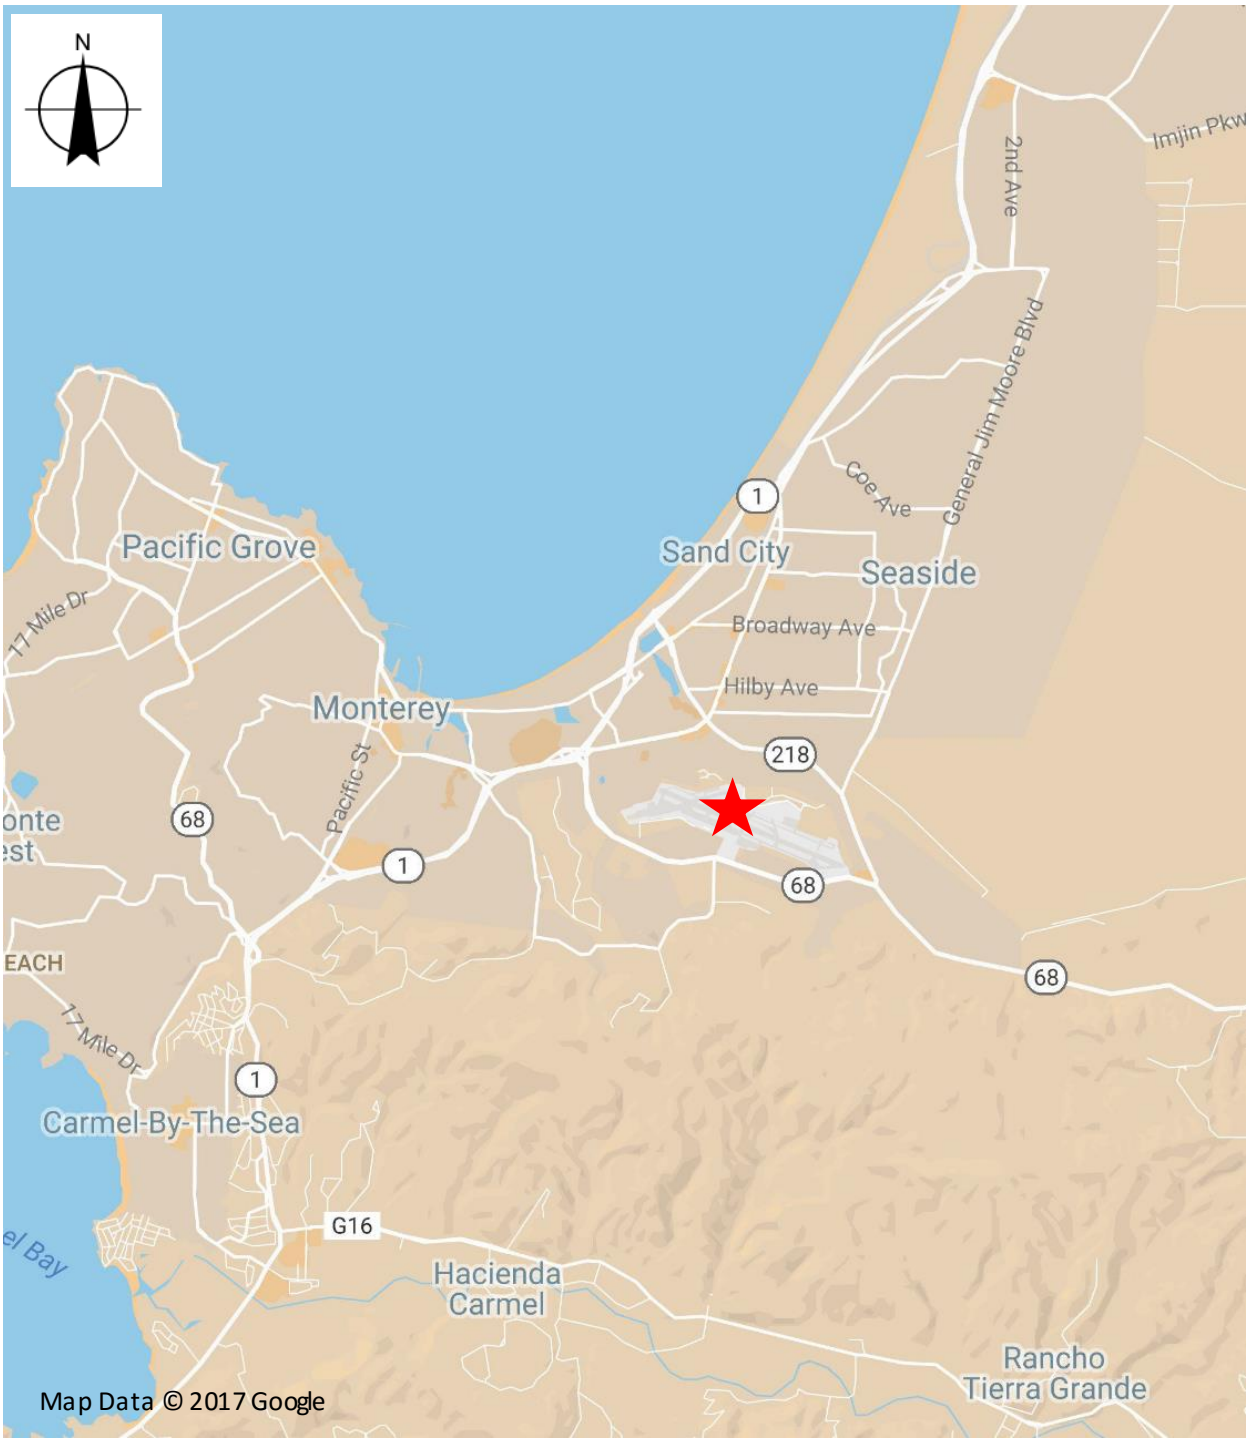
Intersections

1. Olmsted Road / Highway 68
2. Olmsted Road / Garden Road
3. Olmsted Way / Fred Kane Drive
4. Airport Road / Euclid Avenue
5. Airport Road / N. Fremont Street
6. Del Monte Boulevard / Highway 218
7. Highway 218 / Fremont Boulevard
8. Highway 218 / General Jim Moore Boulevard
9. Highway 218 / Del Rey Gardens Drive
10. Highway 218 / Ryan Ranch Road
11. Josselyn Canyon Road / Highway 68
12. Highway 218 / Highway 68
13. Ragsdale Drive / Highway 68
14. York Road / Highway 68
15. Pasadera Drive / Highway 68
16. Laureles Grade Road / Highway 68
17. Corral De Tierra Road / Highway 68
18. San Benancio Road / Highway 68
19. Torero Drive / Highway 68

Roadway Segments

1. Highway 68, from Highway 1 to Begin/End Freeway
2. Highway 68, from Begin/End Freeway to Josselyn Canyon Road
3. Highway 68, from Josselyn Canyon Road to Olmsted Road
4. Highway 68, from Olmsted Road to Highway 218
5. Highway 68, from Highway 218 to Ragsdale Drive
6. Highway 68, from Ragsdale Drive to Laureles Grade
7. Highway 68, from Laureles Grade to Corral De Tierra Road
8. Highway 68, from Corral De Tierra Road to Torero Drive
9. Highway 68, from Torero Drive to Begin/End Freeway

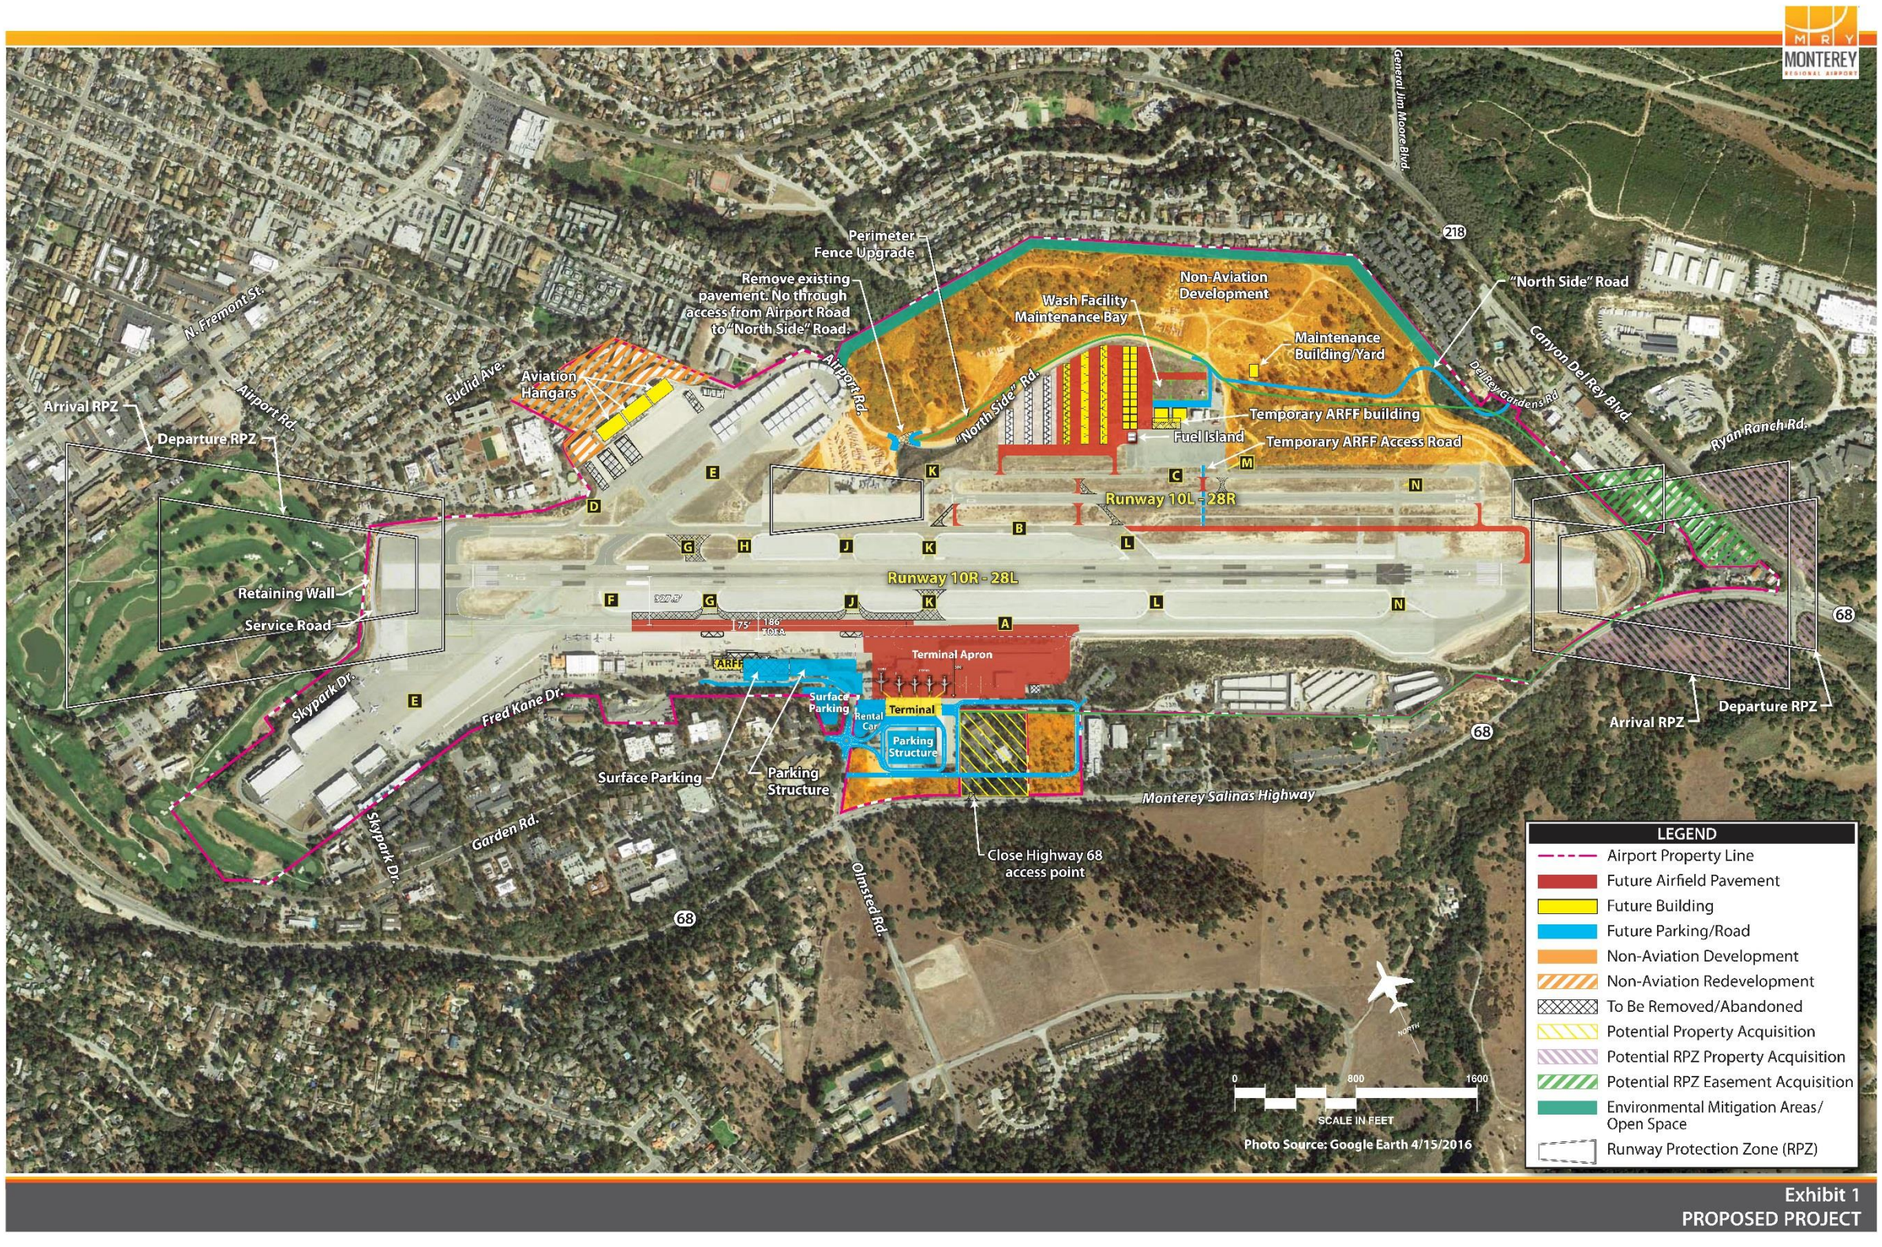
Figure 1: Project Location Map



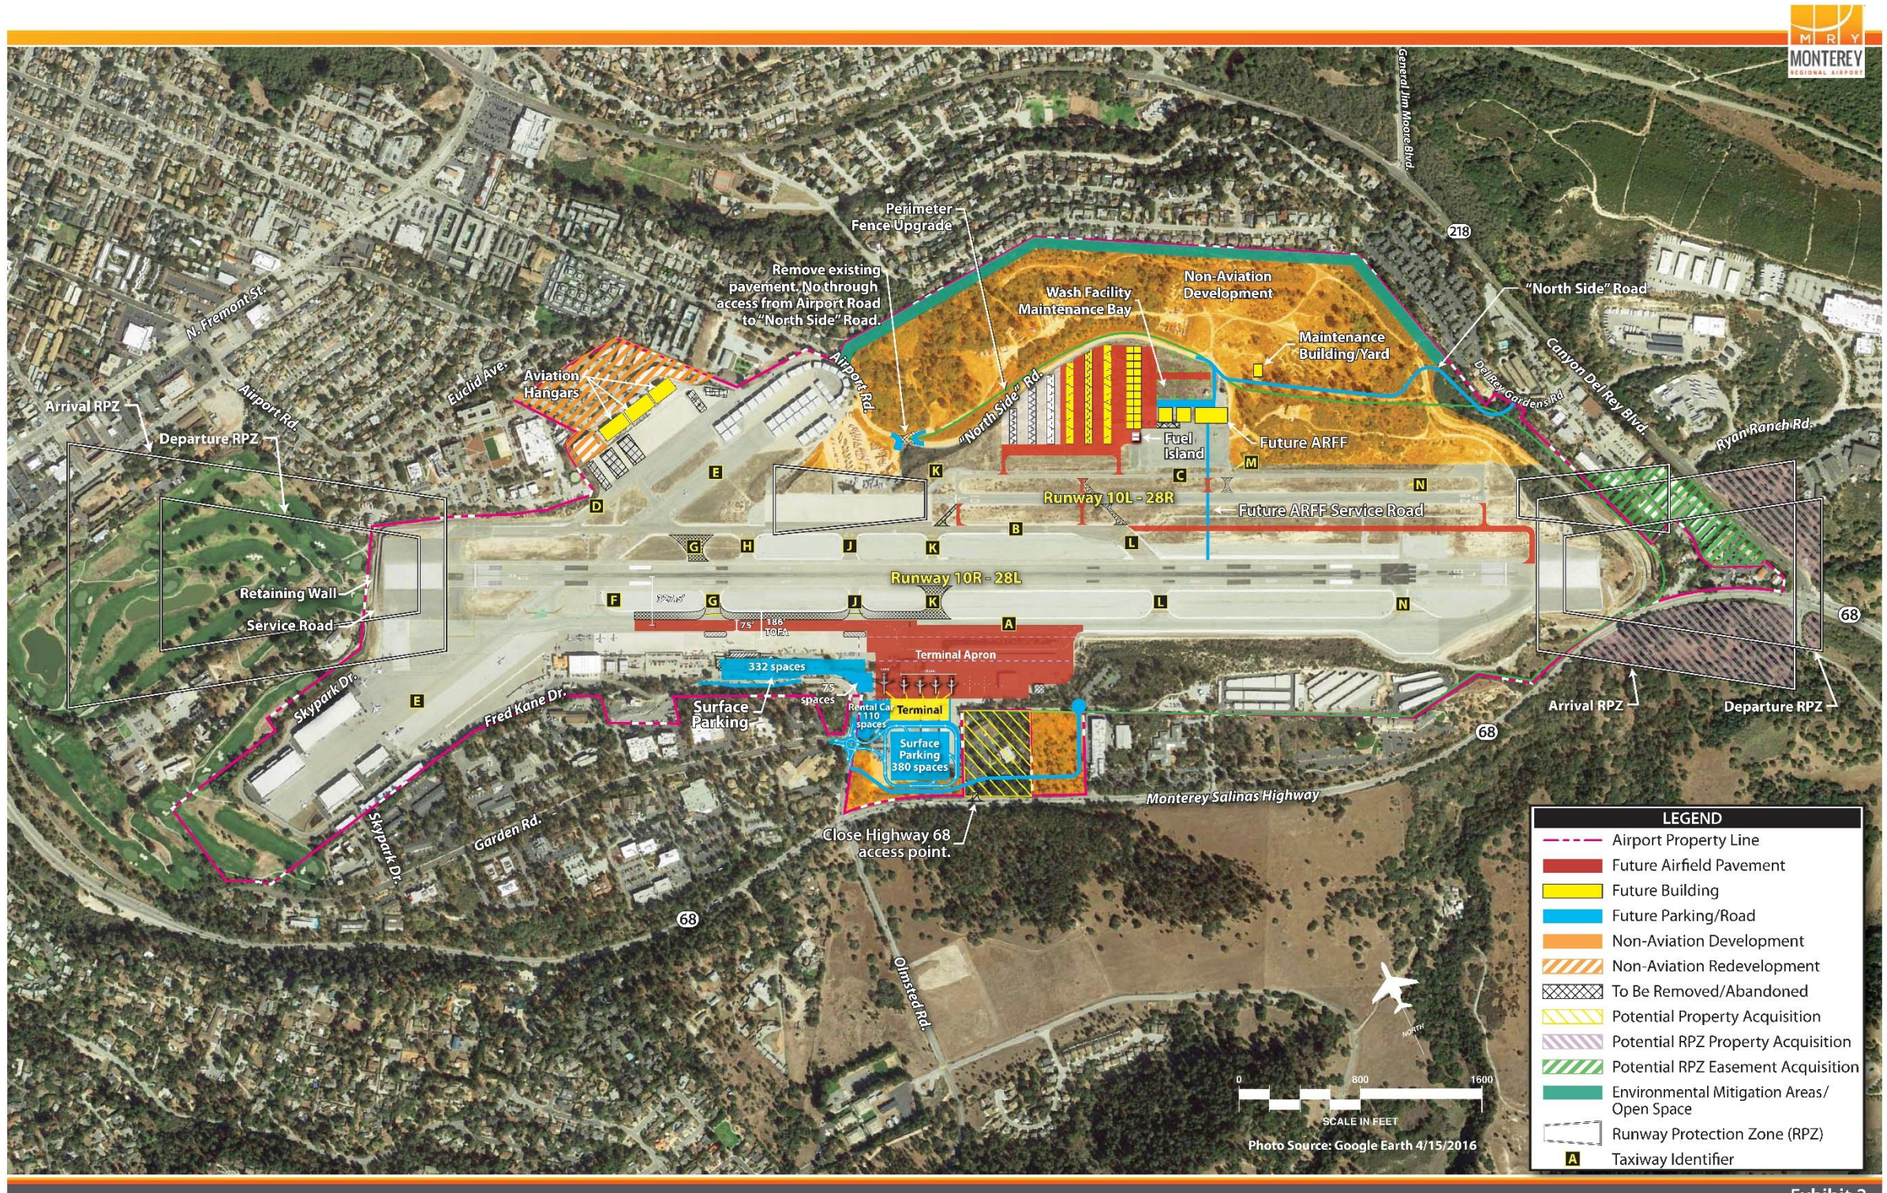
LEGEND

★ Proposed Project Location

Figure 2: Proposed Project Development Concept



Fire 3: Alternative 1 Project Development Concept



Beyond the limits of the study area, the project trips disperse onto numerous local streets or onto regional facilities. The impact of trips that disperse on the local road network lessens as they move away from the project site. The local streets and intersections included in the analysis were identified as potentially having the greatest impact from the project.

Analysis Scenarios

Weekday AM and PM peak hour traffic operations were analyzed for the following conditions:

- Existing Conditions
- Existing Plus Proposed Project Short-Term
- Existing Plus Alternative 1 Project Short-Term
- Background Conditions[7] (includes projected growth in enplanements)
- Background Plus Proposed Project Short-Term
- Background Plus Alternative 1 Project Short-Term
- Cumulative Conditions[8] (includes projected growth in enplanements)
- Cumulative Plus Proposed Project Long-Term
- Cumulative Plus Alternative 1 Project Long-Term

1.3 Traffic Operation Evaluation Methodologies and Level of Service Standards

At the commencement of this study, a Memorandum of Assumptions (MOA) was prepared that presented the analysis methodologies and assumptions that would be used in the study. The MOA included, but was not limited to, a description of the project and methods for data collection, operational analyses, project trip generation, distribution and assignment, future traffic volume forecasting, and significant impact criteria. The MOA was submitted to and approved by representatives at Caltrans, the Transportation Agency for Monterey County, the County of Monterey, and the Cities of Monterey, Seaside, and Del Rey Oaks. The MOA is included in **Appendix R**.

Intersection and road segment traffic operations were evaluated based on the Level of Service (LOS) concept, and the LOS standard adopted by the jurisdiction within which the intersection is located. LOS is a quantitative description of an intersection's operation, ranging from LOS A to LOS F. Level of service "A" represents free flow un-congested traffic conditions. Level of service "F" represents highly congested traffic conditions with what is commonly considered unacceptable delay to vehicles at intersections. The intermediate levels of service represent incremental levels of congestion and delay between these two extremes. LOS descriptions for signalized intersections are included in **Appendix A**. LOS descriptions for unsignalized intersections with two-way stop control are included in **Appendix B**. LOS descriptions for unsignalized intersections with all-way stop control are included in **Appendix C**. LOS descriptions for roundabout-controlled intersections are included in **Appendix D**.

Intersection traffic operations were evaluated using the Synchro© traffic analysis software (Version 9) using Highway Capacity Manual 2010 (HCM 2010) methodologies. Synchro© is widely used in the traffic engineering industry and its use is accepted by Caltrans, Monterey County, and the Cities of Monterey, Seaside, and Del Rey Oaks. The HCM is published by the Transportation Research Board (TRB). The TRB released the latest version of the HCM (HCM

[7] Background conditions include those trips generated by approved but not yet built projects in the project vicinity, which have been combined with existing traffic to obtain background traffic volumes.

[8] Cumulative conditions include regional 20-year growth forecasts as well as approved, but not yet built projects in the project vicinity.

6th Edition) in October 2016. Software enabling the use of HCM 6th Edition methodologies was not available at the commencement of this study. However, differences between the HCM 2010 and HCM 6th Edition in the analysis of signalized and unsignalized intersections are negligible and would not affect the results or conclusions of this study.

Intersection operations are based upon the average vehicular delay at the intersection. The average delay is then correlated to a level of service. For one-way and two-way stop controlled intersections, the vehicle delay for side street traffic is analyzed. LOS for each side street movement is based on the distribution of gaps in the major street traffic stream and driver judgment in selecting gaps. Improvements may be warranted when a side street approach reaches LOS F for one-way and two-way stop controlled intersections. When using the HCM 2010 methods for the analysis of signalized intersections, the overall intersection delay is used to determine LOS. The 95th percentile vehicle queues at all signalized study intersections were estimated using the Synchro© traffic analysis software (Version 9). The 95th percentile queue lengths (in feet) are queues that have a 5-percent probability of being exceeded during the analysis period.

A saturation flow rate of 1,600 vehicles per lane per hour was used for the eastbound and westbound through movements along Highway 68, as requested by Caltrans District 5 staff in an email dated May 17, 2017.

Existing conditions two-lane highway segment operations are based on percent time spent following (PTSF), per Exhibit 15-3 of the 2010 HCM. Multi-lane highway segment operations are based on density in passenger cars per mile per lane (pc/mi/ln) per Exhibit 14-4 of the 2010 HCM. LOS descriptions for two-lane highway and multi-lane highway road segments are included in **Appendix E**.

The study area covers the jurisdictions of multiple public agencies, including the Cities of Monterey; Del Rey Oaks; and Seaside, Caltrans, and Monterey County. Most of the study intersections are located on State Highways 68 and 218 and all the study road segments are located on State Highway 68. Therefore, the Caltrans level of service standard (i.e., the transition from LOS C to LOS D) is the level of service standard for these facilities. The only facilities in the study area that are not under the jurisdiction of Caltrans are the following intersections, which are under the jurisdiction of the City of Monterey. The City of Monterey level of service standard for these intersections is LOS D.

2. Garden Road/Olmsted Road
4. Airport Road/Euclid Avenue
5. N. Fremont Street/Airport Road

1.4 Modeling of Right Turn on Red (RTOR)

All the signalized study intersections allow right turns on red (RTOR), and these right turns can influence the intersection LOS calculations. There are several options to model right turns on red with different traffic analysis software packages, but the only method prescribed by the HCM for modeling RTOR is to reduce the input volumes to account for vehicles turning right on red. Where an exclusive right turn lane movement runs concurrent with a protected left turn phase from the cross street, the HCM allows for the right turn volume to be reduced by the number of shadowed left turners. However, the length of the right turn lane affects the number of vehicles that can turn right on red. This is because a short right turn lane can result in right turning vehicles being trapped in the queue with vehicles in the through lane. Due to the already-congested conditions on Highway 68, it will be assumed that no vehicles would be able to turn

right on red at the study intersections on Highway 68 between Josselyn Canyon Road and San Benancio Road.

1.5 SR 68 Scenic Highway Plan Study

In August 2017, the Transportation Agency for Monterey County (TAMC) completed the *SR 68 Scenic Highway Plan* study. The purpose of the study was to identify a Preferred Corridor Concept for Highway 68 to relieve congestion and improve safety and reliability along the corridor, with improvements phased in over a 20-year timeframe.

The study recommended the "Roundabout Corridor: Concept 1 – Modified" as the Preferred Corridor Concept. This alternative includes converting nine of the Highway 68 study intersections in this study to roundabout control.

Implementation of the Preferred Corridor Concept is expected to occur in the following four phases; Immediate-Term (0-3 years), Short-Term (4-6 years), Mid-Term (7-10 years), and Long-Term (11-20 years). The Immediate-Term phase includes refining the preliminary roundabout layouts, coordinating with Caltrans on a corridor-wide Project Initiation Document, and creating a Highway 68 Improvement Corridor Team with Caltrans, TAMC, the County of Monterey, the Monterey Peninsula Airport District, and the cities of Monterey, Del Rey Oaks, and Seaside.

The nine study intersections and the proposed phase for conversion to roundabout control are listed below.

Intersection #1 – Olmsted Road / Highway 68, Short-Term (4-6 years)
Intersection #11 – Josselyn Canyon Road / Highway 68, Mid-Term (7-10 years)
Intersection #12 – Highway 218 / Highway 68, Short-Term (4-6 years)
Intersection #14 – York Road / Highway 68, Mid-Term (7-10 years)
Intersection #15 – Pasadera Drive / Highway 68, Mid-Term (7-10 years)
Intersection #16 – Laureles Grade Road / Highway 68, Mid-Term (7-10 years)
Intersection #17 – Corral De Tierra Road / Highway 68, Short-Term (4-6 years)
Intersection #18 – San Benancio Road / Highway 68, Short-Term (4-6 years)
Intersection #19 – Torero Drive / Highway 68, Short-Term (4-6 years)

In addition, the Airport is proposing to convert the following study intersection to a roundabout:

Intersection #2 – Olmsted Road / Garden Road

As a result, in addition to being analyzed with their existing lane configurations and intersection controls, these intersections were also analyzed as roundabouts under all short-term project analysis scenarios. Graphical representations of the proposed roundabout layouts from the *SR 68 Scenic Highway Plan* study are included in **Appendix F**. These layouts were used as a starting point for the roundabout analyses in this report. When necessary, the proposed roundabout layouts were modified to achieve acceptable operations under each analysis scenario. The modified roundabout layouts are also included in **Appendix F**.

1.6 Highway 218 Corridor Study

The Transportation Agency for Monterey County (TAMC) is in the beginning stages of a Highway 218 corridor study. The study will engage the community, analyze existing conditions, identify bicycle and pedestrian improvements, and develop multimodal conceptual improvements along the corridor and at major intersections. The study will also analyze the potential of Caltrans relinquishing the corridor to local agencies.

The purpose of the study is to improve access to the land uses along the corridor and to create a more “complete” corridor that would serve a broad range of users and modes of transportation.

1.7 North Fremont Street Specific Plan

The *North Fremont Specific Plan* is a guide for future mixed-use development along North Fremont Street between Highway 1 and Canyon Del Rey Boulevard (Highway 218). In addition to establishing architectural design standards and guidelines, the plan encourages the implementation of bicycle, pedestrian, and transit improvements, which will be implemented as development occurs along the corridor.

The following improvements are envisioned for the North Fremont Street corridor:

- Expanded Sidewalks
- Improved / Shorter Crosswalks
- Pedestrian Plazas and Walkways
- Inter-Block Walkways
- Pedestrian Landscape Buffers
- Benches
- Pedestrian-Scale Sidewalk Lighting
- Parking Hidden from Street
- Enhanced Connections to Bus Transportation
- Improved Bus Headways
- Class II Bike Lanes
- Enhanced Bicycle Connections
- Bike Racks

The timing of these improvements is dependent on market conditions and the pace of future development.

1.8 Criteria for Project Impacts

Per current (2017) CEQA guidelines, a project may have a significant effect on the environment if it would cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system. In accordance with CEQA, impact criteria have been applied to the study intersections and road segments to determine if project-related increases in traffic are substantial in relation to the existing traffic load and capacity of the street system.

As described in Section 1.3, the study area falls within multiple jurisdictions. The impact criteria for the applicable jurisdictions are listed below and have been applied to the analysis results.

Caltrans Impact Criteria

Per the Caltrans *Guide for the Preparation of Traffic Impact Studies* (December 2002), Caltrans perceives an impact when there is any degradation in the performance measure below the

transition between LOS C/D. If a facility is currently operating at or below LOS D, then any trips added represent a potential impact, and the performance measure should be brought back to predevelopment conditions. While a single trip added to a degraded facility is not usually reflected in the performance measure, Caltrans reserves the ability to consider a single trip as an impact.

City of Monterey Impact Criteria

Per Program j.2.2 of the City of Monterey General Plan, project traffic impacts to City of Monterey roadway segments are considered significant if the project is expected to reduce a roadway segment to an unacceptable LOS or further degrade an already unacceptable LOS under cumulative traffic conditions during typical (i.e., non-summer) weekday traffic conditions.

The City of Monterey does not have impact criteria for intersections. Therefore, per consultation with the City of Monterey Traffic Engineer (in an email dated October 28, 2016), the Monterey County impact criteria were applied to City of Monterey intersections for determining traffic impacts from the Project.

Monterey County Impact Criteria

Per the Monterey County *Guide for the Preparation of Traffic Impact Studies* (March 2014), an impact at a signalized study intersection is defined to occur under the following conditions:

A significant impact would occur if an intersection operating at LOS A, B, C or D degrades to E or F. For intersections already operating at unacceptable level E, a significant impact would occur if a project adds 0.01 or more during peak hours to the critical movement's volume-to-capacity ratio. If the intersection is already operating at LOS F, any increase (one vehicle) in the critical movement's volume-to-capacity ratio is considered significant.

An impact at an unsignalized study intersection is defined to occur under the following conditions:

An impact would occur if an all-way stop controlled or roundabout controlled intersection, based on the average delay, operates at LOS F or any traffic signal warrant is met.

An impact would occur if a two-way stop controlled intersection, based on the worst approach delay, operates at LOS F or any traffic signal warrant is met.

1.9 Construction Impact Analysis Methodology

Caltrans and the Cities of Monterey, Seaside, and Del Rey Oaks do not assign specific thresholds for determining construction impacts to their transportation facilities. Presumably, this is because construction impacts are temporary and impacts associated with project construction are typically less than those caused by the daily operations of the project itself, and those impacts would be mitigated by the implementation of the proposed project's mitigation measures. The number of daily construction vehicle trips generated by the project were estimated and compared to existing traffic volumes to provide a sense of the magnitude of construction vehicle trips on the study road network in relation to existing traffic volumes.

2 Existing Traffic Conditions

This section describes the existing street network relevant to the Proposed Project and the existing operational traffic conditions.

2.1 Existing Roadway Network

The key roadways in the vicinity of the proposed project are described below. Highway 1, Highway 218, and Highway 68 provide regional access to the project site.

Del Monte Avenue – Del Monte Boulevard is a major four-lane arterial that runs through the cities of Monterey and Seaside. Del Monte Boulevard is a four-lane divided arterial in the vicinity of the project with a posted speed limit of 35 mph.

N. Fremont Street – Fremont Boulevard is a major four-lane divided arterial that runs through the cities of Monterey and Seaside. N. Fremont Street is a four-lane divided arterial in the vicinity of the project, and provides access to the north side of the Airport via the Casanova Oak Knoll neighborhood (referred to as CONA). The posted speed limit is 35 mph in the City of Monterey and 30 mph in the City of Seaside.

Highway 68 (SR 68) connects State Route 1 in Monterey and US 101 in Salinas. It is a 2-lane rural highway from east of Highway 1 to west of Highway 218 (where it provides access to the south side of the Airport, including the commercial terminal, via Olmsted Road), and a 4-lane highway from Highway 218 to Ragsdale Drive. Between Ragsdale Drive and the Portola Drive interchange, Highway 68 is a 2-lane highway. Highway 68 is a 4-lane freeway between the Portola Drive and Spreckels Boulevard interchanges, and a 4-lane divided highway from the Spreckels Boulevard interchange to Blanco Road in the City of Salinas. It serves as a commuter route between Salinas and the Monterey Peninsula, and functions as a scenic tourist route to the Monterey Peninsula. The posted speed limit on Highway 68 is 55 mph.

Highway 218 (SR 218) is a two-lane highway that connects Highway 68 and Highway 1. It provides access to Del Rey Oaks, Sand City and Seaside. It is designated as “Canyon Del Rey Road” in Del Rey Oaks and “Canyon Del Rey Boulevard” in Seaside. There is currently no access to the Airport via Highway 218. The posted speed limit on Highway 218 is 45 mph.

Olmsted Road is a two-lane collector running in a north-south direction. It provides access to the Monterey Regional Airport north of Highway 68, and residential development south of Highway 68. The speed limit on Olmsted Road is unsigned, except for a 25-mph school zone located about 1,200 feet south of Highway 68.

General Jim Moore Boulevard is a major arterial within the Cities of Marina, Seaside, and Del Rey Oaks. In the immediate project vicinity, General Jim Moore Boulevard is a two-lane, undivided roadway in the City of Del Rey Oaks. General Jim Moore Boulevard becomes a four-lane divided arterial in the City of Seaside, approximately 1,500 feet north of Highway 218. The speed limit is 35 mph in Del Rey Oaks and 45 mph in Seaside.

Airport Road is a two-lane collector road that provides access to the Monterey Regional Airport, the naval research and meteorological center, aviation and non-aviation light industrial land uses, and the Casanova Oak Knoll neighborhood. North of N. Fremont Street, Airport Road

becomes Dela Vina Avenue, a two-lane collector road that provides access to the residential neighborhoods on the north side of N. Fremont Street. The posted speed limit on Airport Road is 25 mph.

Del Rey Gardens Drive is a local access road that serves a small residential area as well as some light industrial land uses. The proposed North Side Road would connect to Highway 218 via Del Rey Gardens Drive.

Josselyn Canyon Road is a two-lane road that provides access to low-density residential development as well as a church and a convalescent hospital. The posted speed limit on Josselyn Canyon Road is 25 mph.

Ragsdale Drive is four lanes in the vicinity of the study area and provides access to the Ryan Ranch business park. The posted speed limit on Ragsdale Drive is 35 mph.

York Road provides access to single unit housing developments as well as the Laguna Seca and Ryan Ranch Business Parks and York School, all located north of Highway 68. The posted speed limit on York Road is 25 mph.

Pasadera Drive is a private road north of Highway 68. It provides access to the Nicklaus Club – Monterey (formerly Pasadera Country Club) and its associated single unit housing development. The posted speed limit on Pasadera Drive is 25 mph.

Boots Road provides access to a small number of residential developments south of Highway 68. The posted speed limit on Boots Road is 25 mph.

Laureles Grade Road is a two-lane north/south county road that connects Highway 68 with the Carmel Valley and provides access to several residential developments. The posted speed limit on Laureles Grade Road is 45 mph.

Corral de Tierra Road is a two-lane collector road with a speed limit of 35 mph. It provides access to residential developments.

San Benancio Road is a two-lane collector road with a speed limit of 35 mph. It provides access to residential developments.

Torero Drive is a two-lane road that provides access to the Toro Park neighborhood north of Highway 68. The speed limit on Torero Drive is unsigned.

2.2 Existing Traffic Volumes

Weekday AM and PM peak period turning movement counts were conducted at the study intersections during typical commute periods (i.e., from 7:00 AM to 9:00 AM and from 4:00 PM to 6:00 PM) in January 2015, June 2015, February 2016, and November 2016. The counts included cars, trucks, buses, bicyclists, and pedestrians. The weekday AM and PM peak hour volumes were derived from these counts. The turning movement count data is included in **Appendix G**.

The February 2016 counts were conducted by Kimley-Horn for TAMC for the *SR 68 Scenic Highway Plan* study. These counts were conducted at the study intersections along Highway 68 and were provided to Mott MacDonald for use in this study. Mott MacDonald conducted counts in the study area in January and June 2015 for the *Monterey Bay Operations and Maintenance Facility Project Traffic Impact Analysis* and the *Del Rey Oaks RV Park Traffic Impact Analysis* traffic studies and in November 2016 for this study. Peak hour segment volumes were derived from the peak hour intersection counts. Traffic counts conducted in the CONA neighborhood are discussed in Section 2.6.

The intersection turning movement counts along Highway 68 for the above studies were compared and, to present a more conservative analysis, the highest count at each intersection was used in the analysis. Traffic volumes in January and February tend to be lower than average. As a result, traffic volumes that were collected in January and February were increased by 4.9% to represent average conditions. The 4.9% seasonal adjustment factor is consistent with monthly adjustment factors in the project study area, which are included in the *Annual Average Daily Traffic 2016* booklet published by the Monterey County Department of Public Works Traffic Engineering division.

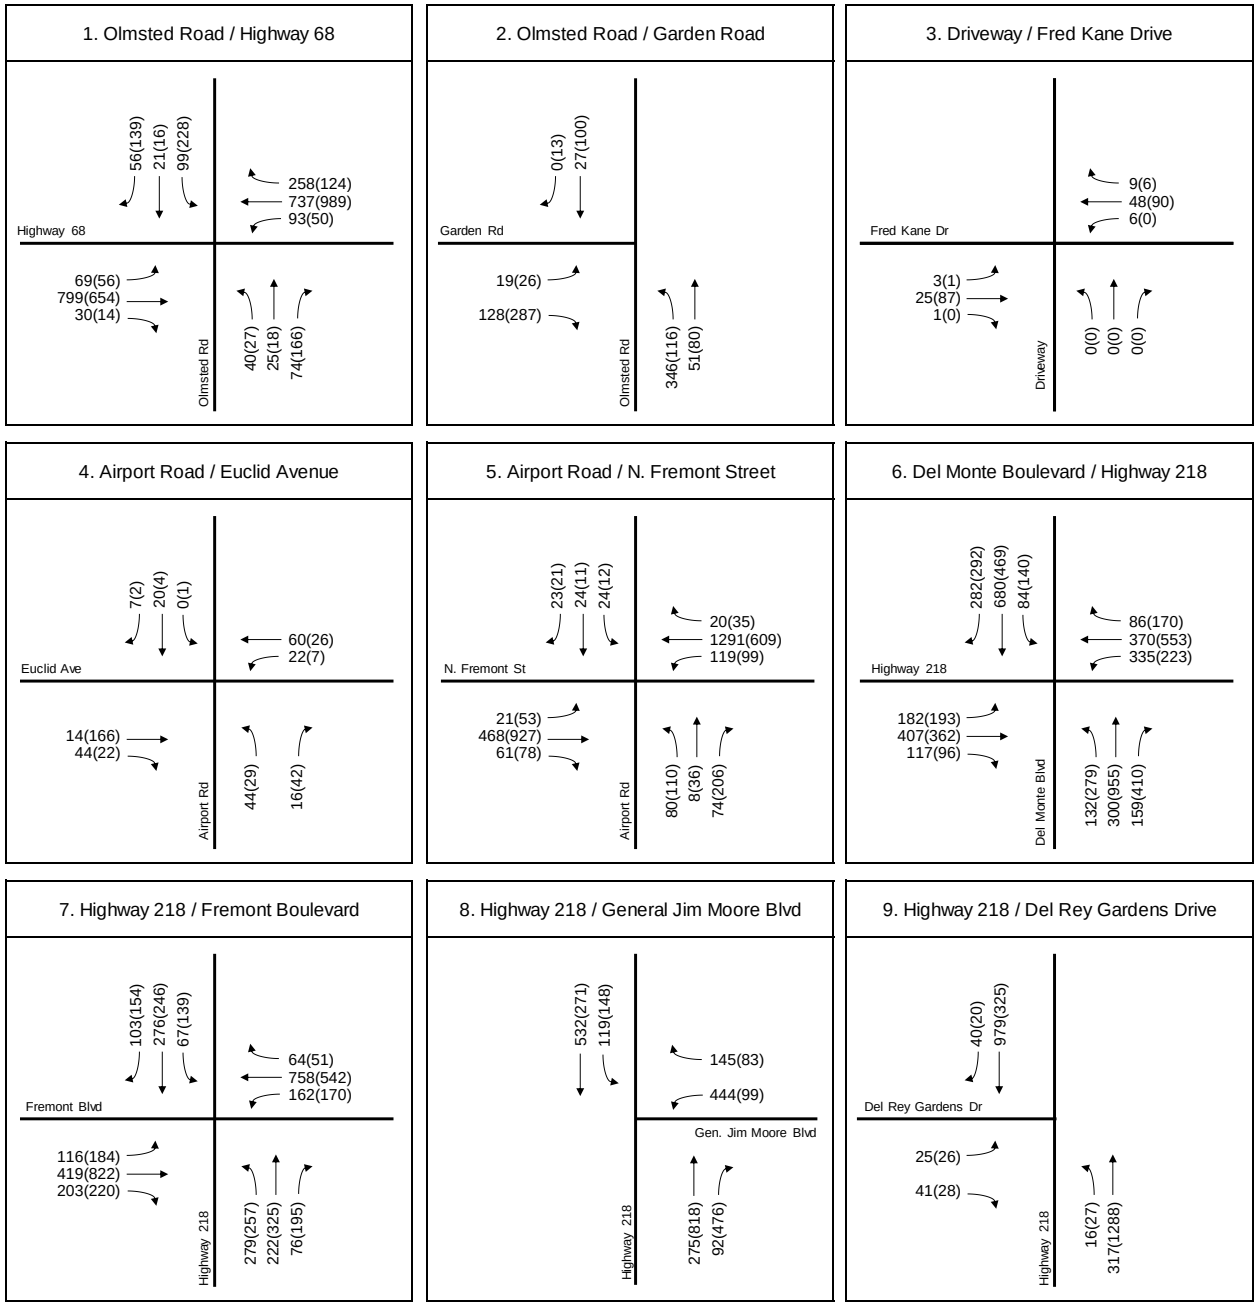
The Existing conditions weekday AM and PM peak hour traffic volumes at the study intersections are shown in **Figures 4** and **5**.

Turning movement counts were also conducted at other selected intersections around the Airport. These counts were used to develop traffic reassignments under Project conditions.

The Casanova Oak Knoll neighborhood is located northwest of the Airport. Twenty-four-hour roadway segment counts were conducted at various times of the year at selected locations around the Airport and within the CONA neighborhood to identify existing traffic circulation patterns, and to quantify the relative percentage of traffic on Airport Road that is attributable to the Airport, the naval research and meteorological center, and local neighborhood activities. Additional discussion regarding traffic conditions and data collection efforts in the CONA neighborhood is included in Section 2.6.

A map showing the approximate boundaries of the CONA neighborhood and its location relative to the Airport is shown in **Figure 6**.

Figure 4: Existing AM & PM Peak Hour Volumes (1 – 9)



XX (YY) = AM (PM)

Count Dates:

January 2015 - Intersections 7, 8, 10
June 2015 - Intersection 6
Februrary 2016 - Intersections 1, 11-19
November 2016 - Intersections 2-5, 9

Figure 5: Existing AM & PM Peak Hour Volumes (10 – 19)

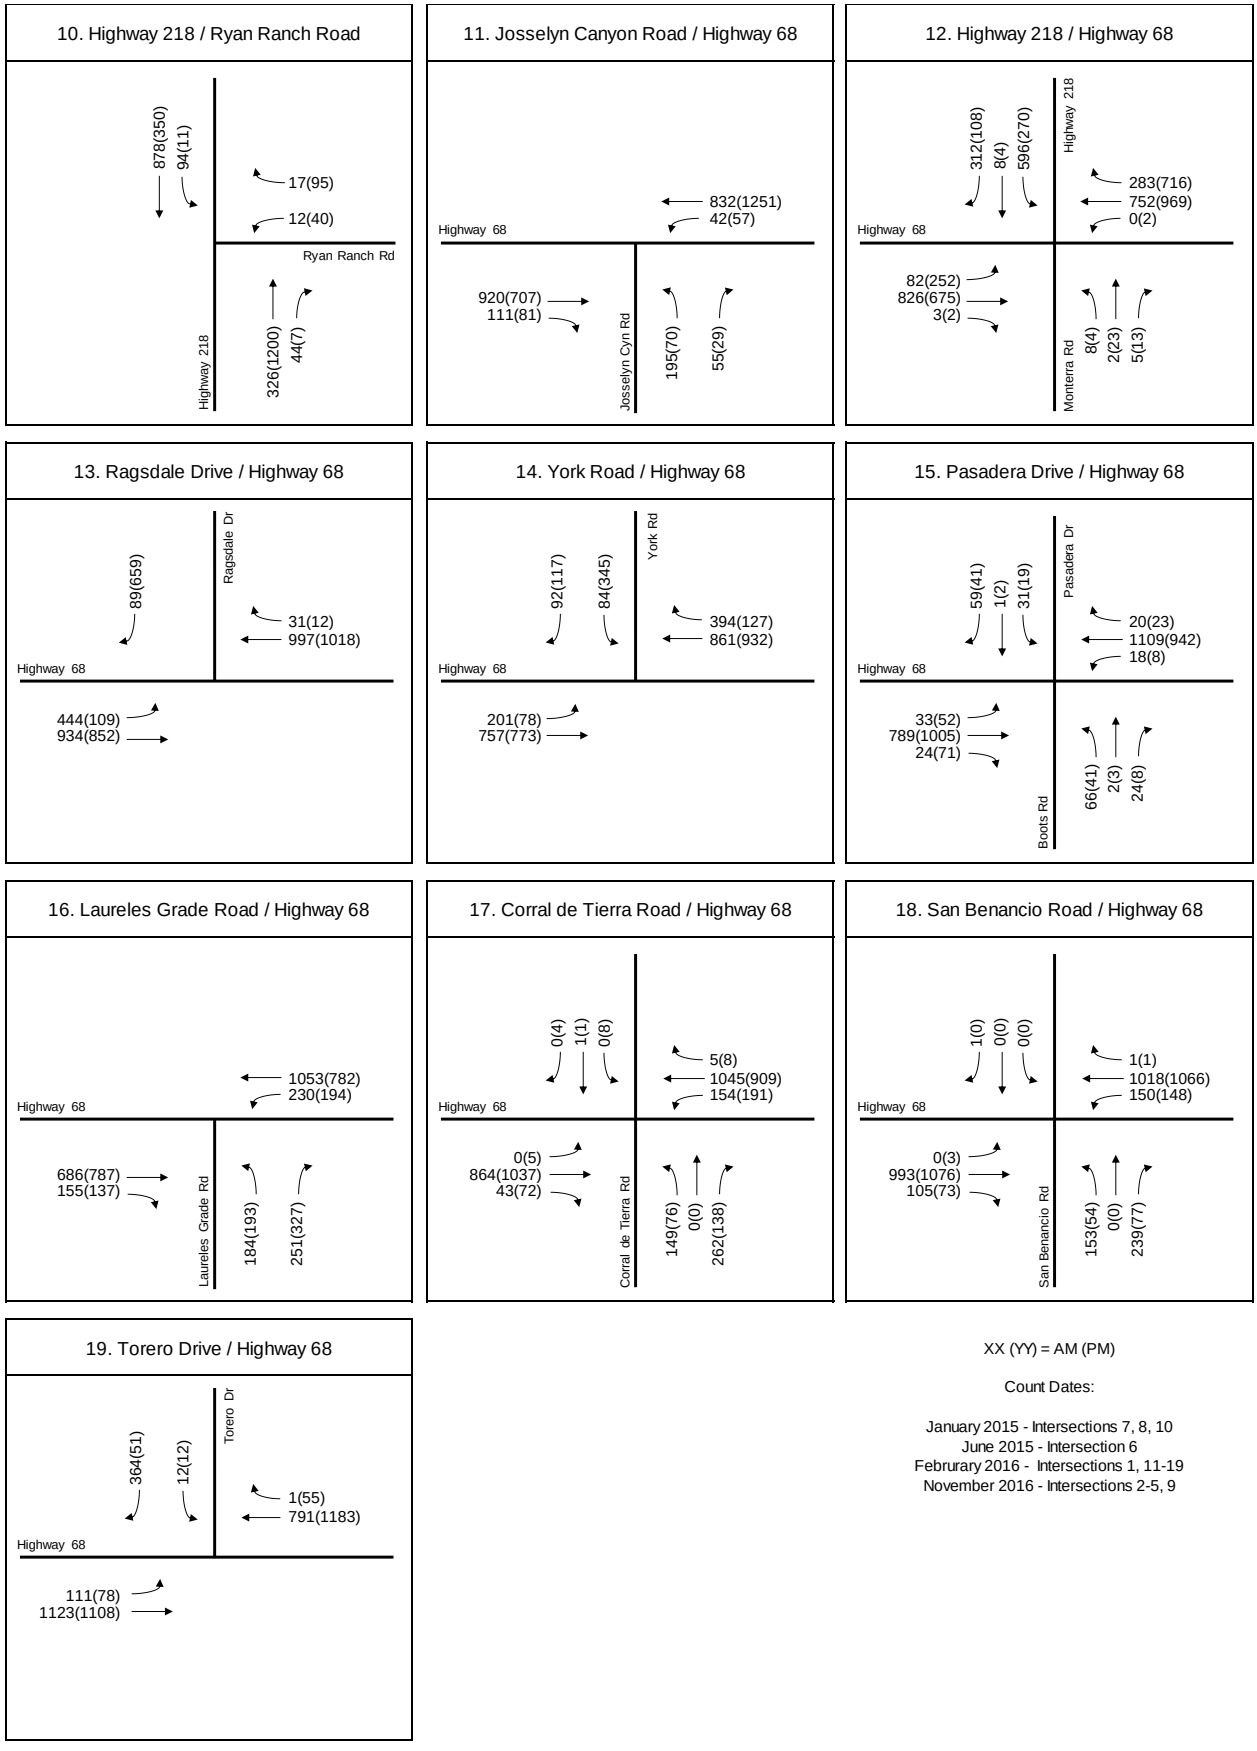


Figure 6: Location of CONA Neighborhood

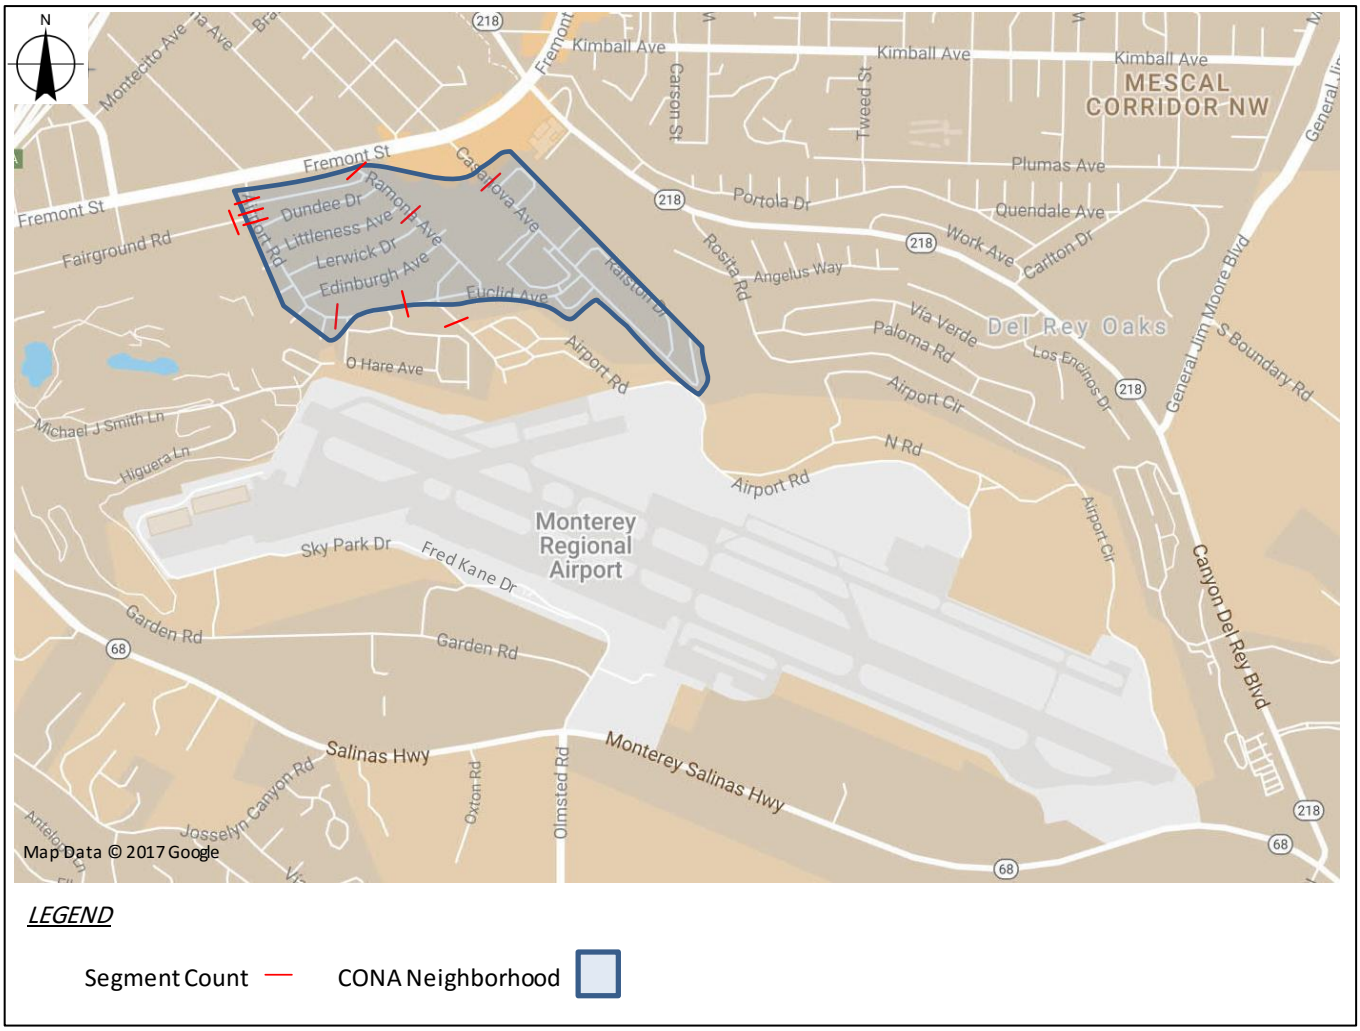

2.3 Existing Intersection Operations

Based on the City of Monterey and Caltrans level of service standards, the following study intersections operate deficiently under Existing traffic conditions:

Intersection #1 – Olmsted Road / Highway 68

Intersection #6 – Del Monte Boulevard / Highway 218

Intersection #7 – Highway 218 / Fremont Boulevard

Intersection #11 – Josselyn Canyon Road / Highway 68

Intersection #14 – York Road / Highway 68

Intersection #15 – Pasadera Drive / Highway 68

Intersection #17 – Corral De Tierra Road / Highway 68

Intersection #18 – San Benancio Road / Highway 68

Intersection #19 – Torero Drive / Highway 68

Existing intersection LOS are summarized in **Tables 1** and **2**. LOS calculation worksheets are included in **Appendix H**. Vehicle queue estimates are included in **Appendix I**.

Table 1: Existing Conditions Intersection LOS (1 – 9)

Scenario # →						1	
	N-S Street	E-W Street	Int Control	LOS Std	Peak Hour	Existing	
						Delay	LOS
1	Olmsted Road	Highway 68	Signal	C/D	AM	51.0	D
					PM	126.0	F
2	Olmsted Road	Garden Road	One-Way Stop	D	AM	10.7	B
					PM	10.8	B
3	Olmsted Way	Fred Kane Drive	All-Way Stop	D	AM	7.6	A
					PM	8.2	A
4	Airport Road	Euclid Avenue	Two-Way Stop	D	AM	9.8	A
					PM	10.1	B
5	Airport Road	N. Fremont Street	Signal	D	AM	11.7	B
					PM	14.2	B
6	Del Monte Boulevard	Highway 218	Signal	C/D	AM	34.3	C
					PM	38.9	D
7	Highway 218	Fremont Boulevard	Signal	C/D	AM	31.3	C
					PM	46.1	D
8	Highway 218	General Jim Moore Blvd	Signal	C/D	AM	17.0	B
					PM	15.2	B
9	Highway 218	Del Rey Gardens Drive	One-Way Stop	C/D	AM	24.1	C
					PM	19.0	C

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).

2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).

3 LOS highlighted in red indicates intersection operating below level of service standard.

4 * = delay greater than 300 seconds.

5 LOS in bold box indicates project impact.

Table 2: Existing Conditions Intersection LOS (10 – 19)

Scenario # →						1	
	N-S Street	E-W Street	Intersection Control	LOS Standard	Peak Hour	Existing	
						Delay	LOS
10	Highway 218	Ryan Ranch Road	Signal	C/D	AM	6.9	A
					PM	16.6	B
11	Josselyn Canyon Road	Highway 68	Signal	C/D	AM	44.5	D
					PM	19.8	B

15	Pasadera Drive	Highway 68	Signal	C/D	AM	47.5	D
					PM	14.5	B
16	Laureles Grade Road	Highway 68	Signal	C/D	AM	27.2	C
					PM	31.7	C
17	Corral de Tierra Road	Highway 68	Signal	C/D	AM	35.2	D
					PM	57.8	E
18	San Benancio Road	Highway 68	Signal	C/D	AM	70.3	E
					PM	18.9	B
19	Torero Drive	Highway 68	One-Way Stop	C/D	AM	*	F
					PM	111.3	F

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).

2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).

3 LOS highlighted in red indicates intersection operating below level of service standard.

4 * = delay greater than 300 seconds.

2.4 Existing Road Segment Operations

Existing conditions weekday AM and PM peak hour road segment traffic volumes were derived from the intersection traffic volumes discussed in Section 2.2.

Road segment levels of service are summarized in **Table 3**. LOS calculation worksheets are included in **Appendix J**. The road segment levels of service in Table 3 are consistent with the results of the *SR 68 Scenic Highway Plan* study.

Based on the level of service standards, the following study road segments operate deficiently under Existing traffic conditions:

Segment #2 – Highway 68, from Begin/End Freeway to Josselyn Canyon Road

Segment #3 – Highway 68, from Josselyn Canyon Road to Olmsted Road

Segment #4 – Highway 68, from Olmsted Road to Highway 218

Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade

Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road

Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive

Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

Table 3: Existing Conditions Road Segment Levels of Service

	Roadway Segment From - To		Roadway Type	Direction	LOS Standard	Existing Conditions					
						AM Peak			PM Peak		
						Volume	Density / PTSF	LOS	Volume	Density / PTSF	LOS
1	Highway 68	Highway 1 - Begin/End Freeway	4-Lane Freeway	EB	C/D	983	10.5	A	794	7.7	A
				WB		979	10.5	A	1,217	11.8	B
2	Highway 68	Begin/End Freeway - Josselyn Cyn Rd	2-Lane Highway	EB	C/D	983	89.9	E	734	79.8	D

Notes:
1. Freeway segment LOS based on density in passenger cars per mile per lane (pc/mi/ln).
2. Two-Lane Highway segment LOS based on Percent Time Spent Following (PTSF).
3. Multilane Highway segment LOS based on density in passenger cars per mile per lane (pc/mi/ln).
4. LOS = Level of Service
5. LOS highlighted in red indicates segment operating below level of service standard.

2.5 Existing Bicycle, Pedestrian, and Transit Facilities

Bicycle Facilities

There are three basic types of bicycle facilities. Each type is described below:

Bike path (Class I) - A separate right-of-way designed for the exclusive use of cyclists and pedestrians, with minimal crossings for motorists.

Bike lane (Class II) - A lane on a regular roadway, separated from the motorized vehicle right-of-way by paint striping, designated for the exclusive or semi exclusive use of bicycles. Bike lanes allow one-way bike travel. Through travel by motor vehicles or pedestrians is prohibited, but crossing by pedestrians and motorists is permitted.

Bike route (Class III) - Provides shared use of the roadway, designated by signs or permanent markings, and shared with motorists.

Highway 68 is classified as a Caltrans Bike Route in the TAMC Monterey County 2011 Bike Map. The segment of Highway 68 in the study area currently has paved shoulders of varying widths that accommodate bicycles. Highway 68 is classified in the TAMC Bicycle and Pedestrian Master Plan (December 2011) to be a Class II bike facility with bike lanes in the future. Bicycle Network Maps from the TAMC Bicycle and Pedestrian Master Plan are included in **Appendix K**.

Bicycle facilities are provided sporadically on the other study roadways. The only Class II bike lanes are provided on Garden Road (Fairground Road to Olmsted Road) and Canyon Del Rey Road (east of Fremont Street to Highway 68). Two bike storage containers are provided for public use at the Airport terminal's east second level entrance. No other bicycle facilities are present near the Airport.

Pedestrian Facilities

Pedestrian facilities generally include sidewalks, crosswalks, and pedestrian signals. There is not a significant amount of foot-traffic near the Project and therefore sidewalks are not provided along Highway 68. Sidewalks are provided along parts of Olmsted Road near the airport surface parking area opposite the current terminal building and on Fred Kane Drive along the frontage of the current terminal building. There are no continuous pedestrian sidewalks/pathways to the airport terminal area from outside of the airport. Sidewalks are not provided on Canyon Del Rey Boulevard (Highway 218) between Fremont Street and Highway 68 or along many of the other intersecting roadways on Highway 68 east of the airport. Further away from the project site, there are sidewalks along parts of Garden Road west of Olmsted Road, on Canyon Del Rey Boulevard (Highway 218) in Seaside, and along Fremont Street[9] and much of Airport Road in Monterey. Crosswalks and pedestrian signal phasing are provided at all the signalized study intersections.

Transit Facilities

Monterey-Salinas Transit (MST) provides fixed-route bus service in Monterey County and Peninsula cities. Lines 7, 56 and 93 provide service to the airport terminal via Highway 68 and Olmsted Road. Line 7 provides service between Monterey and Del Rey Oaks, Line 56 traverses between Salinas and Monterey, and Line 93 travels between downtown Monterey and the Ryan

[9] The *North Fremont Specific Plan* is a guide for future mixed-use development along North Fremont Street between Highway 1 and Canyon Del Rey Boulevard (Highway 218). In addition to establishing architectural design standards and guidelines, the plan encourages the implementation of bicycle, pedestrian, and transit improvements, which will be implemented as development occurs along the corridor.

Ranch Business Park. However, these three lines only operate during limited times of day. Line 7 operates only four times per day on weekends only, Line 56 operates only three times per day on weekdays only, and Line 93 provides hourly and bi-hourly service on weekdays only.

Various transit lines also service the area in the vicinity of Airport Road. Line 94 provides service between Carmel and Sand City via Airport Road, and has bus stops in each direction of Euclid Avenue between Airport Road and Casanova Avenue. However, this route only services the area during the late morning and mid-afternoon. Lines 11, 18, and three Jazz express buses (Lines Jazz A, Jazz B, and Jazz C) provide more regular transit service between Sand City/Marina and Monterey. All these lines traverse N. Fremont Street between Airport Road and Casanova Avenue and provide either limited weekday or daily hourly service. Bus stops for these routes are located near the N. Fremont Street intersections with Airport Road and Ramona Avenue. To encourage the use of alternative fuel vehicles, the airport has three Level 2 electric vehicle (EV) charging stations which are in the customer parking lots. One of these charging stations is free of charge.

2.6 Existing CONA Neighborhood Conditions

The Casanova Oak Knoll neighborhood in the City of Monterey (referred to as the CONA neighborhood) is located northwest of the Monterey Regional Airport and is bounded by N. Fremont Street to the north, Casanova Avenue to the east, and Airport Road-Euclid Avenue to the west and south. Access to the neighborhood is provided via Fairground Road, Airport Road, Ramona Avenue, and Casanova Avenue.

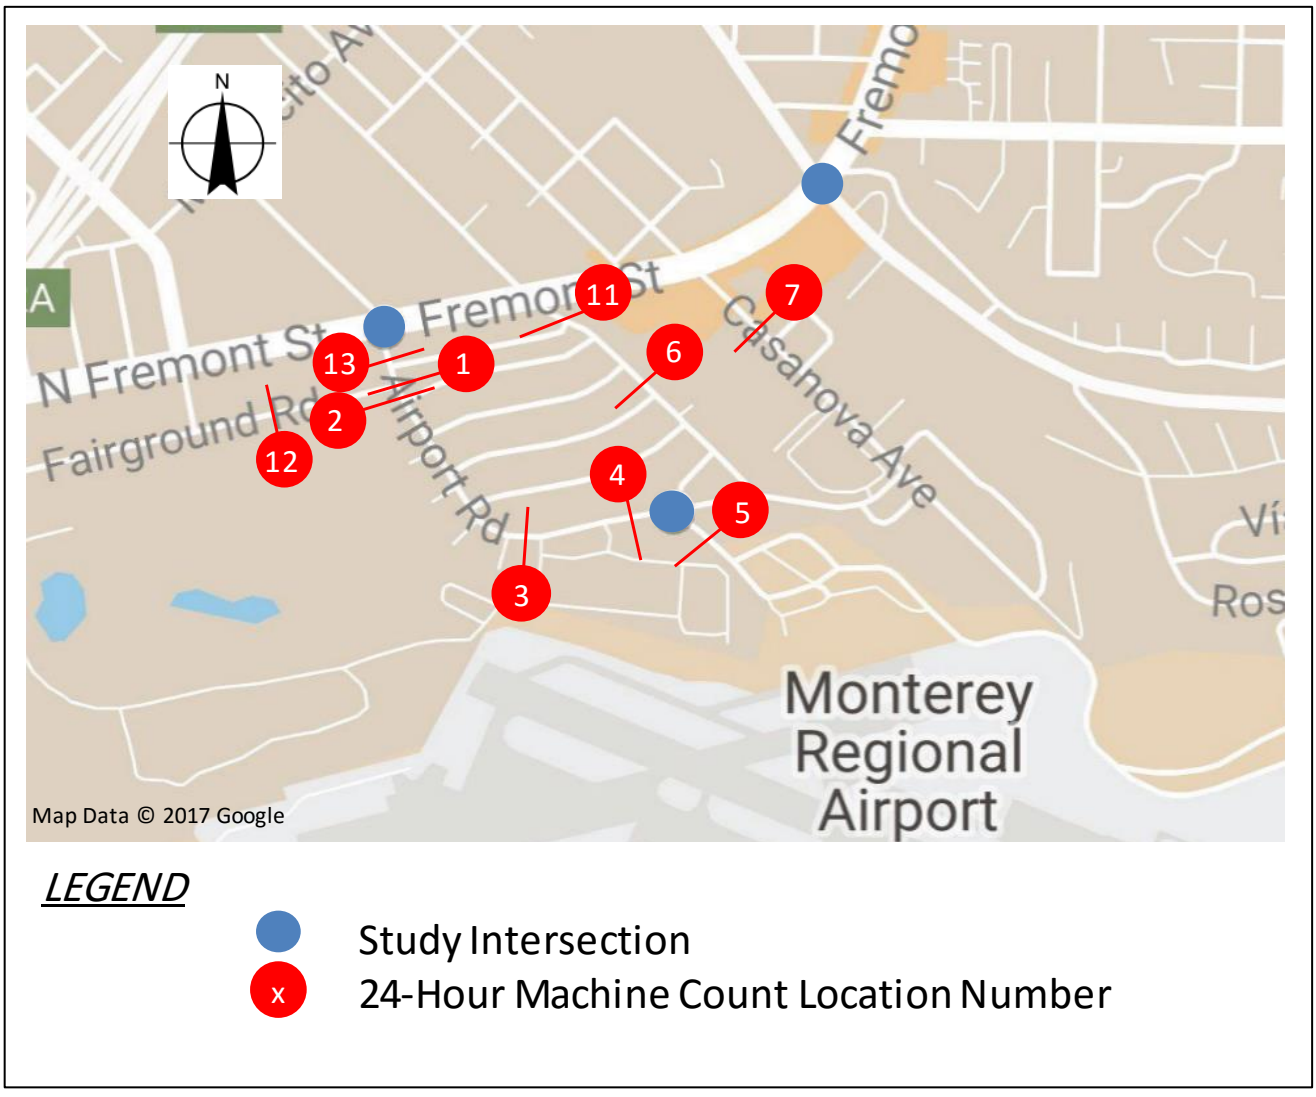
Although the CONA neighborhood is primarily residential, it is adjacent to various non-residential land uses that also generate traffic within the neighborhood. These land uses include the Monterey County fairgrounds, the naval research and meteorological center, and an industrial / commercial area in the northwest corner of the Airport. A map showing the neighborhood street system, the estimated number of residential units in the neighborhood, and the locations of primary adjacent land uses is included in **Figure 7**.

Figure 7: Casanova Oak Knoll Neighborhood Street System and Land Uses

Data Collection

Twenty-four-hour machine tube counts were conducted at selected locations in the CONA study area in November 2016 and February, May and June 2017. The 24-hour counts were conducted to identify various traffic characteristics within the neighborhood, including the degree of cut-through and commercial vehicle traffic, average vehicular speeds, and to assess the Project's potential impacts to the CONA neighborhood based on the Traffic Infusion on Residential Environment (TIRE) concept discussed in Section 4.1.7. A map showing the locations of the tube counts is shown in **Figure 8**. A summary of the 24-hour traffic count data is included in **Appendix L**. The 24-hour tube counts were used to determine the weekday (i.e., Tuesday, Wednesday, Thursday) average daily traffic (ADT) volumes in the CONA study area.

Figure 8: Twenty-Four-Hour Tube Count Locations



Daily Traffic Volumes

The general commute pattern in the CONA neighborhood tends to be heavier westbound in the morning and eastbound in the afternoon/evening. When motorists typically take the same route in the morning as they do in the afternoon/evening, the daily directional split is close to 50/50. The daily directional split of traffic on Fairground Road and Airport Road (north of Fairground Road) is approximately 60% eastbound/northbound and 40% westbound/southbound (see Locations #1, #12 and #13 in **Appendix L**). This is primarily due to higher eastbound/northbound traffic volumes between 12:00 p.m. and 5:00 p.m. The traffic pattern indicates that a considerable number of motorists take Fairground Road to Airport Road to N. Fremont Street in the afternoon/evening but do not use the same route in the morning. This could be due to motorists using Fairground Road and N. Fremont Street to avoid congestion on northbound Highway 1 in the afternoon/evening.

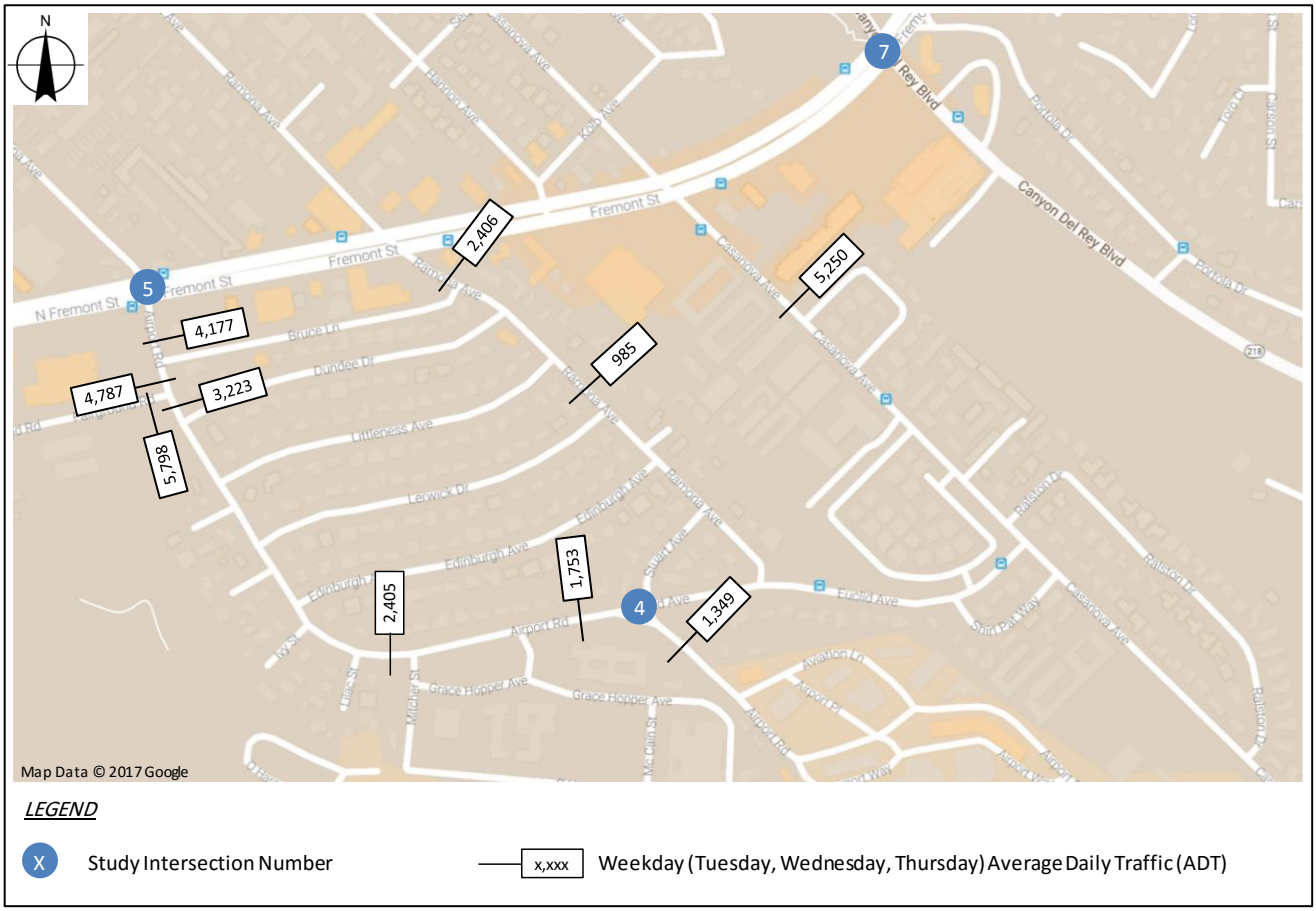
The daily traffic volumes collected in November 2016 on Casanova Avenue (Location #7) were significantly higher in the northbound direction than in the southbound direction (60% northbound, 40% southbound). In May 2017, to provide a check of the November 2016 data, the counts on Casanova Avenue (Location #7) were re-counted, and to provide additional information, supplemental counts were also collected at Airport Road south of Fairground Road (Location #2), Ramona Avenue north of Bruce Lane (Location #11), Fairground Road west of Airport Road (Location #12) and Airport Road north of Bruce Lane (Location #13).[10]

The daily directional split of the May 2017 counts on Casanova Avenue (Location #7) were significantly higher in the southbound direction than in the northbound direction (64% southbound, 36% southbound). Therefore, an additional 24-hour machine tube count was conducted on Casanova Avenue (Location #7) in June 2017. The June 2017 machine tube count on Casanova Avenue (Location #7) was verified with video data collection. The daily directional split of the June 2017 counts was 51/49.

The weekday (Tuesday, Wednesday, and Thursday) Average Daily Traffic (ADT) volumes in the CONA neighborhood are shown in **Figure 9**. For locations that were counted multiple times, the average of all the weekday (Tuesday, Wednesday, Thursday) counts are presented. The raw 24-hour segment count data is included in **Appendix M**.

[10] Prior counts (February 2017) were conducted on Casanova Avenue and Ramona Avenue, but due to ongoing construction activities at the time of the counts, they were determined to be not representative of actual conditions and, therefore, were not used as part of the analysis.

Figure 9: CONA Neighborhood Weekday Average Daily Traffic (ADT) Volumes



Cut-Through Traffic

At the request of the CONA community, the study considered cut-through traffic as part of the analysis. Cut-through traffic is traffic that does not have an origin or destination within the subject area. Residents in the CONA neighborhood have reported the occurrence of cut-through traffic, particularly on Bruce Lane and Dundee Drive, which ostensibly occurs due to drivers attempting to avoid congestion on N. Fremont Street. Based on the ADT counts, it does appear that some degree of cut-through traffic occurs in the neighborhood. Although it is difficult to quantify in a precise way, based on the ADTs and the land uses in the area, the amount of cut-through traffic in the neighborhood appears to be approximately 1,000 vehicles per day. It should be noted that the cut-through traffic is not a result of the businesses on the Airport property. Traffic going to and from the Airport property on Airport Road has its origin and/or destination within the subject area and is therefore not cut-through traffic. In addition, the volumes of cut-through traffic are included in the existing traffic counts. Therefore, the impacts associated with cut-through traffic have been considered as part of this analysis.

Percentage of Traffic Attributable to Airport Property

The Airport property on Airport Road south of Euclid Avenue is occupied by non-aviation facilities that provide a revenue stream to the Airport. The businesses in this area include self-storage, U-Haul and automotive services.

The weekday ADT on Airport Road south of Euclid Avenue was 1,349 vehicles per day. The distribution of traffic from the Airport property traveling to/from the north, east and west of the Airport Road / Euclid Avenue intersection was estimated based on the patterns of the peak hour traffic volumes. On average, about 23% of the traffic within the CONA neighborhood is attributable to the businesses on the Airport property. The ADTs at various locations within the CONA neighborhood and the relative percentage of traffic attributable to the Airport property is summarized in **Table 4**.

Table 4: Percentage of Traffic Attributable to Airport Property

	Road Segment	Weekday ADT	Airport Property Weekday ADT	Airport Property %
1	Airport Road North of Fairground Road	4,787	750	16%
2	Airport Road South of Fairground Road	3,223	750	23%
3	Airport Road West of Mitcher Street	2,405	750	31%
4	Airport Road West of Euclid Avenue	1,753	750	43%
6	Ramona Avenue South of Littleness Avenue	985	205	21%
7	Casanova Avenue North of Melway Circle	5,250	394	8%
13	Airport Road North of Bruce Lane	4,177	750	18%
	Average of All Segments			**23%**

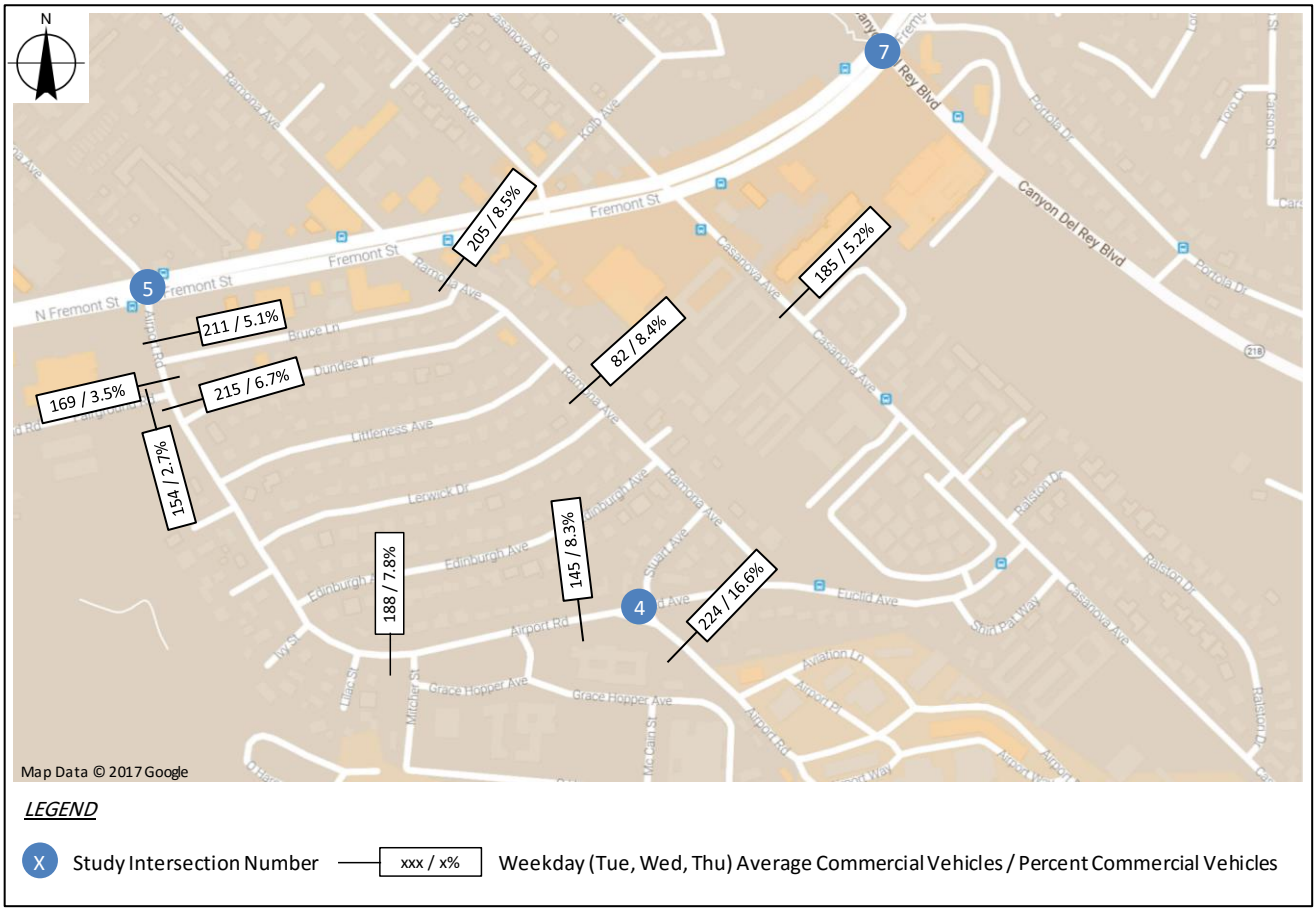
It should be noted that some traffic from the Airport property likely uses Fairground Road and does not reach Segments 1 and 13. Thus, the percentages for Segments 1 and 13 (i.e., 16% and 18%) can be considered conservatively high.

Commercial Vehicle Traffic

The traffic volume data collection also included vehicle classification counts. **Figure 10** depicts the average weekday commercial vehicle ADT volumes in the neighborhood. The term “commercial vehicles” refers to both vehicles with more than 3 axles (including larger trucks and vehicles pulling trailers) and larger two-axle trucks, such as delivery trucks and box trucks.

The number of commercial vehicles on Airport Road south of Euclid Avenue (224) is higher than on Airport Road west of Euclid Avenue (145). This indicates that commercial vehicles entering and exiting the industrial/commercial area on Airport Road south of Euclid Avenue are using Ramona Avenue and Casanova Avenue in addition to Airport Road. Based on the number of average daily commercial vehicles on Airport Road south of Euclid Avenue, Airport Road west of Euclid Avenue, Casanova Avenue north of Melway Circle, and Ramona Avenue between Littleness Avenue and Lerwick Drive, approximately half of the commercial vehicles in the neighborhood are attributable to the Airport property.

Figure 10: CONA Neighborhood Weekday Average Daily Commercial Vehicle Traffic



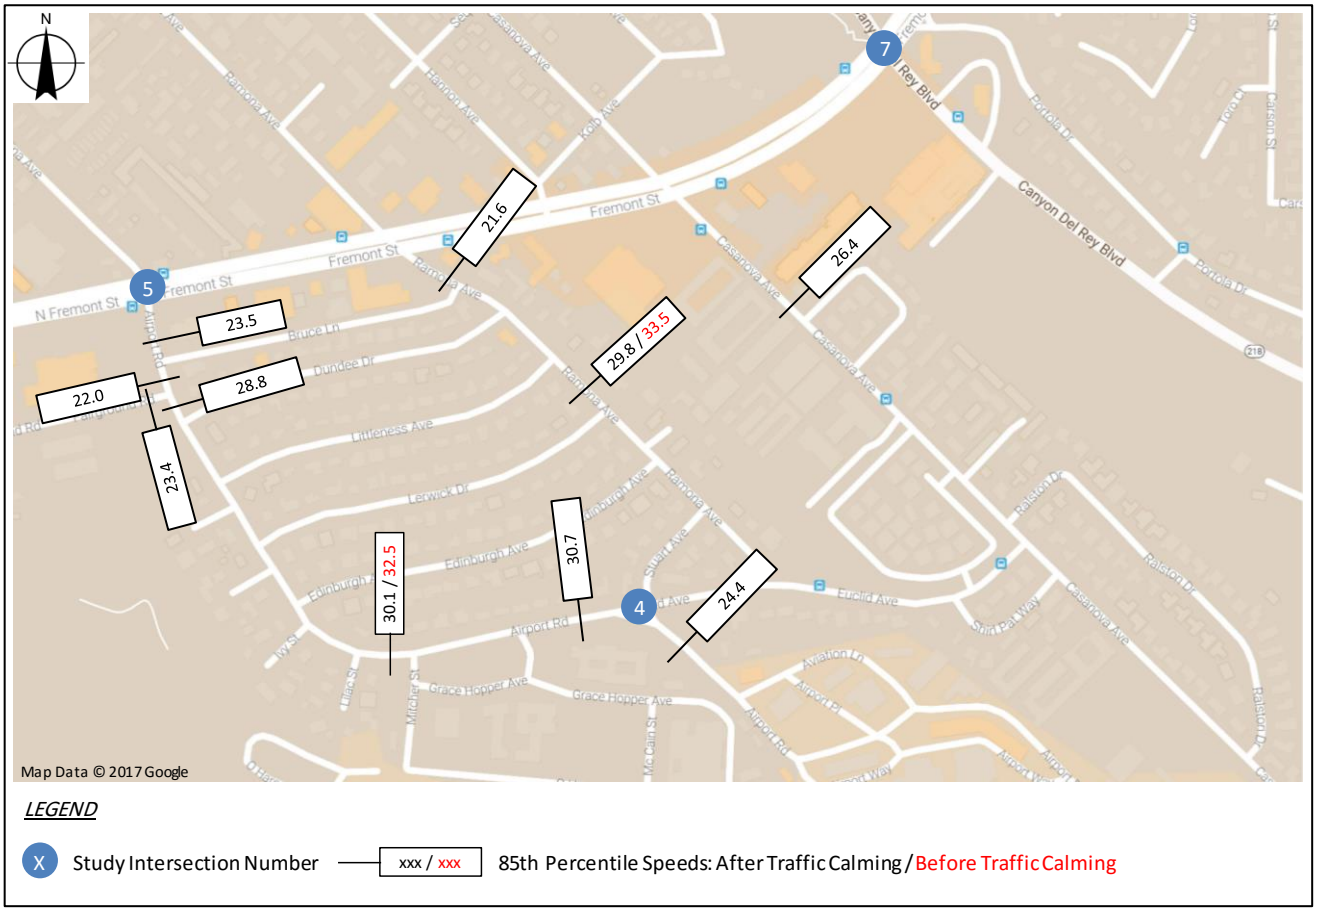
Vehicle Speeds

Residents in the CONA neighborhood have reported the occurrence of speeding, particularly on Casanova Avenue. In addition to the traffic volume and vehicle classification counts, the traffic counts also included a vehicle speed survey. **Figure 11** depicts the weekday average 85th percentile speeds (which are typically used to determine speed limits). The current posted speed limit in the neighborhood is 25 miles per hour (mph). Following the *Casanova Oak Knoll Neighborhood Traffic Calming Plan* (Pat Noyes & Associates, February 2002), the City of Monterey implemented a series of traffic calming measures in the CONA neighborhood. These measures included partial medians, curb extensions, a partial barrier and pavement treatments.

On average, the current 85th percentile speeds on Airport Road near Fairground Road and N. Fremont Street are just below the posted speed limit of 25 mph. The 85th percentile speeds on Airport Road west of Euclid Avenue and on Ramona Avenue south of Littleness Avenue are on average about 5 mph above the posted speed limit of 25 mph.

The current 85th percentile speeds were compared to those in the 2002 *Traffic Calming Plan*. At the two similar study locations, the 85th percentile speeds are on average 3 mph lower than when studied in 2002. This suggests that the traffic calming improvements have had a small but measurable effect on vehicle travel speeds in the CONA neighborhood.

Figure 11: CONA Neighborhood Weekday Average 85th Percentile Speeds



Traffic Calming

The City of Monterey has its own traffic calming policy, the *City of Monterey Neighborhood Traffic Calming Program,* adopted January 15, 2013. The goals of the policy are to improve resident "sense of well-being" about their neighborhood street, adopt traffic calming plans for all city neighborhoods, and be responsive to all neighborhood requests for traffic calming. The plan establishes a consistent process for evaluating the need for traffic calming across the city, including a review of the proposed plan to minimize its effect on emergency vehicles (e.g., fire, ambulance, etc.) and input and approval by the neighborhood residents through a collaborative public input process. All traffic calming plans must be approved and adopted by the City Council prior to implementation. Funding for traffic calming improvements are through the City's Neighborhood Improvement Program, grants, or other sources.

Types of traffic calming allowed in the plan include static signs, speed feedback signs, medians, street narrowing, textured pavement, turn restrictions, roundabouts, and full and partial street closures. Speed humps and stop signs are not allowed as traffic calming measures in the City of Monterey.

3 Project Timeframe and Alternatives

This section includes a description of the various Project alternatives and a discussion of Project access and internal circulation.

3.1 Project Timeframe

Project components include short-term and long-term actions and levels of development. Short-term Project components are expected to occur within approximately 10 years and long-term Project components are expected to occur within approximately 20 years.

3.2 Project Alternatives

The EIR addresses two road network alternatives, which are referred to as the "Proposed Project" and the "Alternative 1 Project". For the purposes of this analysis, this study focuses on the traffic that would be generated by the short-term and long-term actions and potential land development scenarios associated with the Airport Master Plan (AMP). Actions that would not generate additional traffic, such as increasing runway-taxiway separation and closing Taxiway K, redevelopment of the existing northwest commercial/industrial area with similar land intensity, and relocation of the commercial terminal building and apron, are only briefly described, as they would not cause potential traffic impacts.

The road network under Proposed Project Short-Term conditions is the existing road network, while the road network under Alternative 1 Project Short-Term conditions includes the construction of a new roadway, referred to as North Side Road, that would extend from Del Rey Gardens Drive in Del Rey Oaks (off Highway 218) to the northeast side of the Airport. The North Side Road would provide access to the north side of the Airport and would allow access through the CONA neighborhood from east of Gate 22 to be discontinued.

The Alternative 1 Project road network would avoid adding new trips, and reduce existing Airport-generated traffic, through the CONA neighborhood. Therefore, the Alternative 1 Project has the potential to improve the quality of life of the residents in the CONA neighborhood.

Trips generated by the Project are analyzed under the following Project scenarios:

3.2.1 Proposed Project Short-Term

This Project scenario includes the relocation of 44 General Aviation (GA) hangars from the southwest side of the Airport to the north side of the Airport and the construction of up to 7 new GA hangars on the north side of the Airport. Current access to the north side of the Airport is via Airport Road through the CONA neighborhood.[11] As a result, the relocation of the 44 GA hangars will result in a redistribution of traffic, reducing traffic on the south side of the Airport and increasing traffic on Airport Road through the CONA neighborhood. The construction of 7 new GA hangars would also increase traffic on Airport Road through the CONA neighborhood.

[11] Under the Proposed Project (short term) a temporary ARFF building would also be located on the north side for a period of up to six years until a new permanent ARFF building could be constructed in the location of the existing commercial terminal building. Although these temporary trips are not included in the traffic LOS analysis, related noise and other potential land use compatibility issues are addressed in the appropriate sections of the EIR.

3.2.2 Alternative 1 Project Short-Term

This scenario includes construction of the North Side Road. The north side of the Airport currently contains six Port-a-Port T-hangars and the Monterey Navy Flying Club hangar which are accessed via Airport Road through the CONA neighborhood. With the construction of the North Side Road, traffic would instead access the six Port-a-Port T-hangars and the Monterey Navy Flying Club via the North Side Road from Del Rey Gardens Drive and Highway 218.

This Project scenario also includes the relocation of the 44 GA hangars from the southwest side of the Airport to the north side of the Airport, the construction of 7 new GA hangars on the north side of the Airport, and the relocation of the Airport Rescue and Firefighting (ARFF) building from the south side of the Airport to the north side of the Airport. These actions would result in a redistribution of traffic, reducing traffic on the south side of the Airport and increasing traffic on Highway 218 and Del Rey Gardens Drive.

3.2.3 Proposed Project Long-Term

This scenario includes construction of the North Side Road, the redistribution of the six Port-a-Port T-hangars and Monterey Navy Flying Club traffic, the redistribution of the 44 GA hangars traffic, and the construction of up to 7 new GA hangars. In addition, this scenario evaluates the ultimate construction of 106 GA hangars, 400,000 square feet of General Light Industrial, and 325,000 square feet of Office Park development on the north side of the Airport; and 10,000 square feet of High-Turnover Restaurant, 45,000 square feet of Medical-Dental Office, and 94,000 square feet of General Office development on the south side of the Airport. Under this scenario, the permanent ARFF building would remain on the south side of the Airport.

3.2.4 Alternative 1 Project Long-Term

This scenario is the same as the Proposed Project Long-Term scenario with one exception. Under this scenario, the ARFF building would be permanently relocated to the north side of the Airport.

3.3 Project Access and Internal Circulation

Phases of the Project include the construction of a new terminal building, new parking facilities, and a new terminal loop road. Although these phases of the project are not expected to generate additional traffic, they will result in changes to access and circulation at the Airport.

The Airport is proposing to convert the Olmsted Road / Garden Road (#2) intersection to a roundabout. Currently a “T” intersection, a fourth (east) leg would be added to the intersection which would provide access to a new parking garage or surface parking lot and terminal loop road in front of the new Airport terminal. The two-lane terminal loop road would provide one-way counter-clockwise circulation around the surface parking lot, with dedicated turn pockets into the parking lot. The terminal loop road would also provide a 10-foot wide curbside pick-up/drop-off lane (390 feet), a curbside taxi lane (310 feet), and a bus turnout (65 feet).[12] Parking in front of the new terminal building would be provided in an approximate 720-space garage (Proposed Project) or an approximate 380 parking space surface lot (Alternative 1 Project).

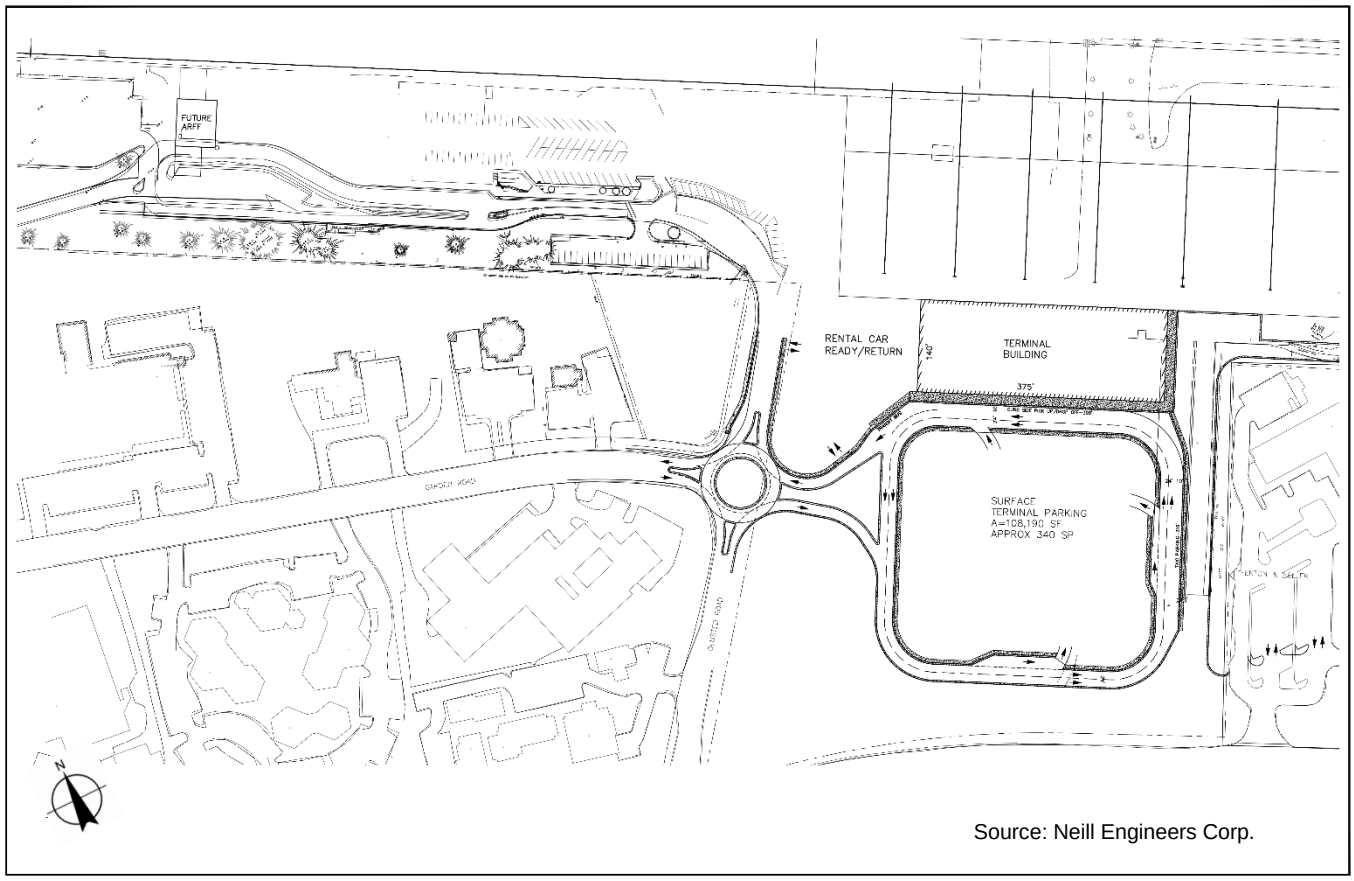
A rental car ready/return surface parking lot (approximately 110 parking spaces) is proposed just west of the new terminal building. Driveway access to the rental car ready/return lot would be north of the proposed Olmsted Road / Garden Road roundabout. This lot would supplement the existing rental car ready/return lot located west of the existing terminal building.

[12] Lengths of pick-up/drop-off, taxi and bus lanes are approximate.

Pedestrian facilities would be provided adjacent to the curbside bus, taxi, and drop-off/pick-up areas, as well as between the new terminal building and the rental car ready/return lot. Major pedestrian activities will occur between the terminal's surface parking lot and the new terminal building. A sidewalk around the perimeter of the terminal surface parking lot will enhance pedestrian safety between the surface parking lot and terminal building.

A conceptual layout of the proposed access and circulation is shown in **Figure 12**. Additional parking once the existing terminal building is removed would be provided along Fred Kane Drive, as needed, in surface lots and/or a parking garage. A Highway 68 frontage road is also planned east of Olmsted Road. This road would be either constructed as a loop road (Proposed Project) or as a cul-de-sac (Alternative 1 Project) (refer to **Figures 2** and **3**, respectively).

Figure 12: Conceptual Layout of Airport Terminal Access and Circulation



Source: Neill Engineers Corp.

4 Existing Plus Project Short-Term Traffic Conditions

This section describes traffic operations in the study area with the addition of Project traffic under the two short-term project alternatives, namely; Proposed Project Short-Term and Alternative 1 Project Short-Term traffic conditions.

4.1 Proposed Project Short-Term Traffic Conditions

4.1.1 Proposed Project Short-Term – Trip Generation, Distribution, and Assignment

The ITE *Trip Generation* manual does not contain appropriate trip generation rates for the General Aviation hangars. The trip generation rates for this land use were therefore developed based on actual gate counts at the Airport's existing hangar gates on the southeast ramp. The gate count data was collected between November 1 and December 31, 2016. The gate counts represent typical activity levels at the Airport and are therefore appropriate for use in developing the trip generation rates.

As discussed in Section 3.2.1, the Proposed Project Short-Term scenario includes a combination of actions and development that would reduce traffic at some locations and increase traffic at other locations within the study area. This scenario would result in a total net new trip generation of 10 daily trips, with 1 occurring during the AM peak hour (1 in, 0 out) and 2 occurring during the PM peak hour (1 in, 1 out). Details of the Proposed Project Short-Term trip generation are provided in **Table 5**.

The Project trips were assigned to the study intersections based on existing traffic and land use patterns in the study area. The Project trip distribution percentages are shown in **Figure 13**. The increases and reductions in trips from the relocated hangars were added to the new trips generated by the new hangars to obtain the Proposed Project Short-Term AM and PM peak hour trip assignments, which are shown in **Figures 14** and **15**.

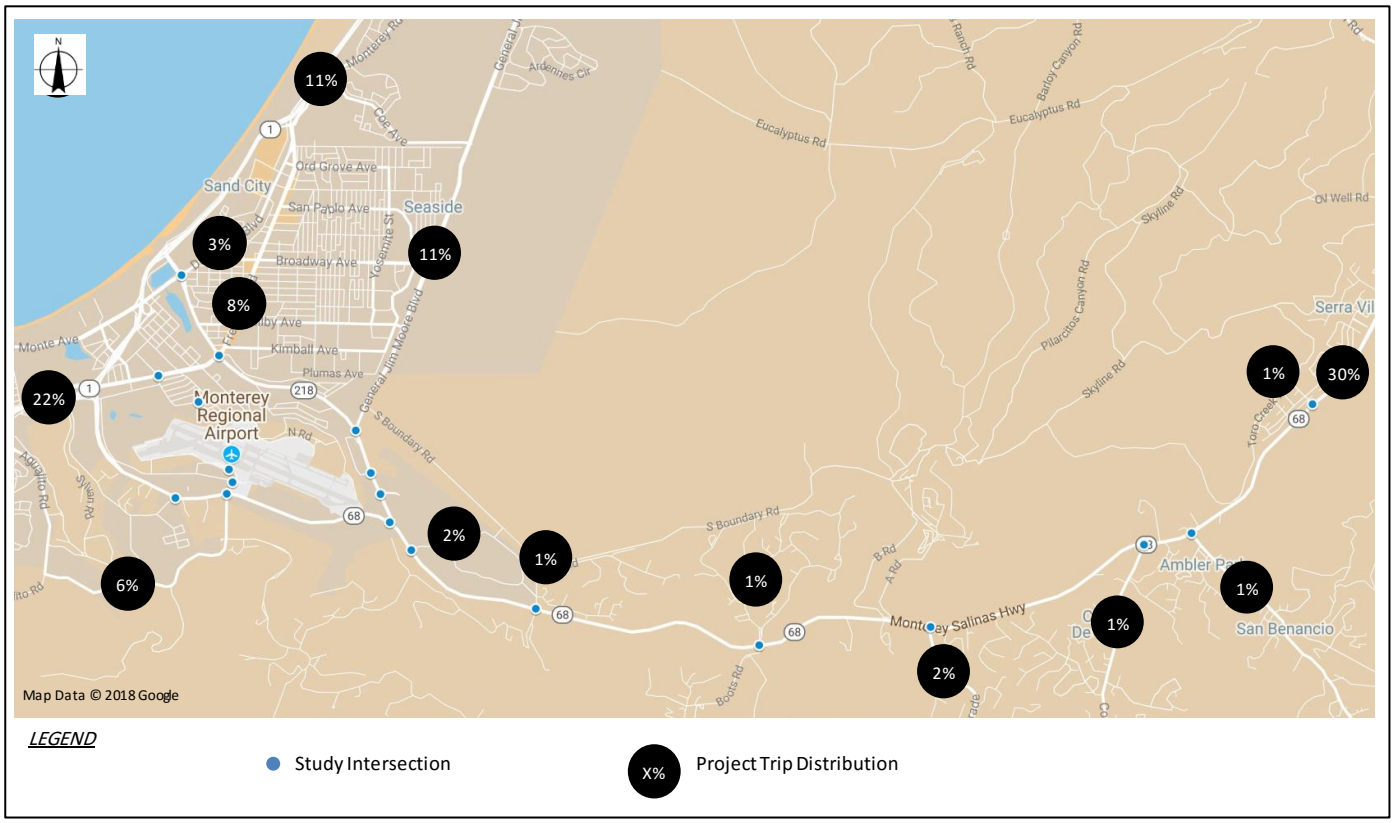
Table 5: Proposed Project Short-Term Trip Generation

Proposed Project Short-Term		WEEK DAY	WEEKDAY AM PK HR			WEEKDAY PM PK HR		
TRIP GENERATION RATES	ITE Code	DAILY RATE	PK HR RATE	% IN	% OUT	PK HR RATE	% IN	% OUT
Hangars (per unit)	N/A	1.41	0.17	83%	17%	0.32	45%	55%
TRIPS GENERATED BY AREA	Units / SF	DAILY TRIPS	PK HR TRIPS	TRIPS IN	TRIPS OUT	PK HR TRIPS	TRIPS IN	TRIPS OUT
North Side via CONA Neighborhood								
Relocated GA Hangars	44	62	7	6	1	14	6	8
New GA Hangars	7	10	1	1	0	2	1	1
South Side via Olmsted Road								
Relocated GA Hangars	-44	-62	-7	-6	-1	-14	-6	-8
Total Net New Generated Trips		**10**	**1**	**1**	**0**	**2**	**1**	**1**

Notes:

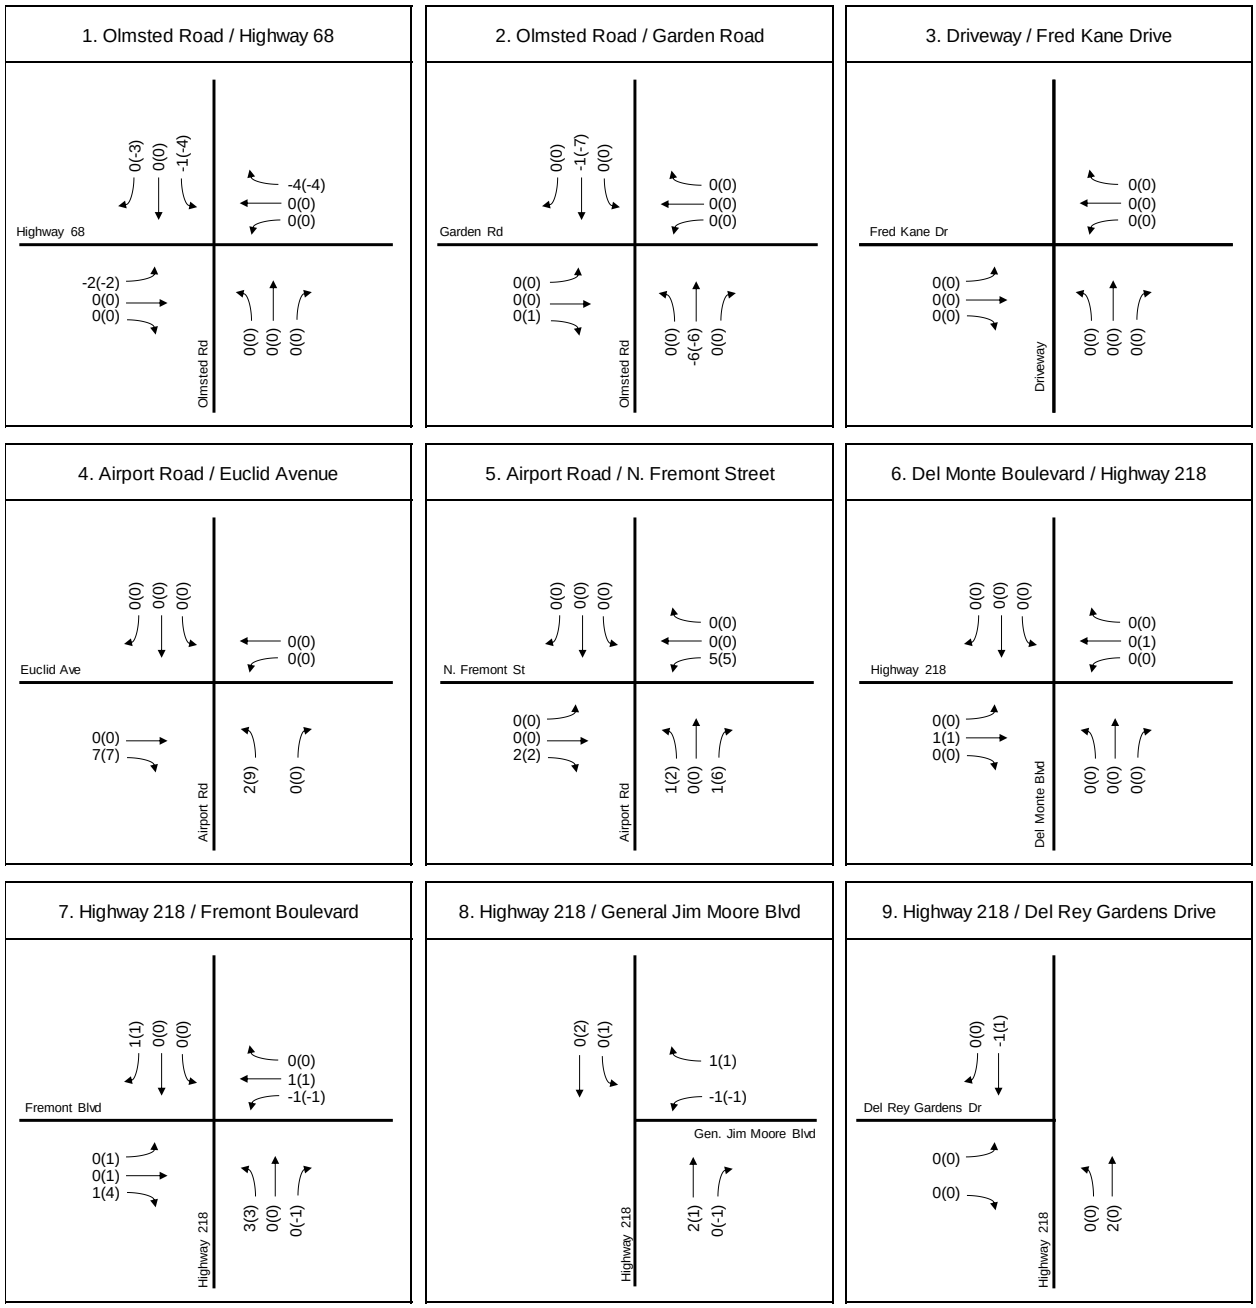
1. Trip generation rates for hangars based on gate counts at Monterey Regional Airport (November 1 - December 31, 2016).
2. Relocated trips in red are subtracted from their current access point and added to the north side via the CONA neighborhood.
3. The 44 hangars relocated from the south side are included in the 51 hangars on the north side.

Figure 13: Project Trip Distribution



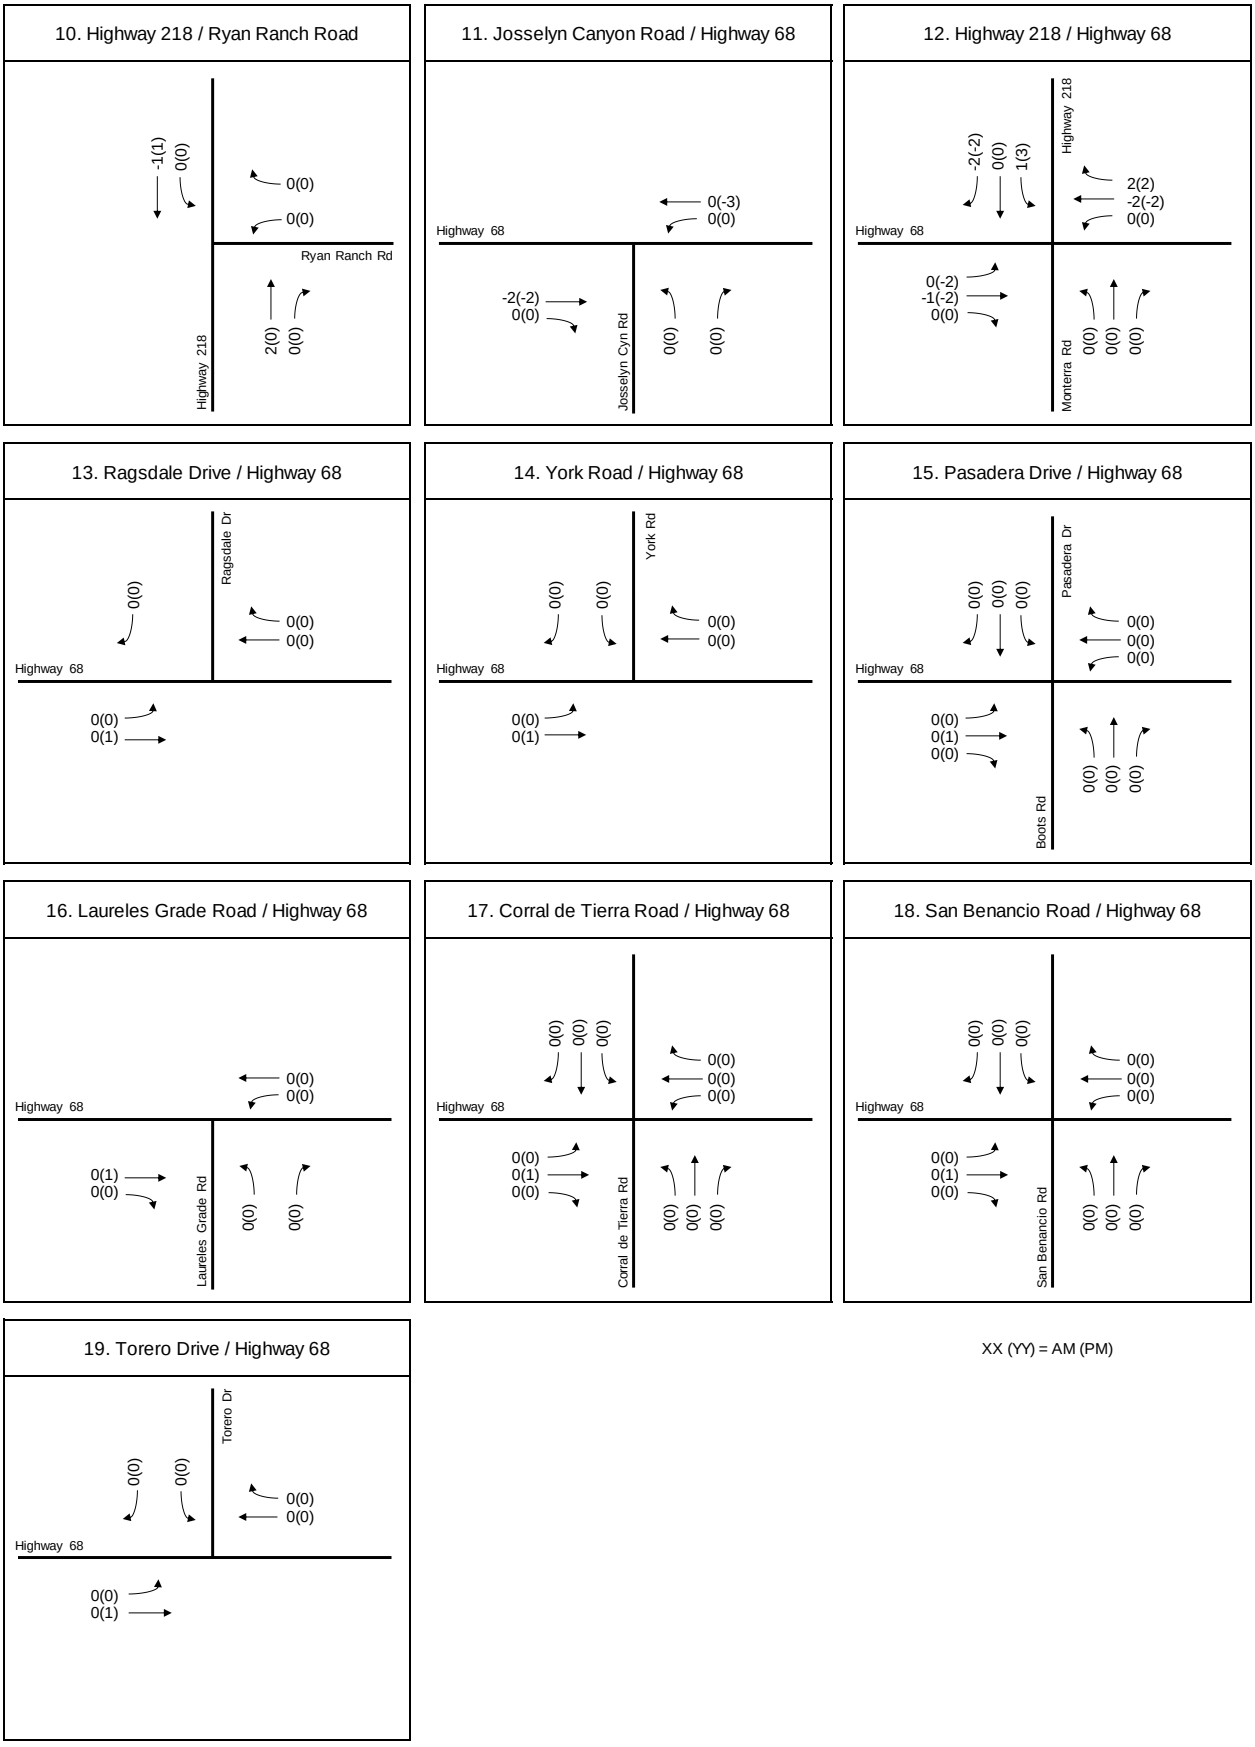
Note: As shown in **Figure 13**, approximately 39% of project trips are expected to travel from areas east of the Airport using Highway 68, 28% are expected to travel from the west or southwest (Monterey), and 33% are expected to travel from the north (Seaside, Sand City, or further north.)

Figure 14: Proposed Project Short-Term Trip Assignment (1 – 9)



XX (YY) = AM (PM)

Figure 15: Proposed Project Short-Term Trip Assignment (10 – 19)



4.1.2 Existing Plus Proposed Project Short-Term – Intersection Operations

The Proposed Project Short-Term trip assignments were combined with the Existing conditions traffic volumes to obtain Existing Plus Proposed Project Short-Term AM and PM peak hour traffic volumes, which are shown in **Figures 16** and **17**.

Based on the City of Monterey and Caltrans level of service standards, the following study intersections would operate deficiently under Existing Plus Proposed Project Short-Term traffic conditions (**Tables 6** and **7**):

Intersection #1 – Olmsted Road / Highway 68

Intersection #6 – Del Monte Boulevard / Highway 218

Intersection #7 – Highway 218 / Fremont Boulevard

Intersection #11 – Josselyn Canyon Road / Highway 68

Intersection #14 – York Road / Highway 68

Intersection #15 – Pasadera Drive / Highway 68

Intersection #17 – Corral De Tierra Road / Highway 68

Intersection #18 – San Benancio Road / Highway 68

Intersection #19 – Torero Drive / Highway 68

It should be noted that these intersections would also operate at deficient levels of service without the Project.

4.1.3 Existing Plus Proposed Project Short-Term – Road Segment Operations

As discussed in Section 2.4, the following road segments would operate deficiently under Existing traffic conditions. These segments would continue to operate deficiently under Existing Plus Proposed Project Short-Term conditions:

Segment #2 – Highway 68, from Begin/End Freeway to Josselyn Canyon Road

Segment #3 – Highway 68, from Josselyn Canyon Road to Olmsted Road

Segment #4 – Highway 68, from Olmsted Road to Highway 218

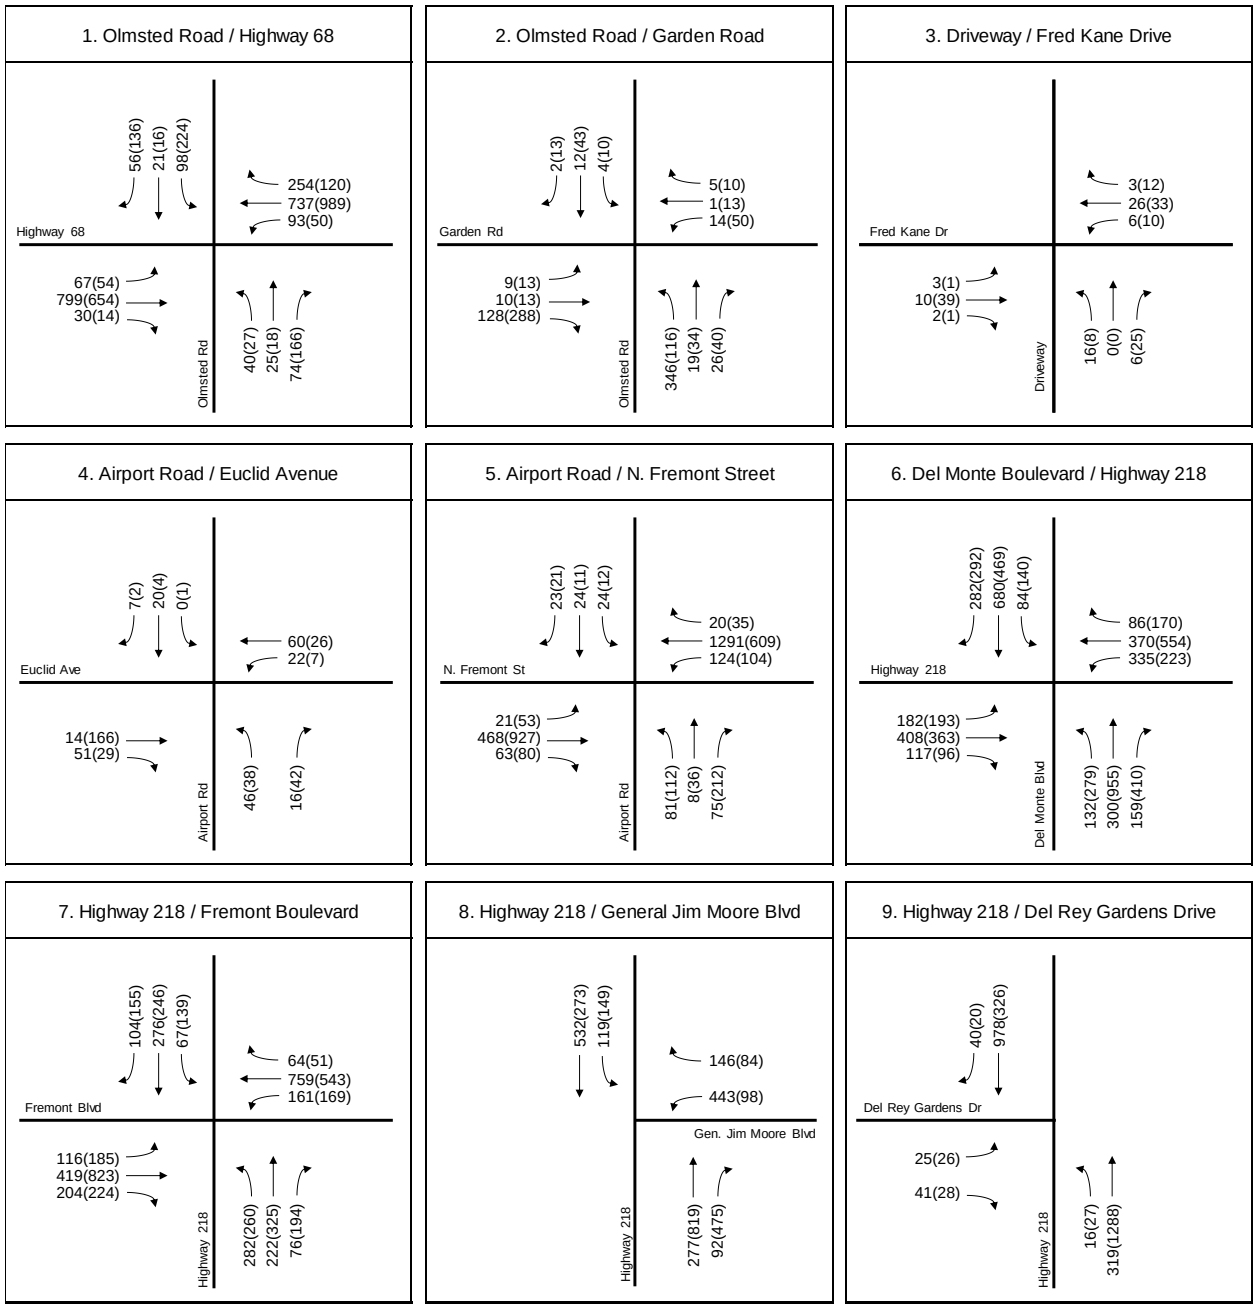
Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade

Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road

Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive

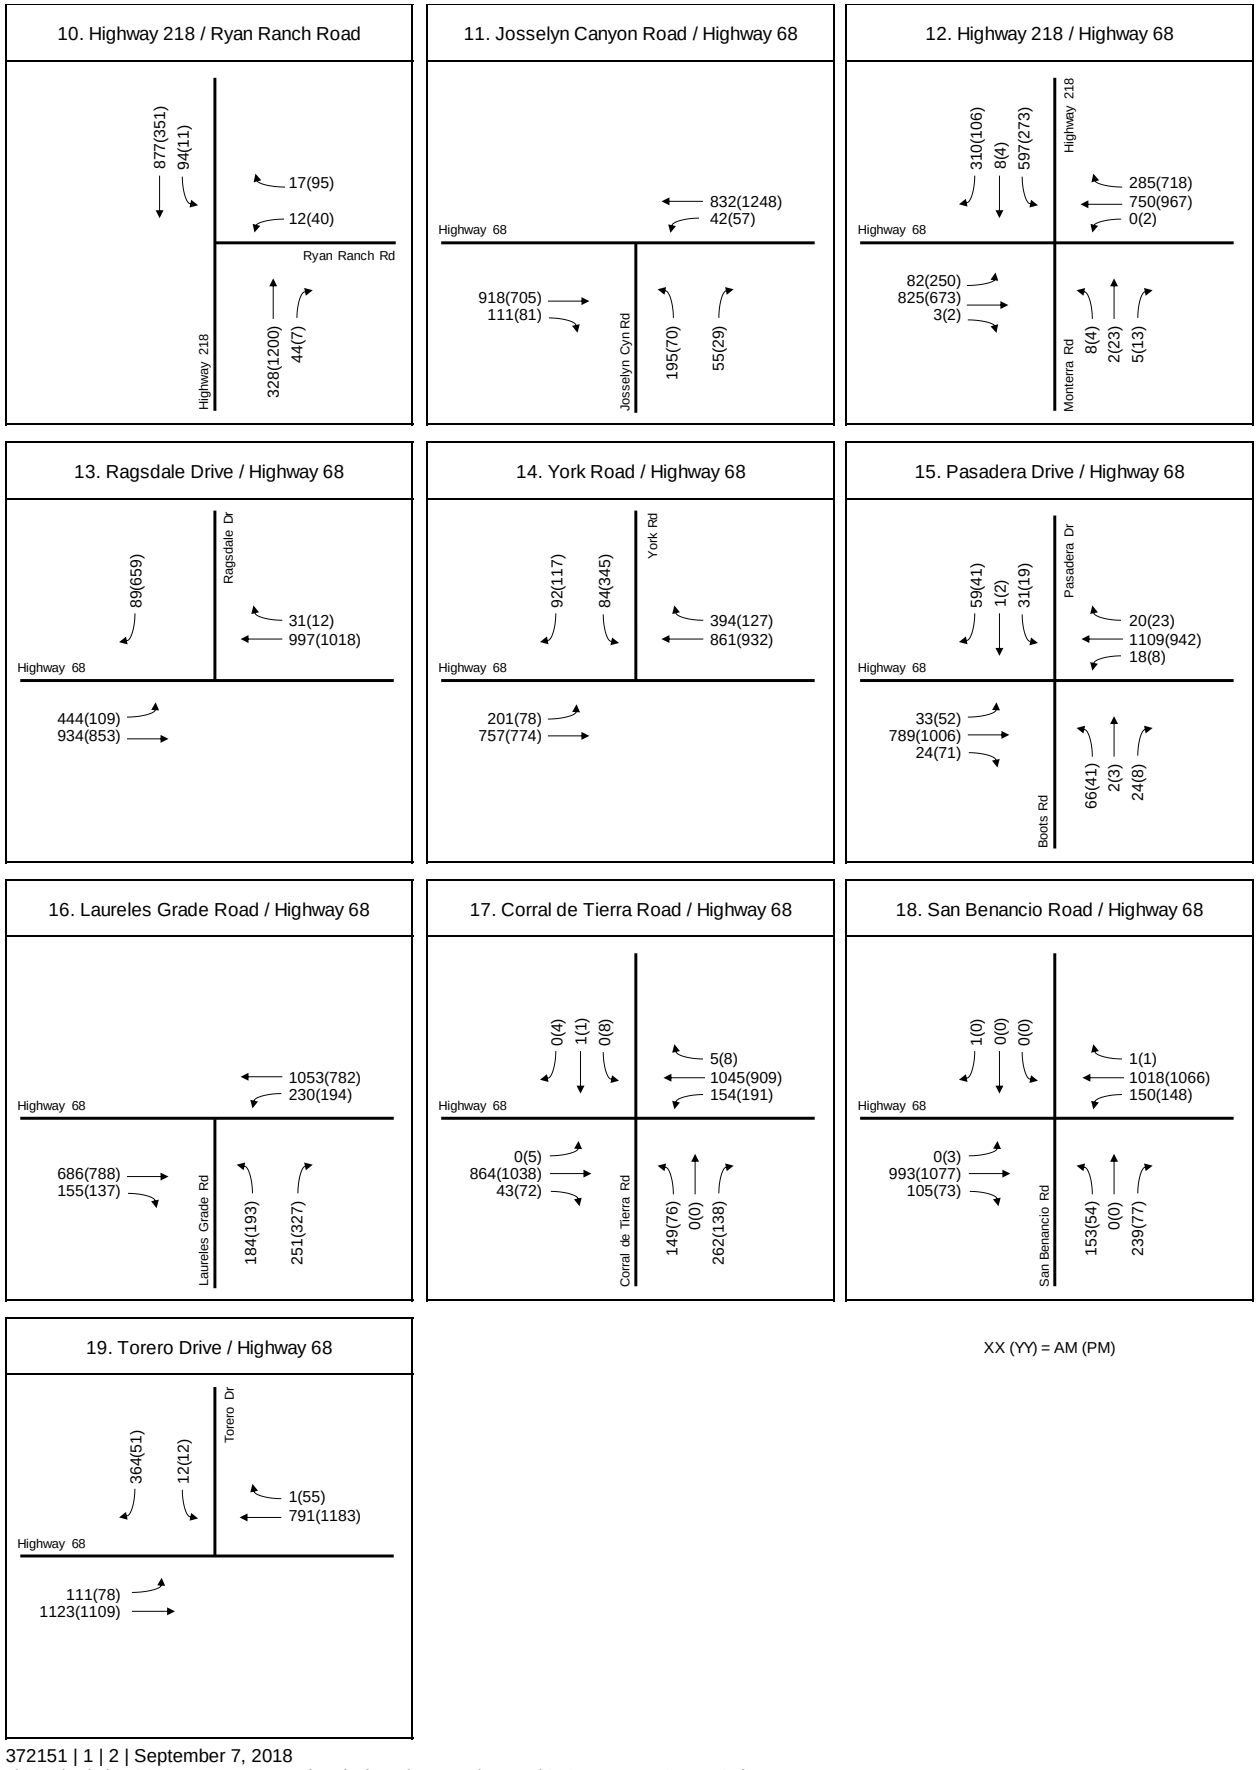
Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

Figure 16: Existing Plus Proposed Project Short-Term Volumes (1 – 9)



XX (YY) = AM (PM)

Figure 17: Existing Plus Proposed Project Short-Term Volumes (10 – 19)



4.1.4 Existing Plus Proposed Project Short-Term – Project Impacts

Based on the criteria for project impacts, the Project would have a significant impact at the following intersections under Existing Plus Proposed Project Short-Term conditions:

Intersection #6 – Del Monte Boulevard / Highway 218

Intersection #7 – Highway 218 / Fremont Boulevard

Intersection #14 – York Road / Highway 68

Intersection #17 – Corral De Tierra Road / Highway 68

Intersection #19 – Torero Drive / Highway 68

Based on the Caltrans impact criteria, the addition of a single project trip at an intersection that is operating deficiently can be considered an impact. Although intersections #1, #11, #15, and #18 (all Caltrans intersections) would also operate deficiently under Existing Plus Proposed Project Short-Term conditions (and under Existing conditions), the Project would not impact these intersections either because a) the redistribution of traffic that would occur with the relocation of the existing hangars would result in an overall reduction of traffic at the intersection or b) the Project is not expected to add traffic to the intersection during the peak hour that is operating deficiently. Under these circumstances, the Project would not trigger a significant impact under any of the applicable thresholds.

Based on the criteria for project impacts, the Project would have a significant impact on the following road segments under Existing Plus Proposed Project Short-Term conditions:

Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade

Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road

Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive

Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

4.1.5 Existing Plus Proposed Project Short-Term – Mitigation Measures

The improvements listed below are recommended to mitigate the Project's impacts under Existing Plus Proposed Project Short-Term conditions. As discussed at Draft EIR sections 4.16. and 5.5.16, and at Draft EIR Appendix N, the improvements, however, may not be feasible if disallowed by federal law; federal law states that airport revenues and Federal Aviation Administration (FAA) grant funds may not be used for purposes other than the capital or operating costs of the airport, the local airport system, or other local facilities owned or operated by the airport owner or operator that are directly and substantially related to the air transportation of passengers and property. These restrictions impact the Airport's ability to fund and implement off-airport mitigation measures. Now that the Airport has identified specific mitigation measures for Proposed Project cumulative impacts, it can make specific requests to the FAA, where appropriate, for it to allow funding of off-airport mitigation measures.

At this time, however, because the Airport does not currently have a determination from the FAA that funding for any off-airport mitigation improvements will be allowed, the following mitigation measures are considered infeasible:

Intersection #6: Del Monte Boulevard / Highway 218 – Mitigation #1

1. Add 2nd Northbound Del Monte Boulevard Left-Turn Lane

Implementation of this improvement would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of this improvement, based on the relative number of project trips it would add to the intersection (1 AM and 2 PM peak hour trips).

However, this improvement would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement this improvement. In addition, even with the Project's fair-share contribution, there is no guarantee that there would be sufficient funding available to implement this improvement. This impact could be mitigated by constructing the left turn lane; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection # 7: Highway 218 / Fremont Boulevard – Mitigation #2

1. Add 2nd Northbound Highway 218 Left-Turn Lane

Implementation of this improvement would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of this improvement, based on the relative number of project trips it would add to the intersection (5 AM and 9 PM peak hour trips).

However, this improvement would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement this improvement. In addition, even with the Project's fair-share contribution, there is no guarantee that there would be sufficient funding available to implement this improvement. This impact could be mitigated by constructing the left turn lane; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection # 14: York Road / Highway 68 – Mitigation #3

1. Convert intersection to a roundabout

Conversion of this intersection to a roundabout, as proposed in TAMC's *SR 68 Scenic Highway Plan* study, would reduce the Project's impact (1 PM peak hour trip) to a less than significant level. Per the TAMC website, Measure X sales tax funds have been dedicated to the *SR 68 Scenic Highway Plan*, which is also a candidate for federal infrastructure funding and state funding from SB 1 programs. This impact could be mitigated by constructing the roundabout; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #17: Corral De Tierra Road / Highway 68 – Mitigation #4

1. Convert intersection to a roundabout

Conversion of this intersection to a roundabout, as proposed in TAMC's *SR 68 Scenic Highway Plan* study, would reduce the Project's impact (1 PM peak hour trip) to a less than significant level. Per the TAMC website, Measure X sales tax funds have been dedicated to the SR 68 Scenic Highway Plan, which is also a candidate for federal infrastructure funding and state funding from SB 1 programs. This impact could be mitigated by constructing the roundabout;

however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #19: Torero Drive / Highway 68 – Mitigation #5

1. Convert intersection to a roundabout

Conversion of this intersection to a roundabout, as proposed in TAMC's *SR 68 Scenic Highway Plan* study, would reduce the Project's impact (1 PM peak hour trip) to a less than significant level. Per the TAMC website, Measure X sales tax funds have been dedicated to the SR 68 Scenic Highway Plan, which is also a candidate for federal infrastructure funding and state funding from SB 1 programs This impact could be mitigated by constructing the roundabout; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Existing Plus Proposed Project Short-Term intersection levels of service (LOS) with mitigation are also summarized in **Tables 6** and **7**. Levels of service with the proposed roundabouts are identified by PI#1, PI#2, etc. (for Proposed Improvement #). The levels of service with the proposed roundabouts do not necessarily indicate the project has an impact at that location. Mitigated levels of service indicate locations where the project would have an impact, and are identified by M#1, M#2, etc. (for Mitigation #).

LOS calculation worksheets for signalized, stop-controlled, and roundabout-controlled intersections are included in **Appendix H**. Vehicle queue estimates are included as **Appendix I**.

Road Segments #6, #7, #8 and #9

The Proposed Project Short-Term is expected to add zero AM peak hour and one PM peak hour trip to segments #6 through #9. This will not be enough of an increase in traffic to affect traffic operations on these segments.

Table 6: Existing Plus Proposed Project Short-Term – Intersection LOS (1 – 9)

Scenario # →								1		2

					PM			*13.0*	*B*		*13.0*	*B*
19	Torero Drive	Highway 68	One-Way Stop	C/D	AM			*	F	0	*	F
					PM			111.3	F	1	111.3	F
					AM	*M#5*	*PI#10*	*16.4*	*C*		*16.4*	*C*
					PM			*12.4*	*B*		*12.4*	*B*

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).

2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).

3 LOS highlighted in red indicates intersection operating below level of service standard.

4 * = delay greater than 300 seconds.

5 LOS in bold box indicates project impact.

4.1.6 Existing Plus Proposed Project Short-Term – Bicycle, Pedestrian, and Transit Operations

The Airport supports bicycle use by Airport employees and the public by providing convenient, secure bicycle facilities on Airport premises. Two bike storage containers are currently available for public use at the terminal's east second level entrance.

As discussed in Section 3.3, the Project site plan includes pedestrian walkways adjacent to curbside bus, taxi, and drop-off/pick-up areas, as well as between the new terminal building and the rental car ready/return lot. A sidewalk around the perimeter of the terminal surface parking lot will enhance pedestrian safety between the surface parking lot and terminal building.

The Project site plan also includes a designated transit bus stop just west of the terminal building that is approximately 65 feet long.

The Proposed Project Short-Term is not expected to generate a significant amount of bicycle, pedestrian, or transit trips and will not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities. Since the Project will not decrease the performance or safety of such facilities, the Project will not impact the bicycle, pedestrian, or transit facilities in the study area.

4.1.7 Existing Plus Proposed Project Short-Term – CONA Neighborhood Conditions

As described in Section 3.2.1, the Proposed Project Short-Term includes the relocation of 44 hangars from the Airport's existing southeast General Aviation (GA) area to the north side GA area, and the addition of up to 7 new hangars to the Airport's north side GA area. Access to the relocated and new hangars would be via Airport Road and would add trips within the Casanova Oak Knoll (CONA) neighborhood. Specifically, the proposed project has the potential of adding traffic to the following residential streets in the CONA neighborhood:

- Airport Road
- Ramona Avenue
- Casanova Avenue
- Euclid Avenue

Based on the analysis and levels of service shown in **Table 6**, the study intersections within the CONA neighborhood (#4 and #5) currently operate at acceptable levels of service (LOS A and LOS B) and would continue to operate at acceptable levels of service with the Proposed Project Short-Term.

Although not based on City impact thresholds, the City of Monterey has indicated that use of the Traffic Infusion on Residential Environment (TIRE) index could add value to qualitatively assessing potential impacts to the residential neighborhood. Therefore, the following discussion is provided for informational purposes only.

The TIRE index is a measure of residents' perceptions of the effect of increased traffic on residential streets. The TIRE index is derived from a theory by D.K. Goodrich based on work by Appleyard of the University of California at Berkeley, and by Buchanan of the Ministry of Transport, England. TIRE is based on the theory that a given increase in traffic volume has a greater impact on the residential environment along a residential street with a low traffic volume than along a street with a high pre-existing volume. TIRE effects are separate from noise and air pollution impacts. TIRE represents the effect of traffic on the safety and comfort of human activities such as walking, cycling, and playing on or near a street and on the freedom to maneuver personal autos in and out of residential driveways.

The effect of adding project related traffic to the streets listed above was evaluated using the TIRE index. TIRE index values range from 0.0 and 5.0, with 0.0 representing the least effect of traffic on a residential street and 5.0 representing the greatest effect. A TIRE index of 3.0 typically represents the threshold at which the character of a residential street changes from a residential street to a traffic-carrying street. A change in the TIRE index of less than 0.1 would not be noticed by a resident, whereas a change of 0.1 or more would be noticeable to residents. More information regarding the TIRE index is provided in **Appendix N**.

Table 8 provides a summary of existing daily traffic carried by the seven study street segments. The volume of daily traffic on all study segments is equal to or exceeds a TIRE index value of 3.0. As shown in **Table 8**, the Proposed Project Short-Term would have no impact on the TIRE index of the study street segments, except for Airport Road south of Euclid Avenue. The TIRE index on Airport Road south of Euclid Avenue is expected to increase by 0.1 with the Proposed Project Short-Term, which indicates that the increase in traffic generated by the Proposed Project Short-Term may be noticeable to residents of the one residential unit on that study segment.

Table 8: TIRE Index Summary

	Street Segment	Existing Conditions		Project	Existing + Proposed Project Short-Term		Change in TIRE Index
		ADT	TIRE Index	ADT	ADT	TIRE Index	
1	Airport Rd between Fairground Rd and Dundee Dr	3,223	3.5	35	3,258	3.5	0.0
2	Airport Rd between Lilac St and Mitcher St	2,405	3.4	35	2,440	3.4	0.0
3	Airport Rd between Mitcher St and Euclid Ave	1,753	3.2	35	1,788	3.2	0.0
4	Airport Rd south of Euclid Ave	1,349	3.1	78	1,427	3.2	0.1
5	Ramona Ave between Littleness Ave and Lerwick Dr	985	3.0	9	994	3.0	0.0
6	Casanova Ave between Melway Cir and Shopping Center Dwy	5,250	3.7	35	5,285	3.7	0.0
7	Euclid Ave between Airport Rd and Casanova Ave	3,139	3.5	39	3,178	3.5	0.0

Notes:
1. ADT = Average Daily Traffic Volume.
2. ADTs on Segments 1 - 6 based on counts conducted in November 2016, May 2017 and June 2017.
3. Existing daily volume on Segment 7 estimated from PM peak hour counts on east leg of Airport Road / Euclid Avenue intersection.
4. TIRE: Traffic Infusion of Residential Environment.
5. Change in TIRE index shaded in red indicates that increase in traffic may be noticeable to residents.

4.1.8 Existing Plus Proposed Project Short-Term – N. Fremont / Highway 1 / Highway 68 Merge Areas

Although outside the study area based on Program j.2.1 of the City of Monterey General Plan, the short weaving segments at the N. Fremont Street / Highway 1 / Highway 68 interchange were analyzed as they relate to the increase in trips from the Proposed Project Short-Term based on comments received from Caltrans District 5 staff.

These short weaving segments and their approximate weave lengths are described below and are shown graphically in **Appendix O**.

- WB Highway 68 to SB Highway 1 merge with SB Highway 1 – 1,530 feet
- NB Highway 1 to EB N. Fremont Street merge with NB Highway 1 – 1,420 feet
- SB Highway 1 to EB Highway 68 merge with SB Highway 1 – 1,100 feet
- WB Highway 68 to NB Highway 1 merge with NB Highway 1 – 410 feet

The redistribution of trips generated by the relocated 44 hangars from the southeast General Aviation (GA) area to the northern GA area would not change the number of trips on weaving

segments #1 and #2 as trips to and from the south would continue to use these weaving segments. The redistribution of trips generated by the relocated 44 hangars would reduce the number of peak hour trips on weaving segments #3 and #4 as trips to and from the north would no longer use the N. Fremont Street / Highway 1 / Highway 68 interchange.

As shown in **Table 5**, the Project is estimated to generate at most two new peak hour trips, one inbound and one outbound. The one inbound and one outbound trip generated by 7 new hangars would add on average less than one peak hour trip to weaving segments #1 and #2, and are not expected to add any trips to weaving segments #3 and #4. Therefore, the Proposed Project Short-Term would not have an impact on these weaving segments.

4.1.9 Proposed Project Short-Term – Construction Impacts

Proposed Project Short-Term construction is expected to occur in five phases. A description of the construction activities associated with each phase is included in **Table 9**. The project civil engineers provided estimates of the total number of construction-related round trips for each phase of construction, which are shown in **Table 10**. The trip estimates include trips by construction workers, the delivery of materials and equipment, the hauling of surplus earthwork, and the removal of construction debris from the project site to an off-site location. The number of daily construction vehicle trips generated by the project will vary depending on the phase and the specific construction activities taking place on any given day. The construction-related round trips per phase were converted to average daily trips, which are shown in **Table 11**. The average number of truck trips per hour were also estimated.

As a conservative estimate, construction trips were assumed to occur 5 days a week (i.e., Monday through Friday). If work is also conducted on the weekend, then the average number of construction trips per day could be reduced. An average of 240 working days per year was estimated. This assumes 20 working days per month for 12 months of each year.

Total Trips

For the Proposed Project, Phase 4 is expected to generate the highest number of total daily trips (passenger vehicles and trucks) with an average of 46 daily trips. Assuming each truck is the equivalent of 2 passenger vehicles, construction of the Proposed Project would have the potential traffic impacts of about 74 passenger vehicle trips per day.

Passenger Vehicle Trips

Passenger vehicle trips are anticipated for the construction workers. For the Proposed Project, Phase 5 is expected to generate the highest number of daily trips by construction workers, with an average of 22 daily trips. This is a conservative estimate. Again, if work is conducted on weekends, the number of daily trips would be reduced.

Truck Trips

Truck trips are anticipated for earth removal, the delivery of materials and equipment, and construction debris removal. Truck trips were assumed to occur 5 days a week between the hours of 9:00 a.m. and 4:00 p.m., for a total of 7 hours per day. This is a conservative estimate. If work is also conducted on weekends or during a longer workday, the average number of trips would be reduced.

Earth removal is expected to occur in Phases 2 and 4. It is estimated that a total of 34,700 cubic yards of earth will be hauled off-site during Phases 2 and 4 (16,450 cubic yards during Phase 2 and 18,250 cubic yards during Phase 4). No off-site earth removal from the site is expected during Phases 1, 3, and 5. Construction debris removal is expected to occur in Phases 2 and 3.

Table 9: Proposed Project Construction Activities

Construction Phase	Construction Activity on North or South Side of Airport	Years per Phase	Description of Construction Activity
Phase 1 (2019-2021)	North	3	General Aviation (GA) Prep/Install hangars; temporary Airport Rescue & Firefighting (ARFF) building
Phase 2 (2022-2026)	South	5	Demo South GA & ARFF; grade and construct terminal, apron, roads, rental car lot; construct terminal parking garage. Repair haul road.
Phase 3 (2027)	South	1	Demolish old terminal; construct new ARFF
Phase 4 (2028)	South	1	Restripe TW A & move hold lines; Construct surface lot/garage along Fred Kane Dr.
Phase 5 (2029)	North	1	Construct "north side" road
Phase 5 (2029)	South		Construct Highway 68 frontage loop road
Total		**11**	

Table 10: Proposed Project Construction Trips – Round Trips Per Phase

Construction Phase	Construction Activity on North or South Side of Airport	Years per Phase	Construction Workers	Deliveries of Materials & Equipment	On-Airport[4] Earth Removal	Off-Airport Earth Removal	Construction Debris Removal	Total[4] Round Trips
Phase 1 (2019-2021)	North	3	2,458	3,278	2,428	0	0	5,736
Phase 2 (2022-2026)	South	5	10,374	4,812	7,524	1,316	629	17,131
Phase 3 (2027)	South	1	1,043	87	0	0	120	1,250
Phase 4 (2028)	South	1	2,165	1,824	0	1,460	0	5,449
Phase 5 (2029)	North	1	2,601	788	0	0	0	3,389
Phase 5 (2029)	South		792	1,031	0	0	0	1,823
Total		**11**	**19,433**	**11,820**	**9,952**	**2,776**	**749**	**34,778**

Notes:
1. Assumes 25 cubic yards (cy) of earth removal per haul trip. Each truckload has a return trip with an empty truck. This equates to a total of 34,700 cubic yards of earth removal: 2,776 earth removal round trips / 2 = 1,388 outbound hauls. 1,388 hauls x 25 cy/haul = 34,700 cy
2. Construction workers assumed to arrive/depart site in passenger vehicles (cars & pickup trucks).
3. Assumes earth removal, construction debris removal, and deliveries of materials and equipment are all made by trucks.
4. "On-Airport" earth removal trips are assumed to have both trip ends on-site and are therefore excluded from construction vehicle trip totals.
5. Phase duration assumed to include 12 calendar months for each year of each phase.
6. One round trip = two total trips (i.e., one inbound, one outbound).

Table 11: Proposed Project Construction Trips – Average Trips per Day / Hour

Construction Phase	Construction Activity on North or South Side of Airport	Years per Phase	Passenger Vehicle Trips per Day	Truck Trips per Day	Total Trips per Day	Total Trips per Day in PCE	Truck Trips per Hour	Truck Trips per Hour in PCE
Phase 1 (2019-2021)	North	3	6	10	16	26	1	2
Phase 2 (2022-2026)	South	5	16	12	28	40	2	4
Phase 3 (2027)	South	1	8	2	10	12	1	2
Phase 4 (2028)	South	1	18	28	46	74	4	8
Phase 5 (2029)	North	1	22	6	28	34	1	2
Phase 5 (2029)	South		8	8	16	24	1	2
Total		**11**						

Notes:
1. Assumes 240 working days per year (20 working days per month x 12 months per year).
2. Truck trips assume a conservative 7-hour workday, outside of peak hours (e.g, 9:00 a.m to 4:00 p.m.)
3. Passenger Car Equivalents (PCE): 1 truck = 2 passenger vehicles (per HCM 2010 Exhibit 21-10).
4. The highest number of trips generated by each phase are shaded in red.
5. Average trips represent total trips (i.e, inbound and outbound).

No construction debris removal is expected during Phases 1, 4, and 5. Delivery of materials and equipment is expected to occur during all construction phases.

Daily truck trips associated with earth removal, deliveries of materials and equipment, and the removal of construction debris were combined and estimated for each construction phase. Phase 4 is expected to generate the highest number of daily truck trips, with an average of 28 daily truck trips. Assuming each truck is the equivalent of 2 passenger vehicles, construction of the Proposed Project would have the potential traffic impacts of about 74 passenger vehicle trips per day.

Truck trips were also combined and estimated on an hourly basis for each construction phase. The highest number of hourly truck trips is estimated to occur during Phase 4, with an average of 4 truck trips per hour. Assuming each truck is the equivalent of 2 passenger vehicles, the Proposed Project would have the potential traffic impacts of about 8 passenger vehicle trips per hour.

Analysis

A map showing the proposed construction vehicle haul routes is included in **Figure 18**. A comparison of the amount of construction vehicle trips in relation to the existing traffic volumes on the roads near the project site is provided in **Table 12**. The total daily construction vehicle trips, including passenger vehicles and trucks, were converted to passenger car equivalents (PCE) and assigned to the available haul routes. The haul routes and construction phases where construction-related trips would represent more than 1% of existing daily traffic are highlighted in **Table 12**.

Proposed Project haul routes for construction activities on the south side of the Airport include Olmsted Road and Highway 68. Construction activities for the Proposed Project on the south side of the Airport would represent about 1.3% (Phase 4) of the existing traffic on Olmsted Road and 0.4% (Phase 4) of the existing traffic on Highway 68.

Proposed Project construction haul routes for construction activities on the north side of the Airport include Airport Road and N. Fremont Street. Construction activities for the Proposed Project on the north side of the Airport would represent about 1.4% (Phase 5) of the existing traffic on Airport Road and 0.2% (Phase 5) of the existing traffic on N. Fremont Street.

Impacts and Recommendations

Construction vehicle trips associated with the Proposed Project would represent a small fraction (1.4% or less) of the existing daily volumes on the study road network. However, construction-related trips will be added to intersections and road segments that have been identified as operating deficiently during the peak commute hours under existing conditions, as described in Sections 2.3 and 2.4. As a result, project construction traffic impacts would be significant and unavoidable. Construction-related impacts would be temporary. To reduce construction impacts, truck hauling operations should not occur during the hours of 7:00 to 9:00 a.m. and 4:00 to 6:00 p.m., Monday through Friday.

Figure 18: Proposed Project Construction Vehicle Haul Routes

Table 12: Proposed Project Construction Trips as a Percentage of Existing ADT

Construction Phase	Total Daily Construction Trips (PCE)	Construction Activity Area	Proposed Project Haul Routes	Existing ADT	Construction Trips % of ADT
1	26	North	Airport Rd	2,400	1.1%
1	26	North	Fremont St	19,000	0.1%
2	40	South	Olmsted Rd	5,800	0.7%
2	40	South	Highway 68	18,800	0.2%
3	12	South	Olmsted Rd	5,800	0.2%
3	12	South	Highway 68	18,800	0.1%
4	74	South	Olmsted Rd	5,800	1.3%
4	74	South	Highway 68	18,800	0.4%
5	34	North	Airport Rd	2,400	1.4%
5	34	North	Fremont St	19,000	0.2%
5	24	South	Olmsted Rd	5,800	0.4%
5	24	South	Highway 68	18,800	0.1%

Notes:
1. Total Daily Construction Trips (PCE) includes trips by construction workers and truck trips, with truck trips converted to Passenger Car Equivalents (PCE).
2. Construction Activity Area refers to construction activities on the north and south sides of the Airport.
3. Haul routes include roads closest to the project site that would be most affected by construction vehicle trips. Construction vehicles trips would disperse onto other roads as they move farther from the project site, reducing the potential for construction traffic impacts.
4. The haul routes and construction phases where construction-related trips would represent more than 1% of existing daily traffic are shaded in red.
5. ADT = Average Daily Traffic Volume

4.2 Alternative 1 Project Short-Term Traffic Conditions

4.2.1 Alt. 1 Project Short-Term – Trip Generation, Distribution, and Assignment

The ITE *Trip Generation* manual does not contain appropriate trip generation rates for the Port-a-Port T-hangars, the Monterey Navy Flying Club, the Airport Rescue and Firefighting (ARFF) building, or the General Aviation hangars. The trip generation rates for these land uses were therefore developed based on actual gate counts at the Airport's existing hangar gates on the southeast ramp, and the staffing schedule and incident reports for the ARFF building. The gate counts and ARFF data were both collected between November 1 and December 31, 2016. The gate counts represent typical activity levels at the Airport and are therefore appropriate for use in developing the trip generation rates.

As discussed in Section 3.2.2, the Alternative 1 Project Short-Term scenario includes a combination of actions and development that would reduce traffic at some locations and increase traffic at other locations within the study area. This scenario would result in a total net new trip generation of 10 daily trips, with 1 occurring during the AM peak hour (1 in, 0 out) and 2 occurring during the PM peak hour (1 in, 1 out). Details of the Alternative 1 Project Short-Term trip generation are provided in **Table 13**.

The Project trips were assigned to the study intersections using the same distribution percentages used for the Proposed Project Short-Term scenario. The increases and reductions in trips from the relocated hangars and ARFF building were added to the new trips generated by the new hangars to obtain the Alternative 1 Project Short-Term AM and PM peak hour trip assignments, which are shown in **Figures 19** and **20**.

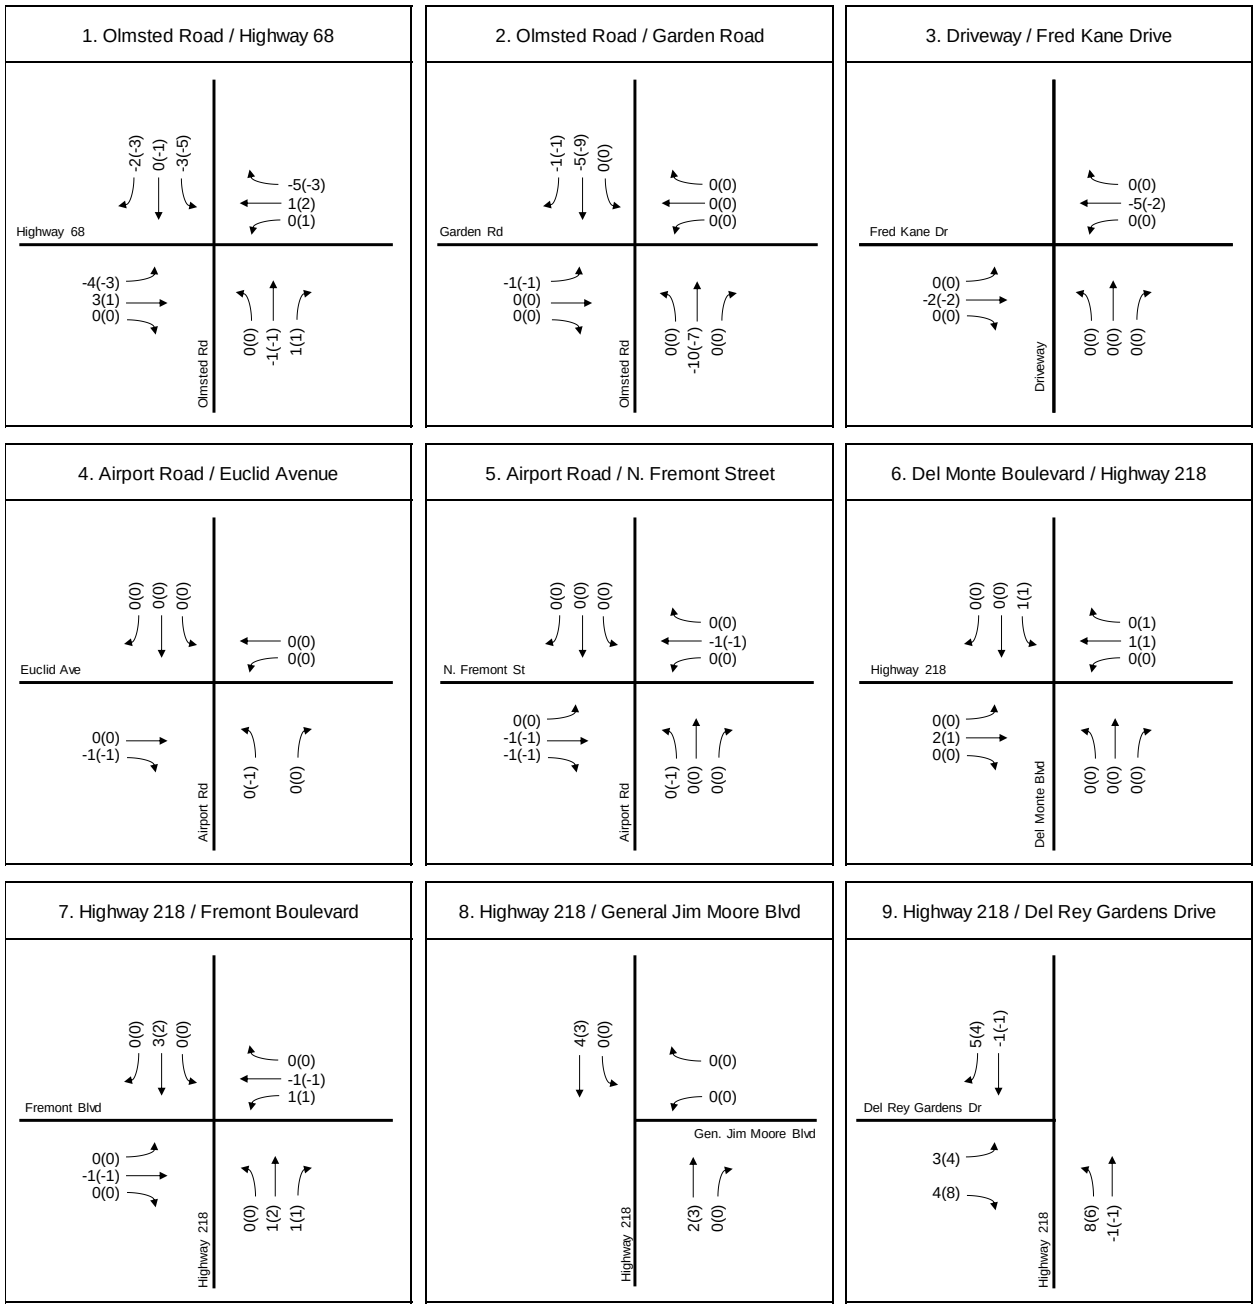
Table 13: Alternative 1 Project Short-Term Trip Generation

Alternative 1 Project Short-Term		WEEK DAY	WEEKDAY AM PK HR			WEEKDAY PM PK HR		
TRIP GENERATION RATES	ITE Code	DAILY RATE	PK HR RATE	% IN	% OUT	PK HR RATE	% IN	% OUT
Hangars (per unit)	N/A	1.41	0.17	83%	17%	0.32	45%	55%
TRIPS GENERATED BY AREA	Units / SF	DAILY TRIPS	PK HR TRIPS	TRIPS IN	TRIPS OUT	PK HR TRIPS	TRIPS IN	TRIPS OUT
North Side via CONA Neighborhood								
Relocated Port-a-Port & Navy Flying Club Hangars	-7	-10	-1	-1	0	-2	-1	-1
North Side via North Side Road								
Relocated GA Hangars	44	62	7	6	1	14	6	8
New GA Hangars	7	10	1	1	0	2	1	1
Relocated Port-a-Port & Navy Flying Club Hangars	7	10	1	1	0	2	1	1
Relocated ARFF Building	1	20	10	5	5	4	2	2
South Side via Olmsted Road								
Relocated GA Hangars	-44	-62	-7	-6	-1	-14	-6	-8
Relocated ARFF Building	-1	-20	-10	-5	-5	-4	-2	-2
Total Net New Generated Trips		**10**	**1**	**1**	**0**	**2**	**1**	**1**

Notes:

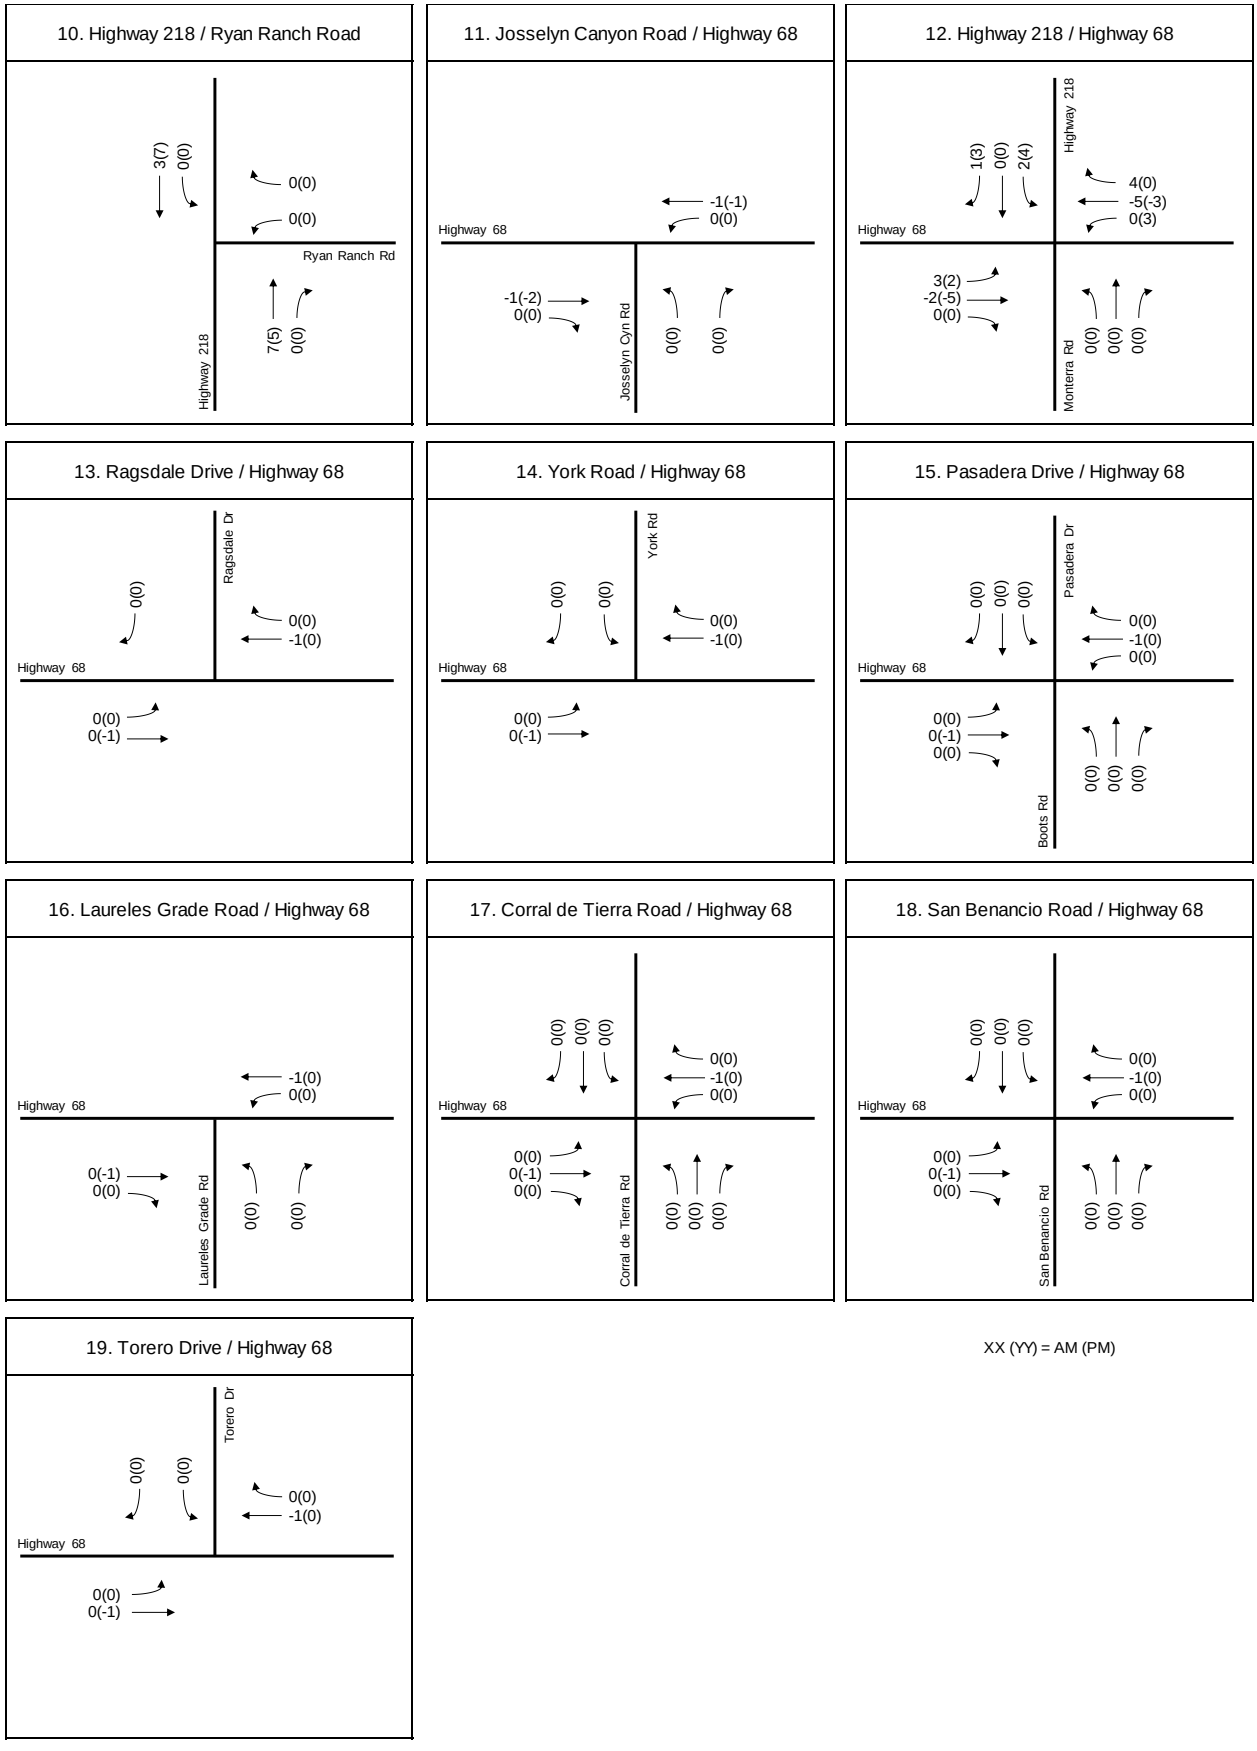
1. Trip generation rates for hangars based on gate counts at Monterey Regional Airport (November 1 - December 31, 2016).
2. Relocated trips in red are subtracted from their current access point and added to the north side via the North Side Road.
3. Trips generated by ARFF building based on Monterey Fire Department staffing, schedule, and incident reports (November 1 - December 31, 2016).

Figure 19: Alt. 1 Project Short-Term Trip Assignment (1 – 9)



XX (YY) = AM (PM)

Figure 20: Alt. 1 Project Short-Term Trip Assignment (10 – 19)



4.2.2 Existing Plus Alt. 1 Project Short-Term – Intersection Operations

The Alternative 1 Project Short-Term trip assignments were combined with the Existing conditions traffic volumes to obtain Existing Plus Alternative 1 Project Short-Term AM and PM peak hour traffic volumes, which are shown in **Figures 21** and **22**.

Based on the City of Monterey and Caltrans level of service standards, the following study intersections would operate deficiently under Existing Plus Alternative 1 Project Short-Term traffic conditions:

Intersection #1 – Olmsted Road / Highway 68

Intersection #6 – Del Monte Boulevard / Highway 218

Intersection #7 – Highway 218 / Fremont Boulevard

Intersection #11 – Josselyn Canyon Road / Highway 68

Intersection #14 – York Road / Highway 68

Intersection #15 – Pasadera Drive / Highway 68

Intersection #17 – Corral De Tierra Road / Highway 68

Intersection #18 – San Benancio Road / Highway 68

Intersection #19 – Torero Drive / Highway 68

It should be noted that these intersections would also operate at deficient levels of service without the Project.

4.2.3 Existing Plus Alt. 1 Project Short-Term – Road Segment Operations

As discussed in Section 2.4, the following road segments would operate deficiently under Existing traffic conditions. These segments would continue to operate deficiently under Existing Plus Proposed Project Short-Term conditions.

Segment #2 – Highway 68, from Begin/End Freeway to Josselyn Canyon Road

Segment #3 – Highway 68, from Josselyn Canyon Road to Olmsted Road

Segment #4 – Highway 68, from Olmsted Road to Highway 218

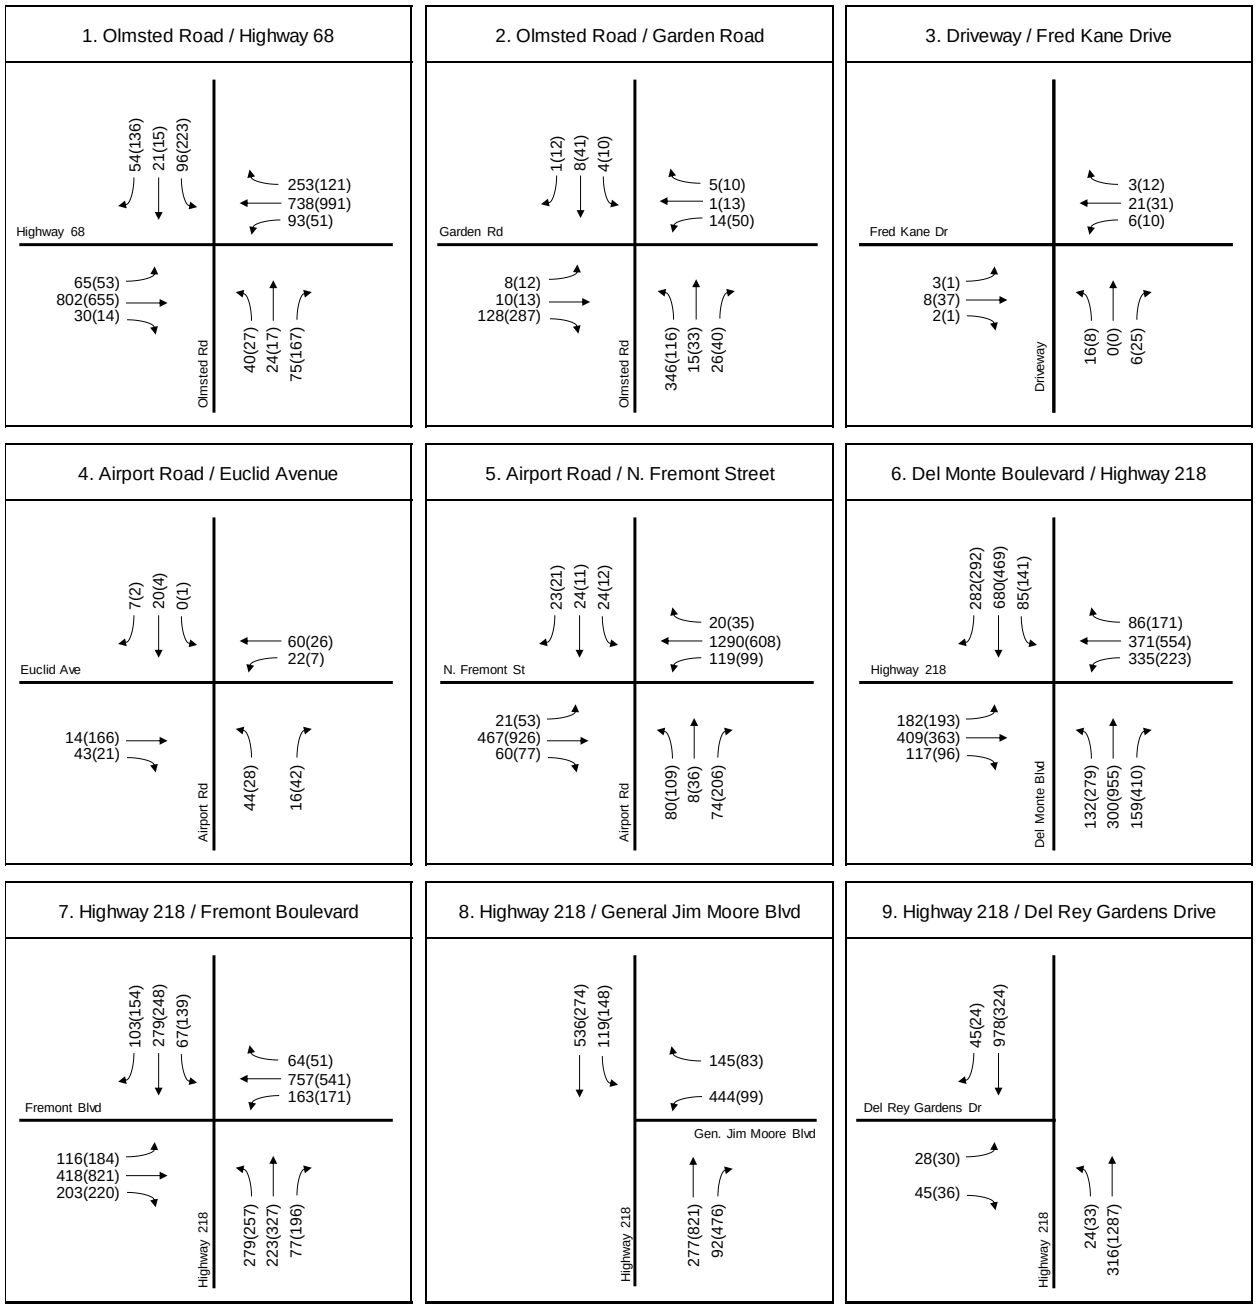
Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade

Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road

Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive

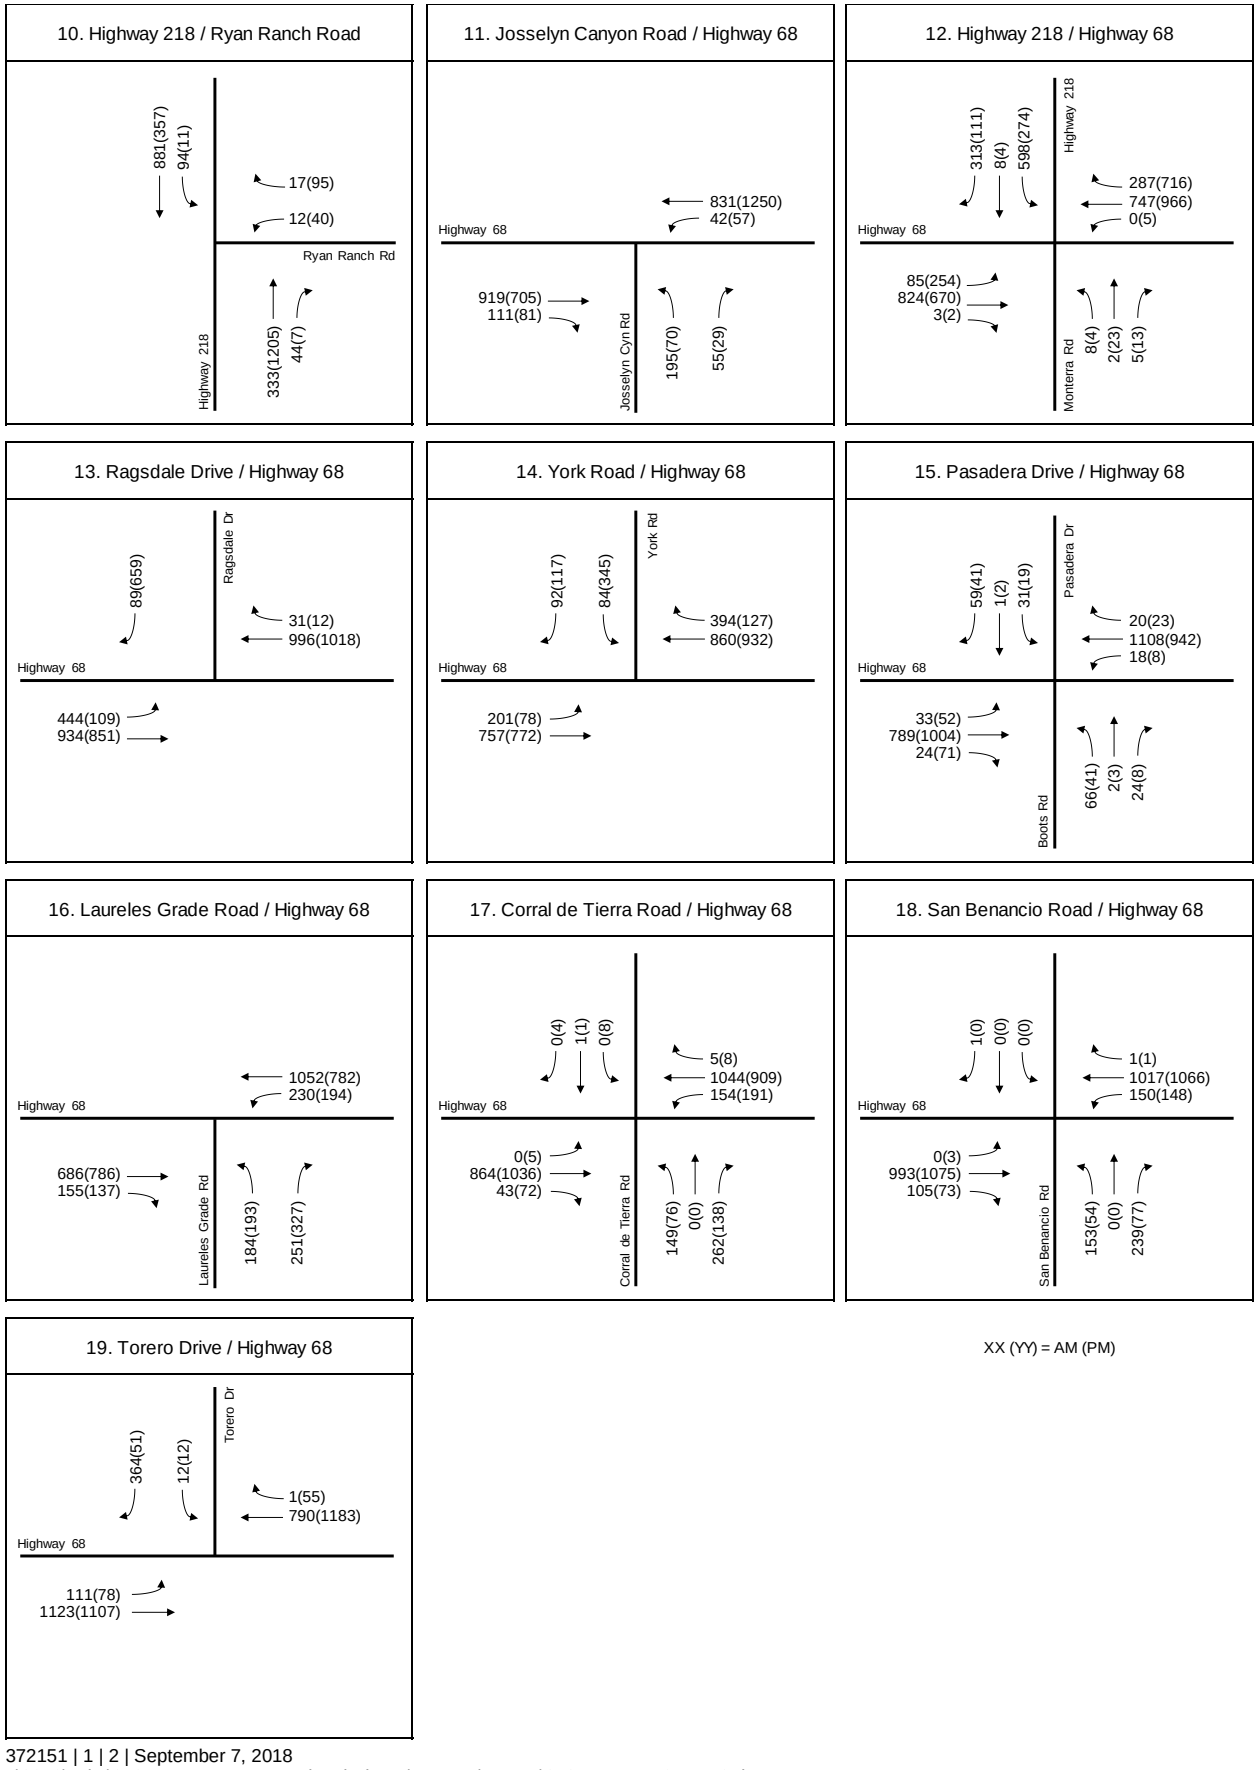
Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

Figure 21: Existing Plus Alt. 1 Project Short-Term Volumes (1 – 9)



XX (YY) = AM (PM)

Figure 22: Existing Plus Alt. 1 Project Short-Term Volumes (10 – 19)



4.2.4 Existing Plus Alt. 1 Project Short-Term – Project Impacts

Based on the criteria for project impacts, the Alternative 1 Project would have a significant impact at the following intersections under Existing Plus Alternative 1 Project Short-Term conditions (**Tables 14** and **15**):

Intersection #6 – Del Monte Boulevard / Highway 218

Intersection #7 – Highway 218 / Fremont Boulevard

Based on the Caltrans impact criteria, the addition of a single project trip at an intersection that is operating deficiently can be considered an impact. Although intersections #1, #11, #14, #15, #17, #18, and #19 (all Caltrans intersections) would operate deficiently under Existing Plus Alternative 1 Project Short-Term conditions (and under Existing conditions), the Alternative 1 Project would not impact these intersections either because a) the redistribution of traffic that would occur with the relocation of the existing hangars would result in an overall reduction of traffic at the intersection or b) the Project is not expected to add traffic to the intersection during the peak hour that is operating deficiently. Under these circumstances, the Project would not trigger a significant impact under any of the applicable thresholds.

Based on the criteria for project impacts, the Project would have a significant impact on the following road segments under Existing Plus Alternative 1 Project Short-Term conditions:

Segment #4 – Highway 68, from Olmsted Road to Highway 218

4.2.5 Existing Plus Alt. 1 Project Short-Term – Mitigation Measures

The improvements listed below are recommended to mitigate the Project's impacts under Existing Plus Proposed Alternative 1 Project Short-Term conditions. As discussed at Draft EIR sections 4.16. and 5.5.16, and at Draft EIR Appendix N, the improvements, however, may not be feasible if disallowed by federal law; federal law states that airport revenues and Federal Aviation Administration (FAA) grant funds may not be used for purposes other than the capital or operating costs of the airport, the local airport system, or other local facilities owned or operated by the airport owner or operator that are directly and substantially related to the air transportation of passengers and property. These restrictions impact the Airport's ability to fund and implement off-airport mitigation measures. Now that the Airport has identified specific mitigation measures for Proposed Project cumulative impacts, it can make specific requests to the FAA, where appropriate, for it to allow funding of off-airport mitigation measures.

At this time, however, because the Airport does not currently have a determination from the FAA that funding for any off-airport mitigation improvements will be allowed, the following mitigation measures are considered infeasible:

Intersection #6: Del Monte Boulevard / Highway 218 – Mitigation #1

1. Add 2nd Northbound Del Monte Boulevard Left-Turn Lane

Implementation of this improvement would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of this improvement, based on the relative number of project trips it would add to the intersection (4 AM and 4 PM peak hour trips).

However, this improvement would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement this improvement. In addition, even with the Project's fair-share contribution, there is no guarantee

that there would be sufficient funding available to implement this improvement. This impact could be mitigated by constructing the left turn lane; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #7: Highway 218 / Fremont Boulevard – Mitigation #2

1. Add 2nd Northbound Highway 218 Left-Turn Lane

Implementation of this improvement would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of this improvement, based on the relative number of project trips it would add to the intersection (4 AM and 4 PM peak hour trips).

However, this improvement would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement this improvement. In addition, even with the Project's fair-share contribution, there is no guarantee that there would be sufficient funding available to implement this improvement. This impact could be mitigated by constructing the left turn lane; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Existing Plus Alternative 1 Project Short-Term intersection levels of service (LOS) with mitigation are also summarized in **Tables 14**and **15**. Levels of service with the proposed roundabouts are identified by PI#1, PI#2, etc. (for Proposed Improvement #). The levels of service with the proposed roundabouts do not necessarily indicate the project has an impact at that location. Mitigated levels of service indicate locations where the project would have an impact, and are identified by M#1, M#2, etc. (for Mitigation #).

LOS calculation worksheets for signalized, stop-controlled, and roundabout-controlled intersections are included in **Appendix H**. Vehicle queue estimates are included as **Appendix I**.

Road Segment #4

The Alternative 1 Project Short-Term is expected to add only 3 AM peak hour 4 PM peak hour trips to segment #4. This will not be enough of an increase in traffic to affect traffic operations on these segments.

Table 14: Existing Plus Alt. 1 Project Short-Term – Intersection LOS (1 – 9)

Scenario # →								1		3

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).
2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).
3 LOS highlighted in red indicates intersection operating below level of service standard.
4 * = delay greater than 300 seconds.
5 LOS in bold box indicates project impact.

4.2.6 Existing Plus Alt. 1 Project Short-Term – Bicycle, Pedestrian, and Transit Operations

The Airport supports bicycle use by Airport employees and the public by providing convenient, secure bicycle facilities on Airport premises. Two bike storage containers are currently available for public use at the terminal's east second level entrance.

As discussed in Section 3.3, the Project site plan includes pedestrian walkways adjacent to curbside bus, taxi, and drop-off/pick-up areas, as well as between the new terminal building and the rental car ready/return lot. A sidewalk around the perimeter of the terminal surface parking lot will enhance pedestrian safety between the surface parking lot and terminal building. These features are also included in the Proposed Project.

The Project site plan also includes a designated transit bus stop just west of the terminal building that is approximately 65 feet long.

The Alternative 1 Project Short-Term is not expected to generate a significant amount of bicycle, pedestrian, or transit trips and will not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities. Since the Alternative 1 Project will not decrease the performance or safety of such facilities, it will not impact the bicycle, pedestrian, or transit facilities in the study area.

4.2.7 Existing Plus Alt. 1 Project Short-Term – CONA Neighborhood Conditions

As described in Section 3.2.2, the Alternative 1 Project Short-Term includes the relocation of 44 hangars and the ARFF building from the south side of the Airport to the north side of the Airport and the addition of up to 7 new hangars to the north side of the Airport, as well as construction of the North Side Road.

With the construction of the North Side Road, access to the relocated and new hangars would be via Highway 218 and Del Rey Gardens Drive instead of Airport Road through the Casanova Oak Knoll (CONA) neighborhood. In addition, existing traffic generated by six Port-a-Port T-hangars and the Monterey Navy Flying Club hangar that currently use Airport Road through the CONA neighborhood would be re-routed to the north side of the Airport via Highway 218 and Del Rey Gardens Drive.

Therefore, the Alternative 1 Project Short-Term alternative would benefit the CONA neighborhood by not adding any new traffic to Airport Road through the CONA neighborhood and by reducing the current volume of traffic in the neighborhood.

4.2.8 Existing Plus Alt. 1 Project Short-Term – N. Fremont / Highway 1 / Highway 68 Merge Areas

Although outside the study area based on Program j.2.1 of the City of Monterey General Plan, the short weaving segments at the N. Fremont Street / Highway 1 / Highway 68 interchange were analyzed as they relate to the increase in trips from the Alternative 1 Project Short-Term based on comments received from Caltrans District 5 staff.

These short weaving segments and their approximate weave lengths are described below and are shown graphically in **Appendix O**.

- WB Highway 68 to SB Highway 1 merge with SB Highway 1 – 1,530 feet
- NB Highway 1 to EB N. Fremont Street merge with NB Highway 1 – 1,420 feet
- SB Highway 1 to EB Highway 68 merge with SB Highway 1 – 1,100 feet

- WB Highway 68 to NB Highway 1 merge with NB Highway 1 – 410 feet

The redistribution of trips generated by the relocated 44 hangars from the southeast General Aviation (GA) area to the northern GA area would not change the number of trips on weaving segments #1 and #2 as trips to and from the south would continue to use these weaving segments. The redistribution of trips generated by the relocated 44 hangars would reduce the number of peak hour trips on weaving segments #3 and #4 as trips to and from the north would no longer use the N. Fremont Street / Highway 1 / Highway 68 interchange.

As shown in **Table 13**, the Alternative 1 Project Short-Term is estimated to generate at most two new peak hour trips, one inbound and one outbound. The one inbound and one outbound trip generated by 7 new hangars would add on average less than one peak hour trip to weaving segments #1 and #2, and are not expected to add any trips to weaving segments #3 and #4. Therefore, the Alternative 1 Project Short-Term would not have an impact on these weaving segments.

4.2.9 Alternative 1 Project Short-Term – Construction Impacts

Alternative 1 Project Short-Term construction is expected to occur in five phases. A description of the construction activities associated with each phase is included in **Table 16**. The project civil engineers provided estimates of the total number of construction-related round trips for each phase of construction, which are shown in **Table 17**. The trip estimates include trips by construction workers, the delivery of materials and equipment, the hauling of surplus earthwork, and the removal of construction debris from the project site to an off-site location. The number of daily construction vehicle trips generated by the project will vary depending on the phase and the specific construction activities taking place on any given day. The construction-related round trips per phase were converted to average daily trips, which are shown in **Table 18**. The average number of truck trips per hour were also estimated.

As a conservative estimate, construction trips were assumed to occur 5 days a week (i.e., Monday through Friday). If work is also conducted on the weekend, then the average number of construction trips per day could be reduced. An average of 240 working days per year was estimated. This assumes 20 working days per month for 12 months of each year.

Total Trips

For the Alternative 1 Project, Phase 2 is expected to generate the highest number of total daily trips (passenger vehicles and trucks) with an average of 36 daily trips. Assuming each truck is the equivalent of 2 passenger vehicles, construction of the Alternative 1 Project would have the potential traffic impacts of about 58 passenger vehicle trips per day, which would occur during Phase 4.

Passenger Vehicle Trips

Passenger vehicle trips are anticipated for the construction workers. For the Alternative 1 Project, Phase 2 is expected to generate the highest number of daily trips by construction workers, with an average of 22 daily trips. This is a conservative estimate. Again, if work is conducted on weekends, the number of daily trips would be reduced.

Truck Trips

Truck trips are anticipated for earth removal, the delivery of materials and equipment, and construction debris removal. Truck trips were assumed to occur 5 days a week between the hours of 9:00 a.m. and 4:00 p.m., for a total of 7 hours per day. This is a conservative estimate.

Table 16: Alternative 1 Project Construction Activities

Construction Phase	Construction Activity on North or South Side of Airport	Years per Phase	Description of Construction Activity
Phase 1 (2019-2021)	North	3	General Aviation (GA) Prep/Install hangars; Construct new Airport Rescue & Firefighting (ARFF) building; Construct "north side" road
Phase 2 (2022-2025)	South	4	Demo South GA & ARFF; grade and construct terminal, apron, roads, rental car & terminal surface lots. Repair haul road.
Phase 3 (2026)	South	1	Restripe TW A & move hold lines; Demolish old terminal
Phase 4 (2027)	South	1	Construct surface parking along Fred Kane Dr.
Phase 5 (2028)	South	1	Construct Highway 68 frontage cul-de-sac
Total		**10**	

Table 17: Alternative 1 Project Construction Trips – Round Trips per Phase

Construction Phase	Construction Activity on North or South Side of Airport	Years per Phase	Construction Workers	Deliveries of Materials & Equipment	On-Airport[4] Earth Removal	Off-Airport Earth Removal	Construction Debris Removal	Total[4] Round Trips
Phase 1 (2019-2021)	North	3	5,439	4,066	2,428	0	0	9,505
Phase 2 (2022-2025)	South	4	9,934	4,969	7,524	1,316	629	16,848
Phase 3 (2026)	South	1	663	87	0	0	120	870
Phase 4 (2027)	South	1	1,167	1,501	0	1,460	0	4,128
Phase 5 (2028)	South	1	694	288	0	0	0	982
Total		**10**	**17,897**	**10,911**	**9,952**	**2,776**	**749**	**32,333**

Notes:
1. Assumes 25 cubic yards (cy) of earth removal per haul trip. Each truckload has a return trip with an empty truck. This equates to a total of 34,700 cubic yards of earth removal: 2,776 earth removal round trips / 2 = 1,388 outbound hauls. 1,388 hauls x 25 cy/haul = 34,700 cy
2. Construction workers assumed to arrive/depart site in passenger vehicles (cars & pickup trucks).
3. Assumes earth removal, construction debris removal, and deliveries of materials and equipment are all made by trucks.
4. "On-Airport" earth removal trips are assumed to have both trip ends on-site and are therefore excluded from construction vehicle trip totals.
5. Phase duration assumed to include 12 calendar months for each year of each phase.
6. One round trip = two total trips (i.e., one inbound, one outbound).

Table 18: Alternative 1 Project Construction Trips – Average Trips per Day / Hour

Construction Phase	Construction Activity on North or South Side of Airport	Years per Phase	Passenger Vehicle Trips per Day	Truck Trips per Day	Total Trips per Day	Total Trips per Day in PCE	Truck Trips per Hour	Truck Trips per Hour in PCE
Phase 1 (2019-2021)	North	3	14	12	26	38	2	4
Phase 2 (2022-2025)	South	4	22	14	36	50	2	4
Phase 3 (2026)	South	1	6	2	8	10	1	2
Phase 4 (2027)	South	1	10	24	34	58	3	6
Phase 5 (2028)	South	1	6	2	8	10	1	2
Total		**10**						

Notes:
1. Assumes 240 working days per year (20 working days per month x 12 months per year).
2. Truck trips assume a conservative 7-hour workday, outside of peak hours (e.g, 9:00 a.m to 4:00 p.m.)
3. Passenger Car Equivalents (PCE): 1 truck = 2 passenger vehicles (per HCM 2010 Exhibit 21-10).
4. The highest number of trips generated by each phase are shaded in red.
5. Average trips represent total trips (i.e, inbound and outbound).

If work is also conducted on weekends or during a longer workday, the average number of trips would be reduced.

Earth removal is expected to occur in Phases 2 and 4. It is estimated that a total of 34,700 cubic yards of earth will be hauled off-site during Phases 2 and 4 (16,450 cubic yards during Phase 2 and 18,250 cubic yards during Phase 4). No off-site earth removal from the site is expected

during Phases 1, 3, and 5. Construction debris removal is expected to occur in Phases 2 and 3. No construction debris removal is expected during Phases 1, 4, and 5. Delivery of materials and equipment is expected to occur during all construction phases.

Daily truck trips associated with earth removal, deliveries of materials and equipment, and the removal of construction debris were combined and estimated for each construction phase. Phase 4 is expected to generate the highest number of daily truck trips, with an average of 24 daily truck trips. Assuming each truck is the equivalent of 2 passenger vehicles, construction of the Alternative 1 Project would have the potential traffic impacts of about 58 passenger vehicle trips per day.

Truck trips were also combined and estimated on an hourly basis for each construction phase. The highest number of hourly truck trips is estimated to occur during Phase 4, with an average of 3 truck trips per hour. Assuming each truck is the equivalent of 2 passenger vehicles, the Alternative 1 Project would have the potential traffic impacts of about 6 passenger vehicle trips per hour.

Analysis

A map showing the proposed construction vehicle haul routes is included in **Figure 23**. A comparison of the amount of construction vehicle trips in relation to the existing traffic volumes on the roads near the project site is provided in **Table 19**. The total daily construction vehicle trips, including passenger vehicles and trucks, were converted to passenger car equivalents (PCE) and assigned to the available haul routes. The haul routes and construction phases where construction-related trips would represent more than 1% of existing daily traffic are highlighted in **Table 19**.

Alternative 1 Project haul routes for construction activities on the south side of the Airport include Olmsted Road and Highway 68. Construction activities for the Alternative 1 Project on the south side of the Airport would represent about 1% (Phase 4) of the existing traffic on Olmsted Road and 0.3% (Phases 2 and 4) of the existing traffic on Highway 68.

Alternative 1 Project construction haul routes for construction activities on the north side of the Airport include Del Rey Gardens Drive and Highway 218. Construction activities for the Alternative 1 Project on the north side of the Airport would represent about 3.8% (Phase 1) of the existing traffic on Del Rey Gardens Drive and 0.3% (Phase 1) of the existing traffic on Highway 218.

Impacts and Recommendations

Construction vehicle trips associated with the Alternative 1 Project would represent a small fraction (3.8% or less) of the existing daily volumes on the study road network. However, construction-related trips will be added to intersections and road segments that have been identified as operating deficiently during the peak commute hours under existing conditions, as described in Sections 2.3 and 2.4. As a result, project construction traffic impacts would be significant and unavoidable. Construction-related impacts would be temporary. To reduce construction impacts, truck hauling operations should not occur during the hours of 7:00 to 9:00 a.m. and 4:00 to 6:00 p.m., Monday through Friday.

Figure 23: Alternative 1 Project Construction Vehicle Haul Routes

Table 19: Alternative 1 Project Construction Trips as a Percentage of ADT

Construction Phase	Total Daily Construction Trips (PCE)	Construction Activity Area	Alternative 1 Project Haul Routes	Existing ADT	Construction Trips % of ADT
1	38	North	Del Rey Gardens Dr	1,000	3.8%
1	38	North	Highway 218	13,200	0.3%
2	50	South	Olmsted Rd	5,800	0.9%
2	50	South	Highway 68	18,800	0.3%
3	10	South	Olmsted Rd	5,800	0.2%
3	10	South	Highway 68	18,800	0.1%
4	58	South	Olmsted Rd	5,800	1.0%
4	58	South	Highway 68	18,800	0.3%
5	10	South	Olmsted Rd	5,800	0.2%
5	10	South	Highway 68	18,800	0.1%

Notes:
1. Total Daily Construction Trips (PCE) includes trips by construction workers and truck trips, with truck trips converted to Passenger Car Equivalents (PCE).
2. Construction Activity Area refers to construction activities on the north and south sides of the Airport.
3. Haul routes include roads closest to the project site that would be most affected by construction vehicle trips. Construction vehicles trips would disperse onto other roads as they move farther from the project site, reducing the potential for construction traffic impacts.
4. The haul routes and construction phases where construction-related trips would represent more than 1% of existing daily traffic are shaded in red.
5. ADT = Average Daily Traffic Volume

5 Background Traffic Conditions

This section describes traffic operations in the study area under Background conditions, within a timeframe of approximately 10 years. This scenario does not include trips generated by the Project, but does include trips generated by increased enplanements at the Airport unrelated to the proposed Project, as well as other development projects in the study area.

5.1 Background Traffic Volumes

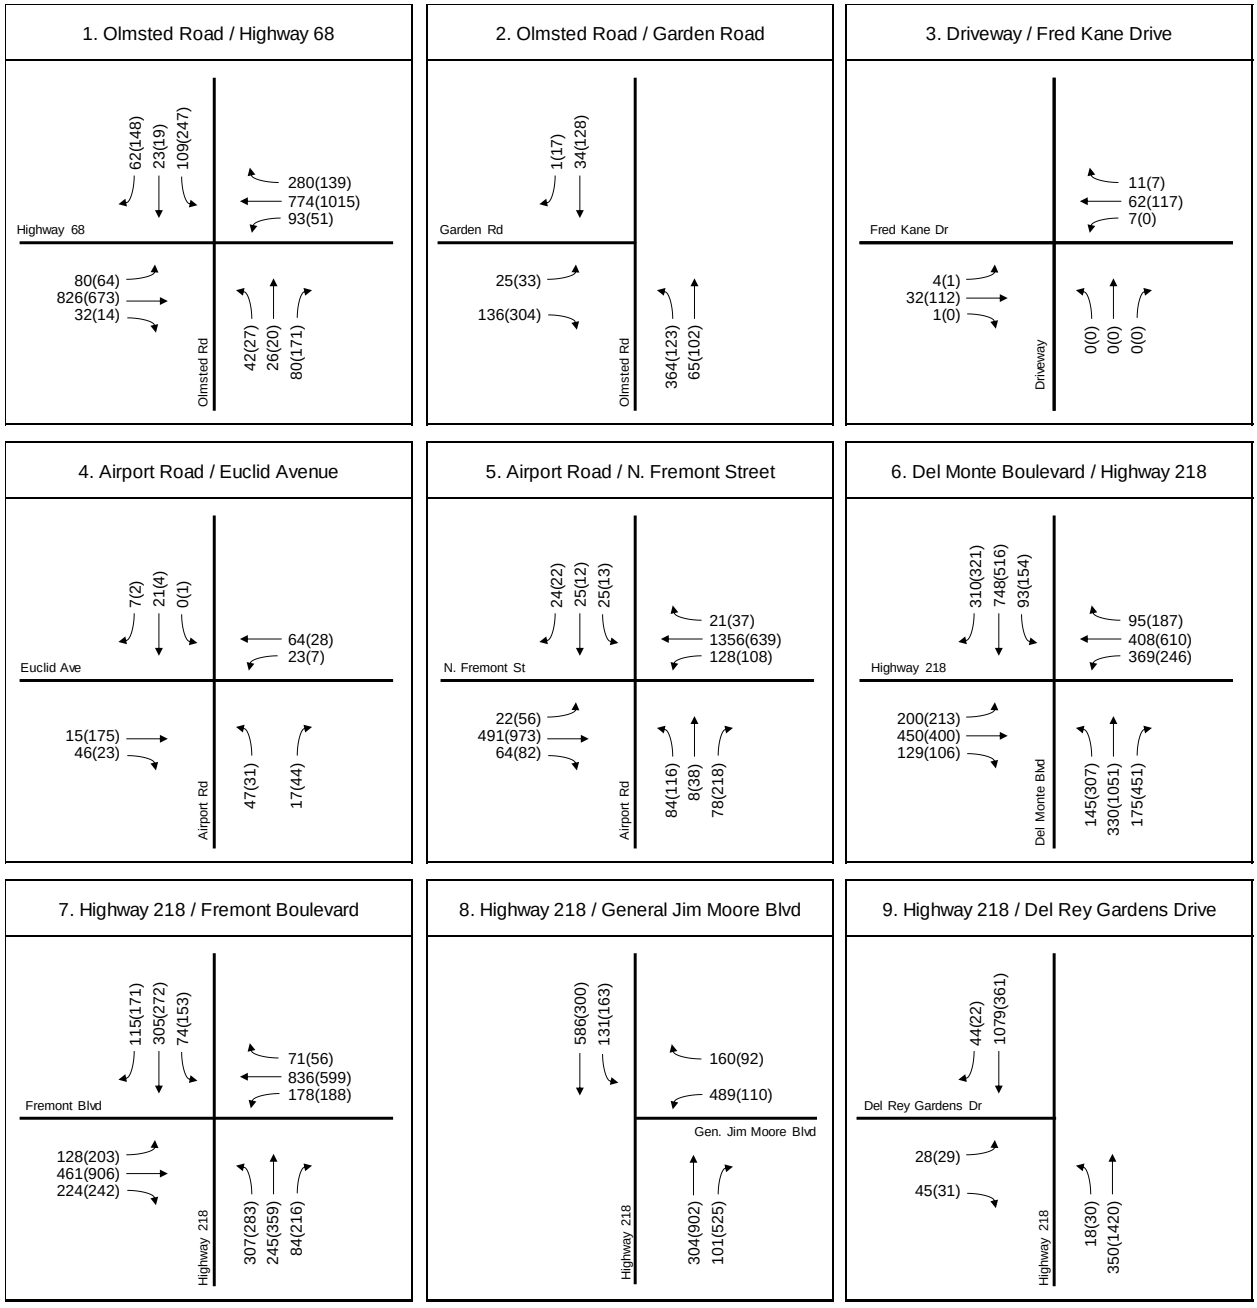
Anticipated growth in the boarding of passengers (i.e., enplanements) is expected to occur with or without the implementation of the Project. As discussed in Chapter 2 of the Proposed Airport Master Plan (AMP), which is attached to the Draft EIR as Appendix B, the aviation activity forecast for the Airport was prepared based on projections of regional and national economic performance, and on overall aviation trends. Further, the forecast was approved by the FAA separate from the AMP and is not based on airport improvement projects. Trips generated by increased enplanements at the Airport under Background conditions were estimated based on aviation forecast projections in the Airport's updated draft Final Airport Master Plan (AMP), which represent projected aviation demand for a ten-year planning horizon. The aviation forecast projections are based on anticipated regional and national growth in aviation demand and are not due to changes in capacity at the Airport. The FAA approval letter for these forecasts, as well as a summary of the forecasts, is included in **Appendix Q**.

The Airport's enplanements, which were 197,322 in 2016, are projected to reach 245,000 in the ten-year planning horizon, representing an increase of approximately 24%. To account for this projected increase, trips generated by the Airport in 2016 (based on traffic counts at the Airport's access points) were increased by 24% to estimate the trips generated by increased enplanements in the ten-year planning horizon. As is the case with the existing trips generated by the Airport, the trips associated with the increased enplanements include trips made by employees, support services, etc.

In addition, trips from development external to the Airport were estimated based on approved projects in the study area that have not yet been constructed, and future traffic volume forecasts developed for the *SR 68 Scenic Highway Plan* study (August 2017). The *SR 68 Scenic Highway Plan* study utilized the 2014 Association of Monterey Bay Area Governments (AMBAG) Regional Travel Demand Model to project future traffic volumes along the SR 68 corridor. For the purposes of this analysis, future traffic volume projections from the *SR 68 Scenic Highway Plan* were used as the basis for future traffic volumes along the SR 68 corridor, and future traffic volumes for the remainder of the study area were developed based on the list of approved projects. A list of the approved projects, their trip generation estimates, and a map of their locations are included in **Appendix P**. Trips from increased enplanements were also added to these projected traffic volumes.

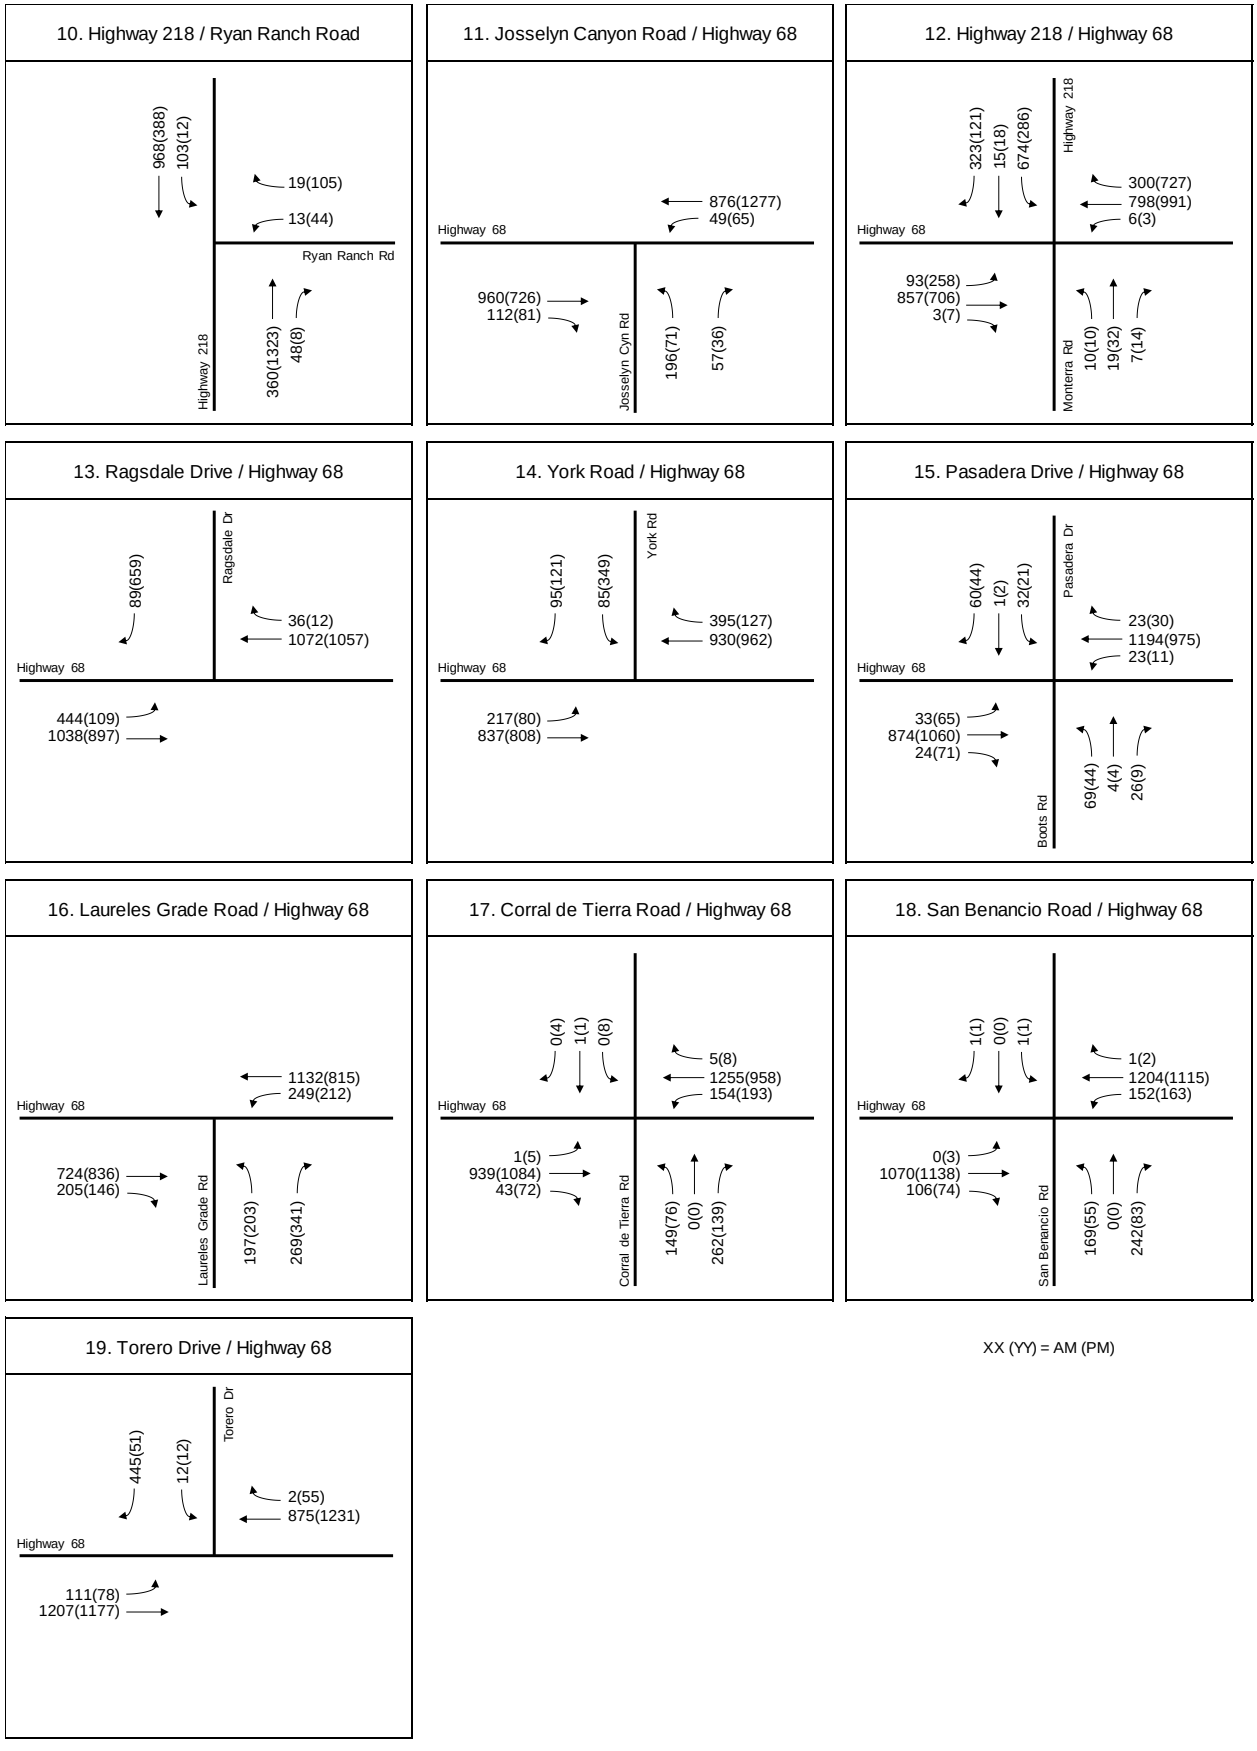
In assessing Background traffic conditions, trips from increased enplanements and from development external to the Airport were combined and added to the Existing conditions traffic volumes to obtain Background conditions traffic volumes. Background weekday AM and PM peak hour traffic volumes are shown in **Figures 24** and **25**.

Figure 24: Background Volumes (1 – 9)



XX (YY) = AM (PM)

Figure 25: Background Volumes (10 – 19)



5.2 Background Intersection Operations

Based on the City of Monterey and Caltrans level of service standards, the following study intersections are projected to operate deficiently under Background traffic conditions:

Intersection #1 – Olmsted Road / Highway 68
Intersection #6 – Del Monte Boulevard / Highway 218
Intersection #7 – Highway 218 / Fremont Boulevard
Intersection #9 – Highway 218 / Del Rey Gardens Drive
Intersection #11 – Josselyn Canyon Road / Highway 68
Intersection #14 – York Road / Highway 68
Intersection #15 – Pasadera Drive / Highway 68
Intersection #16 – Laureles Grade Road / Highway 68
Intersection #17 – Corral De Tierra Road / Highway 68
Intersection #18 – San Benancio Road / Highway 68
Intersection #19 – Torero Drive / Highway 68

Background conditions intersection levels of service are summarized in **Tables 20** and **21**. LOS calculation worksheets are included in **Appendix H**. Vehicle queue estimates are included in **Appendix I**.

5.3 Background Road Segment Operations

Road segment operations under Background traffic conditions are discussed here qualitatively. The following road segments operate deficiently under Existing conditions and would continue to operate deficiently with the added traffic under Background traffic conditions:

Segment #2 – Highway 68, from Begin/End Freeway to Josselyn Canyon Road
Segment #3 – Highway 68, from Josselyn Canyon Road to Olmsted Road
Segment #4 – Highway 68, from Olmsted Road to Highway 218
Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade
Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road
Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive
Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).

2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).

3 LOS highlighted in red indicates intersection operating below level of service standard.

4 * = delay greater than 300 seconds.

5 LOS in bold box indicates project impact.

Table 21: Background – Intersection LOS (10 – 19)

Notes:

1 Signal, roundabout and all-way stop delay is average overall delay in seconds per vehicle (sec/veh).

2 One- and two-way stop delay is worst approach delay in seconds per vehicle (sec/veh).

3 LOS highlighted in red indicates intersection operating below level of service standard.

4 * = delay greater than 300 seconds.

5 LOS in bold box indicates project impact.

6 Background Plus Project Short-Term Traffic Conditions

This section describes traffic operations in the study area under Background traffic conditions with the addition of Project traffic under the two short-term project alternatives, namely; Proposed Project Short-Term and Alternative 1 Project Short-Term traffic conditions.

6.1 Background Plus Proposed Project Short-Term Traffic Conditions

6.1.1 Background Plus Proposed Project Short-Term – Intersection Operations

The Proposed Project Short-Term trip assignments described in Section 4.1.1 were combined with the Background conditions traffic volumes to obtain Background Plus Proposed Project Short-Term AM and PM peak hour traffic volumes, which are shown in **Figures 26** and **27**.

Based on the City of Monterey and Caltrans level of service standards, the following study intersections are projected to operate deficiently under Background Plus Proposed Project Short-Term traffic conditions:

Intersection #1 – Olmsted Road / Highway 68
Intersection #6 – Del Monte Boulevard / Highway 218
Intersection #7 – Highway 218 / Fremont Boulevard
Intersection #9 – Highway 218 / Del Rey Gardens Drive
Intersection #11 – Josselyn Canyon Road / Highway 68
Intersection #14 – York Road / Highway 68
Intersection #15 – Pasadera Drive / Highway 68
Intersection #16 – Laureles Grade Road / Highway 68
Intersection #17 – Corral De Tierra Road / Highway 68
Intersection #18 – San Benancio Road / Highway 68
Intersection #19 – Torero Drive / Highway 68

It should be noted that these intersections would also operate at deficient levels of service under Background without Project conditions.

6.2 Background Plus Proposed Project Short-Term – Road Segment Operations

Road segment operations under Background Plus Project Short-Term traffic conditions are based on the analysis contained in the SR 68 Scenic Highway Plan study conducted by Kimley-Horn (August 2017). That study included a detailed analysis of the road segment operations along the SR 68 corridor under existing and future traffic conditions. As discussed in Section 4.1.1, the Proposed Project Short-Term is estimated to generate 10 net new daily trips, with 1 occurring during the AM peak hour (1 in, 0 out) and 2 occurring during the PM peak hour (1 in, 1 out). The effects of project traffic on the operations of the study segments would be negligible. As a result, study segment operations under Background Plus Project Short-Term conditions

are discussed here qualitatively. The following road segments operate deficiently under Existing conditions and would continue to operate deficiently with the added traffic under Background Plus Proposed Project Short-Term traffic conditions:

Segment #2 – Highway 68, from Begin/End Freeway to Josselyn Canyon Road

Segment #3 – Highway 68, from Josselyn Canyon Road to Olmsted Road

Segment #4 – Highway 68, from Olmsted Road to Highway 218

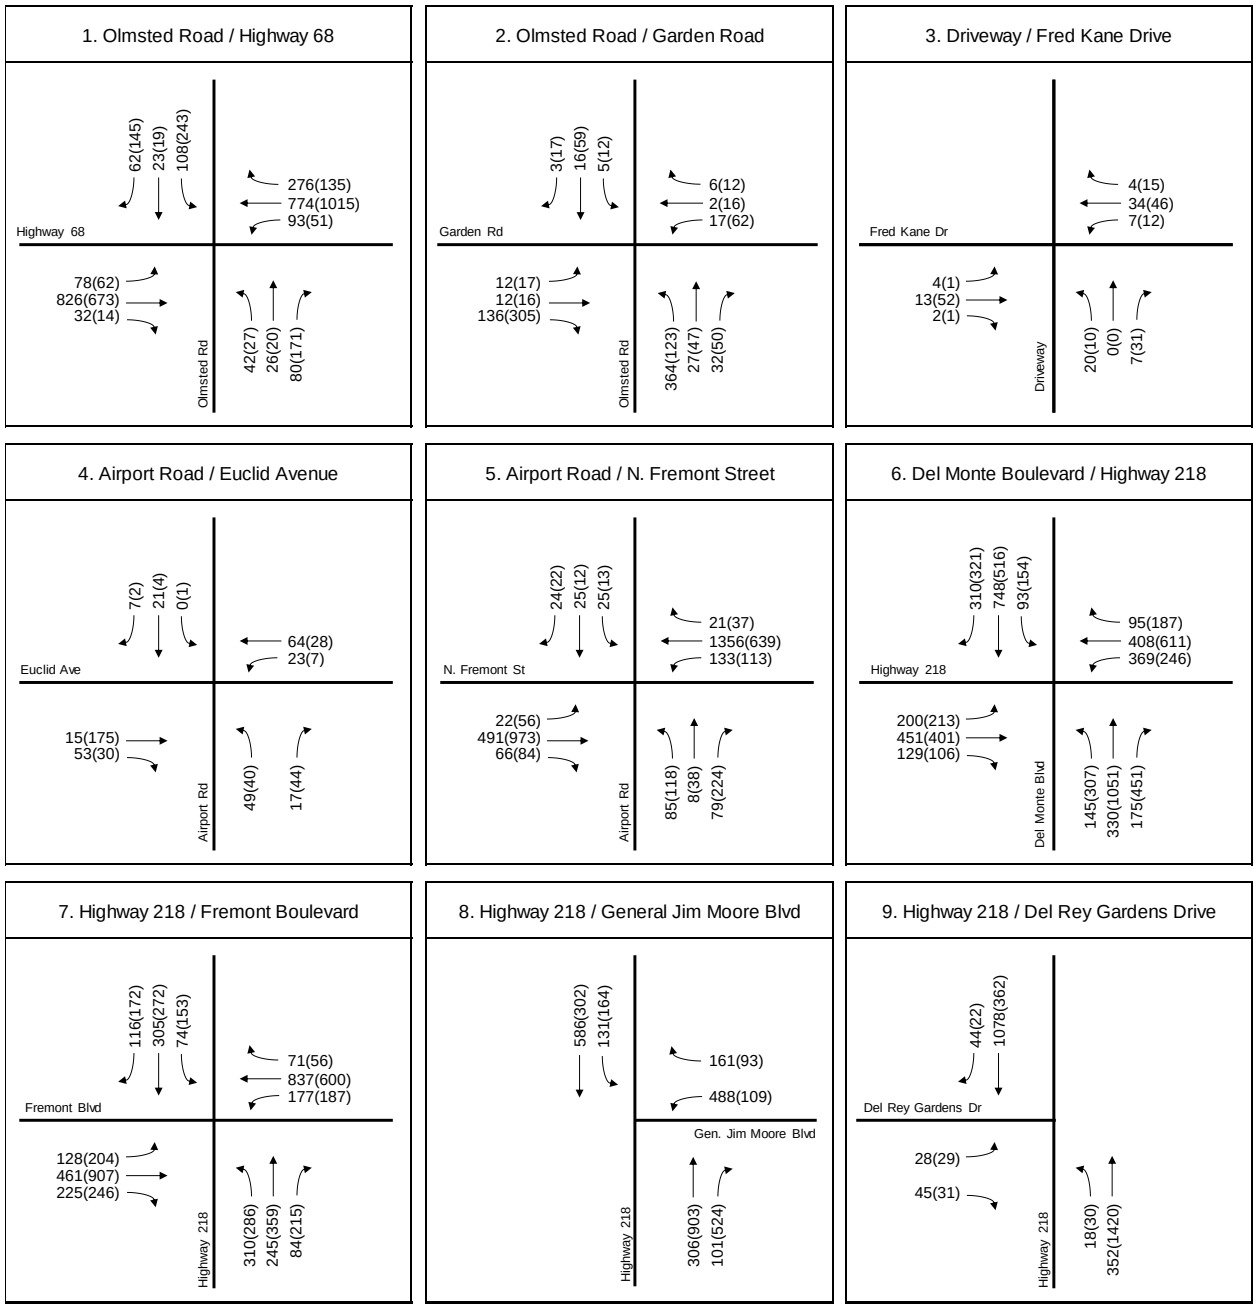
Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade

Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road

Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive

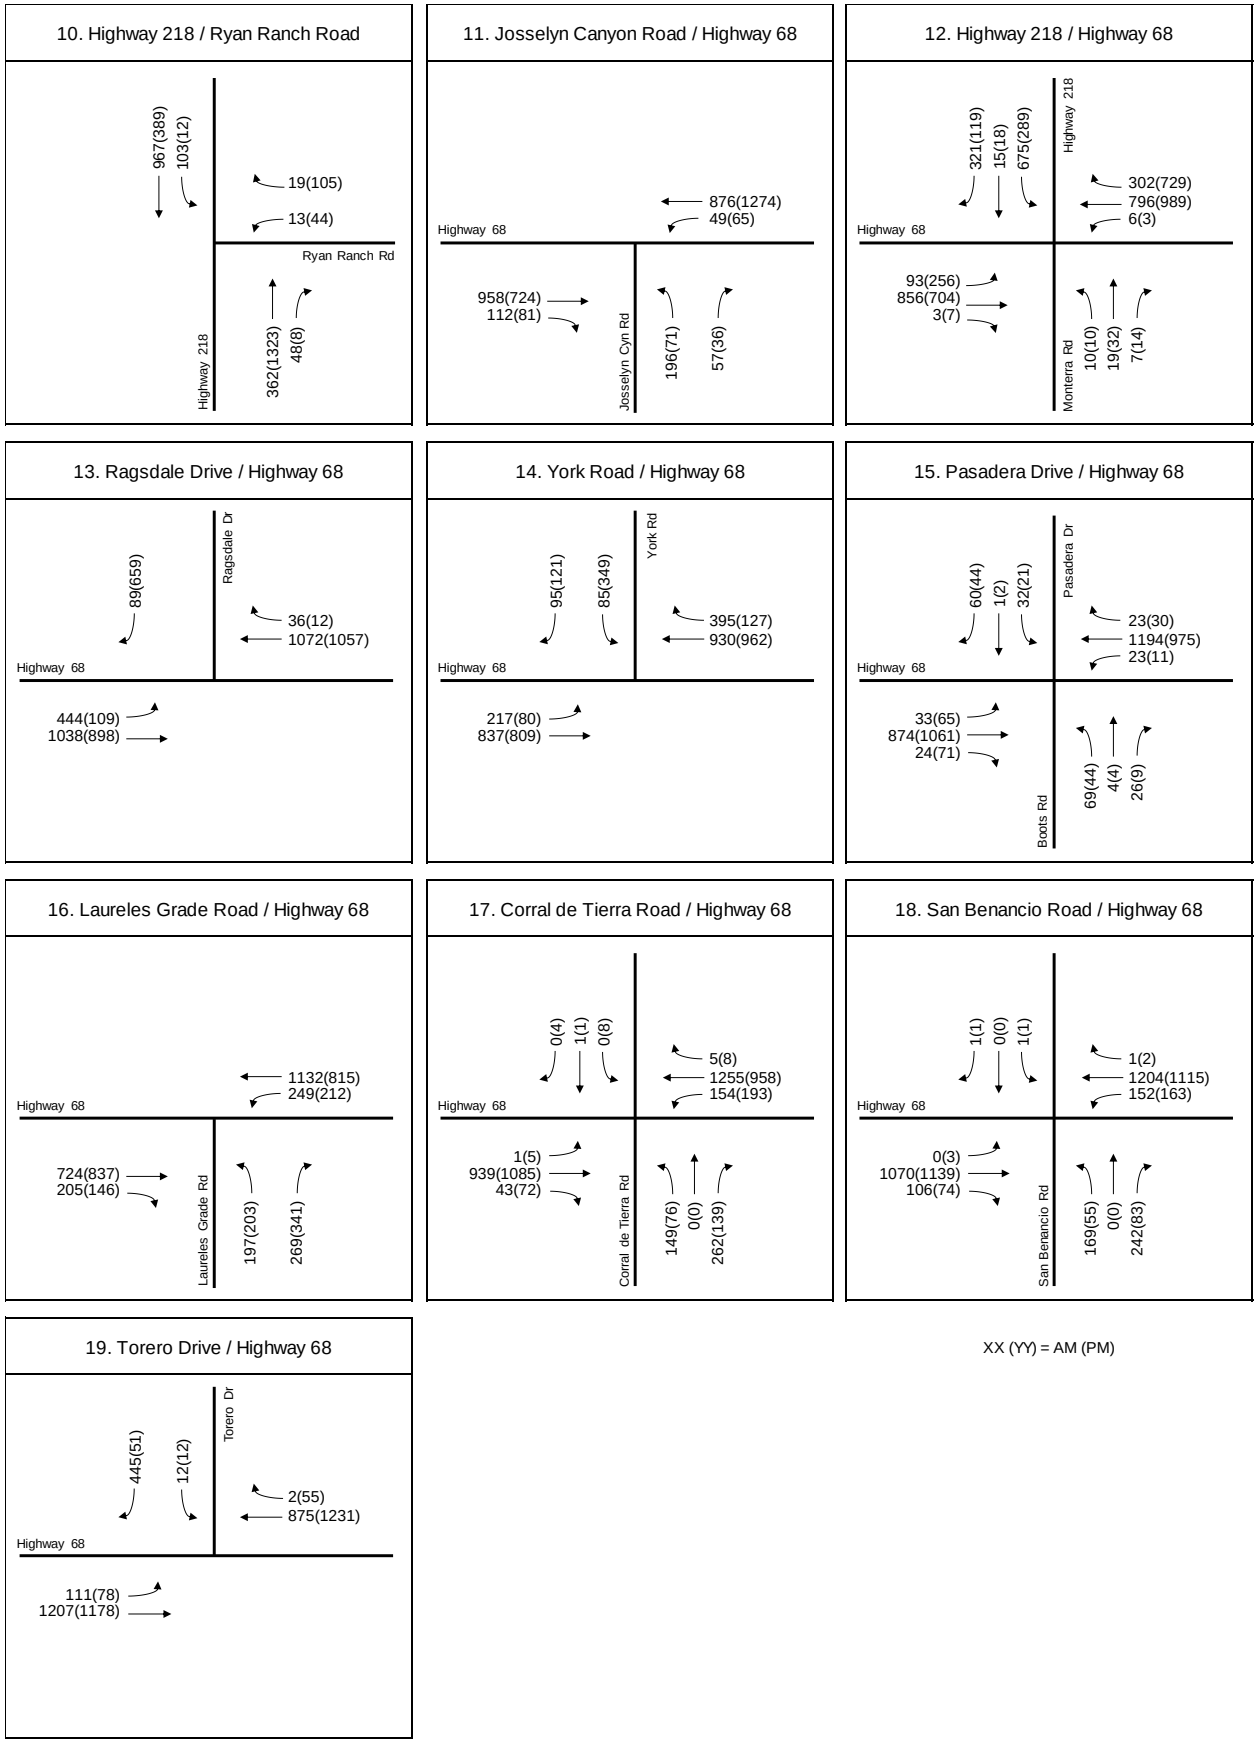
Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

Figure 26: Background Plus Proposed Project Short-Term Volumes (1 – 9)



XX (YY) = AM (PM)

Figure 27: Background Plus Proposed Project Short-Term Volumes (10 – 19)



6.2.1 Background Plus Proposed Project Short-Term – Project Impacts

Based on the criteria for project impacts, the Proposed Project would have a significant impact at the following intersections under Background Plus Proposed Project Short-Term conditions (**Tables 22** and **23**):

Intersection #6 – Del Monte Boulevard / Highway 218

Intersection #7 – Highway 218 / Fremont Boulevard

Intersection #9 – Highway 218 / Del Rey Gardens Drive

Intersection #14 – York Road / Highway 68

Intersection #16 – Laureles Grade Road / Highway 68

Intersection #17 – Corral De Tierra Road / Highway 68

Intersection #18 – San Benancio Road / Highway 68

Intersection #19 – Torero Drive / Highway 68

Based on the Caltrans impact criteria, the addition of a single project trip at an intersection that is operating deficiently can be considered an impact. Although intersections #1, #11, and #15 (all Caltrans intersections) would operate deficiently under Background Plus Proposed Project Short-Term conditions (and under Background without project conditions), the Project would not impact these intersections either because a) the redistribution of traffic that would occur with the relocation of the existing hangars would result in an overall reduction of traffic at the intersection or b) the Project is not expected to add traffic to the intersection during the peak hour that is operating deficiently. Under these circumstances, the Project would not trigger a significant impact under any of the applicable thresholds.

Based on the criteria for project impacts, the Project would have a significant impact on the following road segments under Background Plus Proposed Project Short-Term conditions:

Segment #6 – Highway 68, from Ragsdale Drive to Laureles Grade

Segment #7 – Highway 68, from Laureles Grade to Corral De Tierra Road

Segment #8 – Highway 68, from Corral De Tierra Road to Torero Drive

Segment #9 – Highway 68, from Torero Drive to Begin/End Freeway

6.2.2 Background Plus Proposed Project Short-Term – Mitigation Measures

The improvements listed below are recommended to mitigate the Project's impacts under Background Plus Proposed Project Short-Term conditions. As discussed at Draft EIR sections 4.16. and 5.5.16, and at Draft EIR Appendix N, the improvements, however, may not be feasible if disallowed by federal law; federal law states that airport revenues and Federal Aviation Administration (FAA) grant funds may not be used for purposes other than the capital or operating costs of the airport, the local airport system, or other local facilities owned or operated by the airport owner or operator that are directly and substantially related to the air transportation of passengers and property. These restrictions impact the Airport's ability to fund and implement off-airport mitigation measures. Now that the Airport has identified specific mitigation measures for Proposed Project cumulative impacts, it can make specific requests to the FAA, where appropriate, for it to allow funding of off-airport mitigation measures.

At this time, however, because the Airport does not currently have a determination from the FAA that funding for any off-airport mitigation improvements will be allowed, the following mitigation measures are considered infeasible:

Intersection #6: Del Monte Boulevard / Highway 218 – Mitigation #6

1. Add 2nd Northbound Del Monte Blvd Left-Turn Lane
2. Add Northbound Del Monte Blvd Right-Turn Overlap Phasing
3. Add Southbound Del Monte Blvd Right-Turn Overlap Phasing

Implementation of these improvements would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of these improvements, based on the relative number of project trips it would add to the intersection (1 AM and 2 PM peak hour trips).

However, these improvements would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement these improvements. In addition, even with the Project's fair-share contribution, there is no guarantee that there would be sufficient funding available to implement these improvements. This impact could be mitigated by constructing the left-turn lane and implementing overlap phasing; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #7: Highway 218 / Fremont Boulevard – Mitigation #2

1. Add 2nd Northbound Highway 218 Left-Turn Lane

Implementation of this improvement would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of this improvement, based on the relative number of project trips it would add to the intersection (5 AM and 9 PM peak hour trips).

However, this improvement would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement this improvement. In addition, even with the Project's fair-share contribution, there is no guarantee that there would be sufficient funding available to implement this improvement. This impact could be mitigated by constructing the left-turn lane; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #9: Highway 218 / Del Rey Gardens Drive – Mitigation #7

1. Signalize Intersection
2. Add 2nd Northbound Highway 218 Through Lane
3. Add 2nd Southbound Highway 218 Through Lane

Implementation of these improvements would reduce the Project's impact to a less than significant level. The project would be responsible for a fair-share contribution towards the total cost of these improvements, based on the relative number of project trips it would add to the intersection (1 AM and 1 PM peak hour trip).

However, these improvements would be to a Caltrans facility, and would have to be approved by Caltrans before implementation. It is not certain that Caltrans would agree to implement these improvements. In addition, even with the Project's fair-share contribution, there is no

guarantee that there would be sufficient funding available to implement these improvements. This impact could be mitigated by signalizing the intersection and constructing the through lanes; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.

Intersection #14: York Road / Highway 68 – Mitigation #3

1. Convert intersection to a roundabout

Conversion of this intersection to a roundabout, as proposed in TAMC's *SR 68 Scenic Highway Plan* study, would reduce the Project's impact (1 PM peak hour trip) to a less than significant level. Per the TAMC website, Measure X sales tax funds have been dedicated to the *SR 68 Scenic Highway Plan*, which is also a candidate for federal infrastructure funding and state funding from SB 1 programs. This impact could be mitigated by constructing the roundabout; however, the impact is considered significant and unavoidable at this time because the improvement necessary to reduce the significant impact is infeasible as it is within the jurisdiction and control of another agency (Caltrans) and implementation within the necessary timeframe cannot be assured.
